TO THE READER

This is the first part of our new Workshop Manual. This part, titled "Mechanism", will be supplemented by a second part titled "Disassembly and Servicing" which we hope will reach you in July, '84. We suggest that you file both parts together with the "B6200-B7200 HST Workshop Manual" which we sent you earlier.

This Workshop Manual consists of Hydrostatic Transmission and only a part of Hydraulic and Electrical system.

Please refer the Workshop Manual of B5200-B6200-B7200 of mechanical transmission type, concerning the other sections.

May,'84

F FEATURES

[1] Engine cylinder displacement is increased to augment its output.

[2] The hydraulic pump delivery is increased 25% (compared with B6100-B7100 HST) to take care of front loader and other implements.

[3] The fuel tank capacity is increased to permit longer hours of continuous operation. The metallic tank is tough and durable.

[4] The fuel gauge constantly reminds the user of the remaining amount of fuel.

[5] The seat is newly styled and engineered for greater comfort.

[6] The operator's area is enlarged to allow the user to operate in a less-tiring posture.

[7] The spring-suspended seat absorbs shock from the ground to reduce fatigue.

[8] The seat can be easily shifted back and forth so you can select the seat position that is most comfortable.

[9] The fender edge is rolled back to prevent injury during tire replacement.

[10] The position control for the hydraulic unit greatly improves maneuverability. This feature is available for B6200 HST 4WD and B7200 HST 4WD.

[11] Rear hydraulic outlet is provided under the operator's seat. With the outlet valve (optional), implement operations are greatly assisted.

[12] The hydraulic block type outlet for the front loader is provided at the right side of the tractor.

[13] The wheelbase is lengthened to receive the 60 inch mid-mounting mower for greater mowing capability.

[14] A bevel gear type front axle is adapted. Engine output is transmitted to the front wheels for powerful, smooth driving action. This feature is available for B7200 HST 4WD only.

[15] The side and front of the tractor, near the engine, are each fitted with a safety cover. This safety feature prevents burns and other accidents caused by touching the rotating or hot parts of the engine.

[16] Optional ROPS is recommended for added safety. It can be attached any time.
The transmission consists of HST (Hydrostatic Transmission) and a series of gears shown previously. It offers the most suitable speeds for traveling and operation by combination of them. And power is transmitted to the front or rear axles and the PTO shafts, which are classified respectively as the traveling system and PTO system.

The traveling system consists of the HST (A), high-low gear shift section (C) and front wheel drive section (E). The traveling speeds are selected by the operation of the speed control pedal and the high-low gear shift lever.

(10) Neutral Valve (Reverse)
(11) Pump Kidney Port B
(12) Input Shaft
(13) Case Relief Valve
(14) Motor Kidney Port D
(15) High Pressure Relief Valve
(2) Pump and Motor

Pump and motor cylinder, each containing pistons, are connected by lines. Cylinders and lines are filled with oil. Pistons ride against swashplates located in pump and motor.

In the pump, as the cylinder rotates, pistons move across the sloping face of swashplate and slide in or out of their cylinder bores.

The oil, forced out by the pump pistons, causes the motor pistons to slide out of their cylinder bores. In the motor, sliding out of the cylinder and moving across the sloping face of swashplate, the pistons rotate the cylinder.

(2) Variable Swashplate

This pump is variable displacement one. The angle of its swashplate can be varied so that the volume and pressure of oil pumped by the pistons can be changed or the direction of oil flow can be reversed. The swashplate is moved around the trunnion shaft with the neutral holder, by stepping on the speed control pedal linked to the neutral holder.
(4) Oil Flow and Valves

P1: Port for checking high pressure (forward)
P2: Port for checking high pressure (reverse)
P3: Port for checking case pressure

P4: Port for checking vacuum
P5: Port for checking case pressure

The pump and motor are joined in a closed hydraulic loop and most of oil circulates within the main oil circuit. A little oil lubricates and oozes out from the clearance between the moving parts to the case. Then oil in the main oil circuit of the hydrostatic transmission needs to be supplied a want. So all of oil fed from the main hydraulic pump flows to the hydrostatic transmission for charging.

Only return oil from the hydraulic cylinder drops to the transmission case.
The charge oil aids smooth operation of piston pump and motor. The rest of the oil passes through the charge relief valve into the case. Then the oil passes to the main hydraulic pump through a cooler.
1. Charge Relief Valve

While pumped and filtered oil flows into the main oil circuit through the check valves, excessive oil passes to the case through the charge relief valve.

<table>
<thead>

</tr>
<tr>
<td></td>
<td>(4.3 to 5.7 kgf/cm², 61 to 81 psi)</td>
</tr>
<tr>
<td></td>
<td>more than case pressure</td>
</tr>
</tbody>
</table>

2. Neutral Valve

The neutral valves in the main oil circuit lines are open and pass the oil to the case when in neutral, and the oil pressure in their lines becomes low. And when the oil pressure in the high pressure line increases to a specified pressure, the neutral valve closes.

<table>
<thead>
<tr>
<th>Valve operating pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approx. 3.24 MPa (33 kgf/cm², 469 psi)</td>
</tr>
</tbody>
</table>
3. High Pressure Relief Valve

The high pressure relief valve between the two lines in the main oil circuit monitors the oil pressure in each line. When excessively high pressure is built up in one line, it opens and flows the oil into another line.

<table>
<thead>
<tr>
<th>Oil temperature</th>
<th>Valve operating pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>25°C to 50°C (77°F to 122°F)</td>
<td>22.5 to 24.5 MPa (230 to 250 kgf/cm², 3270 to 3560 psi)</td>
</tr>
</tbody>
</table>

4. Case Relief Valve

The case relief valve monitors the oil pressure in the hydrostatic transmission case. When the oil pressure rises, it opens and flows the oil directly to the transmission case, so that the oil may not leak against the sealings.

<table>
<thead>
<tr>
<th>Oil temperature</th>
<th>Valve operating pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>25°C to 50°C (77°F to 122°F)</td>
<td>170 to 230 kPa (1.7 to 2.3 kgf/cm², 24 to 32 psi)</td>
</tr>
</tbody>
</table>
(5) Operation

Neutral

When the speed control pedal is in neutral, the variable swashplate is at right angles to the pump pistons and they only rotate with cylinder block without reciprocating. Since the oil is not being pumped to the motor, the cylinder block in the motor is stationary and the output shaft does not move.
Forward

When the speed control pedal is stepped on and in forward, the variable swashplate is tilted as shown in figure above.

As the pump cylinder block rotates with the input shaft, oil is forced out of pump kidney port A at high pressure. As pressure oil enters motor kidney port C, the pistons, which align with port C, are pushed against the swashplate and slide down the inclined surface.

Then the output shaft rotates with the motor cylinder block. This drives the machine forward and the angle of pump swashplate determines the output shaft speed.

As the motor cylinder block continues to rotate, oil is forced out of motor kidney port D at low pressure and returns to the pump.
When the speed control pedal is stepped on and in reverse, the variable swashplate is tilted as shown in figure above. As the pump cylinder block rotates with the input shaft, oil is forced out of pump kidney port B at high pressure. As pressure oil enters motor kidney port D, the pistons, which align with port D, are pushed against the swashplate and slide down the inclined surface.

Then the output shaft rotates with the motor cylinder block. This drives the machine rearward and the angle of pump swashplate determines the output shaft speed. As the motor cylinder block continues to rotate, oil is forced out of motor kidney port C at low pressure and returns to the pump.
(6) Control Linkage

The speed control pedal (6) and the trunnion shaft of variable swashplate are linked with the rod guide (3), the speed control rod (2) and the neutral holder (1). As the front footrest of the pedal is depressed, the swashplate rotates and forward traveling speed increases. Depressing the rear footrest increases reverse speed.

The roller (8) on the neutral holder arm (7) hanged with spring seats the detent of the neutral holder (1) so that the neutral holder returns to neutral.

Then, the swashplate is returned to neutral with the neutral holder, when the pedal is released. The damper (5) connected to the rod guide (3) restricts the movement of the linkage to prevent abrupt operation or reversing.

The speed set device (4) linked to the rod guide (3) enables the linkage not to return to neutral and to keep a certain forward speed while the speed control pedal (6) is released.

On B6200HST, this device is installed as optional.

(1) High-Low Gear Shift Section

Mechanical transmission receives engine power from the output shaft of hydrostatic transmission and selects high or low gear, and transmits the power to differential.

Neutral

High or low speed is obtained by shifting 20T-12T gear (9) splined to spiral bevel pinion (10). When in neutral, neither 15T gear (4) nor 23T gear (5) meshes with 20T-12T gear (9) on spiral bevel pinion (10).

Engine power is transmitted to the output shaft (8) of hydrostatic transmission, to which 16T gear (7) is splined. 16T gear (7) and 14T gear (1) are in mesh. 14T gear (1) is splined to 2nd shaft (2). Integral 11T gear on 2nd shaft (2) and 24T gear (3) are in mesh. 24T gear (3) is splined to 4th shaft (6). To 4th shaft (6), 15T gear (4) and 23T gear (5) are also splined. Spiral bevel pinion (10) is not driven.
Low

(1) 15T Gear  (2) 20T-12T Gear  (3) Spiral Bevel Pinion

20T-12T gear (2) is shifted and 20T gear meshes with 15T gear (1) splined to spiral bevel pinion (3). Then power is transmitted to differential.

High

(1) 23T Gear  (2) 20T-12T Gear  (3) Spiral Bevel Pinion

20T-12T gear (2) is shifted and 12T gear meshes with 23T gear (1) splined to spiral bevel pinion (3). Then power is transmitted to differential.
The front wheel drive is used when greater traction power is required or to prevent the tractor from being pushed during rotary tilling of hard soil. 2-wheel drive or 4-wheel drive is selected by changing position of 24T gear (4) on the front wheel drive shaft (3) with the front drive lever. When the front drive lever is set to "Disengaged", 24T gear is in neutral and power is not transmitted to the front drive shaft.

When the front drive lever is set to "Engaged", 24T gear slides rearward to engage with 16T gear (5) on the spiral bevel pinion shaft (6). Therefore, the front drive shaft is actuated to drive the front wheels.
(3) PTO Shift Section

PTO system is independent of HST. Engine revolution is directly transmitted to the 2nd shaft (4).

1) Neutral
The 14T gear (2) meshes with the 21T gear (5) on the 3rd shaft (8). And the 18T gear (3) meshes with the 17T gear (9) on the 3rd shaft (8), too. But the 21T gear (5) and the 17T gear (9) unite with needle bearing in itself, they run idle on the 3rd shaft (8). Then the 3rd shaft (8) is not driven.

2) 1st Position
The 21T gear (7) splined to the 3rd shaft (8) is shifted forward, and then the 3rd shaft (8) is rotated. The power train is shown in the figure above. Rear PTO shaft (10) speed is 540rpm at an engine speed of 2517rpm. Mid PTO shaft (6) speed is 1946rpm at an engine speed of 2517rpm.

3) 2nd Position
The 21T gear (7) shifted to the 3rd shaft (8) is shifted rearward, and then the 3rd shaft (8) is rotated. The power train is shown in the figure above. Rear PTO shaft (10) speed is 838rpm at an engine speed of 2517rpm. Mid PTO shaft (6) speed is 2456rpm at an engine speed of 2517rpm.
(4) One-Way Clutch Cam Section

(1) 3rd Shaft
(2) Clutch Cam
(3) Clutch Cam
(4) Cam Spring
(5) 5th Shaft

The one-way clutch cam is also called an overrunning clutch. It is composed of a pair of clutch cams (2), (3) and a cam spring (4). One of the clutch cams is splined to the 3rd shaft (1), and the other is splined to the 5th shaft (5).

These two clutch cams are engaged with each other by the force of the cam spring. As long as the 3rd shaft is rotating faster than the 5th shaft, these two clutch cams will remain engaged, and the 5th shaft is driven.
This tractor uses hydraulics to control mounted equipment and to transmit engine power for traveling. Hydraulic system is composed of oil reservoir (transmission case) (2), strainers (7), (8), hydraulic pump (5), hydraulic block type outlet (10), control valve (3), integral lift arm cylinder of case rear cover (1), oil filter (4), hydrostatic transmission (9) and oil cooler (6).

Equipment control system is described here, but not hydraulic transmission system, which is referred to "TRANSMISSION". Hydraulic oil is drawn from the bottom of transmission case (2) through the strainer (7) by the hydraulic pump (5) and fed to the control valve (3) through the hydraulic block type outlet (10). One relief valve is built in the control valve.
(1) Radiator  
(2) Oil Cooler

Hydrostatic transmission produces the heat more than normal circulation of oil dissipates, then this tractor is equipped with a oil cooler. The oil cooler is located in front of the engine radiator and of air-to-oil type, so that air blast by fan dissipates the heat from oil through the oil tubes with fin of the cooler.

[7] SPECIAL TOOLS................................ S.G-20
1. TRACTOR IDENTIFICATION

When contacting your local KUBOTA distributor, always specify tractor serial number and hourmeter reading.
[2] GENERAL PRECAUTIONS

- During disassembly, carefully arrange removed parts in a clean area to prevent confusion later. Bolts and nuts should be installed in their original position to prevent reassembly errors.
- When special tools are required, use KUBOTA genuine special tools. Special tools which are not frequently used should be made according to the drawings provided.
- Before disassembling or servicing electrical wires, always disconnect the ground cable from the battery first.
- Remove oil and dirt from parts before measuring.
- Use only KUBOTA genuine parts for parts replacement to maintain tractor performance and to assure safety.

- Gaskets and O-rings must be replaced during reassembly. Apply grease to new O-ring or oil seals before assembling. See the figure below.
- When reassembling external circlips or internal circlips, they must be positioned so that sharp edge faces against the direction from which force is applied. See the figure below.
- When inserting spring pins, their splits must face the direction from which a force is applied. See the figure below.
- To prevent damage to the hydraulic system, use only specified fluid or equivalent.

</table>
Changing Engine Oil
1. Start and warm up the engine for approx. 5 minutes.
2. Remove the drain plug (1) to drain oil.
3. Screw in the drain plug.
4. Fill new oil up to the upper line on the dipstick (3).
Refer to "LUBRICANTS". (See page S.G-3)

(1) Drain Plug
(2) Oil Port Plug
(3) Dipstick

Replacing Engine Oil Filter Cartridge
⚠️ CAUTION
- Be sure to stop the engine before replacing the oil filter cartridge.

1. Remove the engine oil filter cartridge.
2. When installing, apply engine oil slightly to the rubber gasket.
3. To install a new cartridge, screw it in by hand. Overtightening may deform the rubber gasket.
4. After the cartridge has been replaced, the engine oil normally decreases a little. So replenish engine oil up to the specified level.

⚠️ IMPORTANT
- To prevent serious damage to the engine, the element must be highly efficient. Use only genuine filters.
(2) Check Points of Initial 50 Hours

**Changing Transmission Oil**
1. Remove the drain plugs (1) to drain transmission oil.
2. Screw in the drain plugs.
3. Fill new oil up to the upper line on the dipstick (2).

**IMPORTANT**
- Use only multi-grade transmission fluid. Use of other oils may damage the transmission or hydraulic system. Refer to "LUBRICANTS". (See page S.G-3)

(1) Drain Plug  
(2) Dipstick  
(3) Oil Port Plug

**Cleaning Oil Strainer**
1. Remove the oil strainer (1).
2. Rinse the oil strainer with kerosene to completely clean off dust.

(1) Oil Strainer
Replacing Transmission Oil Filter Cartridge

**CAUTION**
- Be sure to stop the engine before replacing the oil filter cartridge.

1. The oil filter cartridge must be replaced after initial 50 hours and every 200 service hours.
2. Remove the 4 bolts which secure the cover.
3. Remove the oil filter cartridge by using the filter wrench.
4. Lightly tighten the screw (A) by using a screwdriver.
5. Apply a slight coat of oil onto the cartridge gasket.
6. To install the new cartridge, screw it in by hand. Over tightening may cause deformation of rubber gasket.
7. After the new cartridge has been replaced, the transmission oil level will become a little lower. Make sure that the transmission oil does not leak through the seal. Check the oil level.

1) Filter Cartridge

**IMPORTANT**
- To prevent serious damage to hydraulic system, replacement of filter must be a highly efficient, 10 µm filter. Use only a KUBOTA genuine filter or its equivalent.
- When using the auxiliary hydraulics, replace the transmission oil filter cartridge after initial 50 service hours.

(3) Check Points of Every 75 Hours

**Changing Engine Oil**
1. See page S.G-6.

1) Drain Plug
2) Oil Port Plug
3) Dipstick
(4) Check Points of Every 100 Hours

Greasing Points
1. Grease the following points.
   - King pins (2WD Type)
   - Center pin (2WD Type)
   - Clutch pedal shaft
   - Brake pedal shaft
   - Speed control pedal shaft
   - Clutch release hub

- King Pins
- Center Pin
- Clutch Pedal Shaft
- Brake Pedal Shaft
- Speed Control Pedal Shaft
- Clutch Release Hub
Checking Clamps
1. Check the following points to be connected securely.
   - Hydraulic inlet line clamps
   - Fuel line clamps

Hydraulic Inlet Line Clamps

Fuel Line Clamps

Cleaning Air Cleaner Element
1. To clean the element, use clean dry compressed air on the inside of the element. Air pressure at the nozzle must not exceed 205 kPa (2.1 kgf/cm², 30 psi).
   Maintain reasonable distance between the nozzle and the element.
2. To wash the element, use KUBOTA Filter of Donaldson ND-1500 Filter Cleaner which is especially effective on oily and soot-laden filters.
   To use: Dissolve KUBOTA Filter Cleaner in a concentrated solution of cold water. When granules are thoroughly mixed, add water to make a solution equivalent to 15 g KUBOTA Filter Cleaner for each 1 quart (1 gallon) of water. (2 oz KUBOTA Filter Cleaner for each 1 gallon of water.)
   Allow element to soak 15 minutes. Then agitate element to dislodge loosened dust-rinse in clear water-allow element to dry.
Cleaning Fuel Filter
1. Close the fuel filter cock (1).
2. Unscrew the screw ring (4) and remove the filter bowl (3), and rinse the inside with kerosene.
3. Take out the element (2) and dip it in the kerosene to rinse.
4. After cleaning, reassemble the fuel filter, keeping out dust and dirt.

**IMPORTANT**
- If dust and dirt enter the fuel, the injection pump and injection nozzle are subject to quick wear.
  To prevent this, be sure to clean the fuel filter bowl periodically.

(1) Fuel Filter Cock
(2) Element
(3) Filter Bowl
(4) Screw Ring

Checking Fuel Line

**CAUTION**
- Stop the engine when attempting the check as prescribed below.
- Never fail to check the fuel line periodically.
  The fuel line is subject to wear and aging, fuel may leak out onto the running engine, causing a fire.

1. Check the fuel line.
2. If the clamp is loose, apply a slight coat of lubricant onto the threads and securely retighten it.
3. If the fuel pipe and clamp are found damaged or deteriorated, replace or remedy.

Checking Battery Electrolyte Level

**CAUTION**
- Never remove the battery cap while the engine is running.
- Keep electrolyte away from eyes, hands and clothes. If you are spattered with it, wash it away completely with water.

1. Check that the battery electrolyte level is between the lowest and highest levels.
2. If insufficient, add distilled water.
Checking Fan Drive Belt Tension
1. Press the fan drive belt with a force of approx. 38.8 to 68.6 N (6 to 7 kgf, 13.2 to 15.4 lbs), and measure the deflection.
2. If the measurement is not the factory specification, adjust the fan drive belt tension.

Fan drive belt tension
Factory specification........ 7 to 9 mm
0.276 to 0.354 in.

■ NOTE
- When the tractor is stored for long periods, be sure to loosen the fan drive belt.

Checking Clutch Pedal Play
1. Depress the clutch pedal by hand, and measure the amount of pedal movement at the footrest.
2. If the measurement is not within the factory specifications, adjust the play by changing the length of rod (1).

Clutch pedal play
Factory specification........ 20 to 30 mm
0.79 to 1.18 in.
Checking Brake Pedal Play
1. Press each of brake pedals five times with a force of 167 to 294 N (15 to 30 kgf, 33 to 66 lbs).
2. Press the center of the pedal at a force of 39 to 58 N (4 to 6 kgf, 9 to 13 lbs), and measure the movement at the footrest of pedal.
3. If the measurement is not within the factory specifications, turn the turnbuckle of brake rod to adjust.

Brake pedal play
Factory specification........ 20 to 30 mm
0.79 to 1.18 in.

■ NOTE
- The difference between the left and right pedal plays must be less than 4 mm (0.157 in.).
- After adjustment, secure the turnbuckle with the lock nut.

Checking Steering Wheel Play
1. Turn the front wheels straight ahead.
2. Measure the play with a scale.
3. If the measurement is not within the factory specifications, loosen the lock nut, and turn the adjusting screw with a screwdriver to adjust.

Play of steering wheel
Factory specification........ 20 to 50 mm
0.79 to 1.96 in.

■ NOTE
- When the play is excessive, turn the adjusting screw clockwise, and when too little, counterclockwise.
- After adjustment, secure the adjusting screw with the lock nut.
(5) Check Points of Every 150 Hours

Replacing Engine Oil Filter Cartridge
1. See page S.G-6.

Checking Water Pipes and Clamps
1. Check the water pipes and the clamps.
2. If the clamp is loose, apply a slight coat of lubricant onto the threads and securely retighten it.
3. If the water pipe and clamp are found damaged or deteriorated, replace or remedy.

(6) Check Points of every 200 Hours

Replacing Transmission Oil Filter Cartridge
1. See page S.G-8.
(7) Check Points of Every 300 Hours

Changing Transmission Oil

(1) Drain Plug
(2) Dipstick
(3) Oil Port Plug

Changing Front Axle Case Oil (B6200 HST 4WD) and Front Axle Arm Oil (B7200 HST 4WD)
1. Remove the drain plug (2) from the front axle case to drain oil. (B6200 HST 4WD)
2. Remove the drain plug (4) from the front axle arm to drain oil. (B7200 HST 4WD)
3. Screw in the drain plug.
4. Fill new oil up to the specified level.
Refer to "LUBRICANTS". (See page S.G-3)

NOTE
- Remove the filling port plug (1) or (3) to drain oil completely.

(1) Filling Port Plug
(2) Drain Plug
(3) Filling Port Plug
(4) Drain Plug
Changing Gear Case Oil (B6200 HST 4WD) and Front Axle Case Oil (B7200 HST 4WD)
1. Remove the drain plug (2) from the gear case to drain oil. (B6200 HST 4WD)
2. Remove the drain plug (4) from the front axle case to drain oil. (B7200 HST 4WD)
3. Screw in the drain plug.
4. Fill new oil up to the specified level.
Refer to "LUBRICANTS". (See page S.G-3)

- **NOTE**
  - Remove the filling port plug (1) or (3) to drain oil completely.

(8) Check Points of Every 400 Hours

Replacing Fuel Filter
1. Close the fuel filter cock (1).
2. Unscrew the screw ring (4) and remove the filter bowl (3).
3. Take out the element (2) and replace it with new one.

- **IMPORTANT**
  - Use only genuine fuel filters.

- Fuel Filter Cock
- Element
- Filter Bowl
- Screw Ring

(9) Check Points of Every 500 Hours

Cleaning Cooling System
1. The engine cooling system should be cleaned on the following occasions:
   - Every 500 service hours.
   - When adding an anti-freeze solution.
   - When changing from water containing anti-freeze to pure water.
2. When cleaning the engine cooling system, the KUBOTA Scale Inhibitor No. 20 is recommended to effectively wash away the scale built-up.
(10) Check Points of Every One to Two Months

Charging Battery
1. If the battery is weak, the engine is difficult to start and the lamps become dim. It is important to check the battery and recharge before trouble occurs.
2. The water in the electrolyte evaporates during recharging. Liquid shortage damages the battery and excessive liquid spills over and damages the tractor body. If low, be sure to fill up the battery with distilled water.
3. To slow charge the battery connect the battery positive terminal to the charger positive terminal and the negative to the negative, then recharge in the standard fashion.
4. A boost charge is only for emergencies. It partially charges the battery at a high rate and in a short time. When using a boost-charged battery, it is necessary to recharge the battery as early as possible after the operation has been finished. Failure to do this extremely affects the service life due to overdischarge.

(11) Check Points of Every 3 Months

Changing Scale Inhibitor and Coolant
1. To drain the used coolant, remove the drain plug (2) and radiator cap (1).
2. Clean the radiator interior, and screw in the drain plug.
3. Fill clean and fresh water up to the specified level.

■ IMPORTANT
- After changing coolant, securely tighten the radiator cap.

(1) Radiator Cap
(2) Drain Plug

(Reference)
KUBOTA Scale Inhibitor No. 11
- The KUBOTA Scale Inhibitor No. 11 prevents scale formation in the coolant. Scale which builds up in either hard or soft water sharply reduces cooling efficiency.
- The scale inhibitor is effective for 3 months, so a complete change of coolant must be done every 3 months.
- Do not use a scale inhibitor and an anti-freeze at the same time. This may cause sludge to form, adversely affecting the engine parts.
(12) Check Points of Every Year or Every 6 Times of Cleaning

Replacing Air Cleaner Element
1. Replace the air cleaner element yearly or after every sixth cleaning, whichever comes first.
2. If the element is stained with the carbon or oil, replace it.

- NOTE
  - Be sure to refit the dust cup with the arrow (on the rear) upright. If the dust cup is improperly fitted, dust passes by the dust cup and directly adheres to the element.
  - Do not run the engine with filter element removed.

(13) Check Points of Every Year

Changing Anti-freeze and Coolant
1. To drain the used coolant, remove the drain plug (2) and radiator cap (1).
2. Clean the radiator interior, and screw in the drain plug.
3. Fill clean and fresh water up to the specified level.

- IMPORTANT
  - After changing coolant, securely tighten the radiator cap.

(1) Radiator Cap
(2) Drain Plug

(Reference)

Anti-freeze
- There are two types of antifreeze solutions, permanent type (PT) and semi-permanent type (SPT). For the engines, be sure to use the permanent type.
- Use a 50/50 mix of anti-freeze and water all year round.
- When antifreeze is used for the first time, fill and drain clean water twice or three times so as to completely clean the inside of the radiator.
- Radiator should be filled with antifreeze and water solution as recommended by the anti-freeze manufacturer.
- Mix the antifreeze and water, then pour the mixture into the radiator.

- When the coolant mixed with anti-freeze decreases due to evaporation, replenish with water only. If loss has been due to leaking, add water and anti-freeze mixture with the same mix ratio as the original preparation.
- Antifreeze absorbs moisture, so be sure to securely close the container after use.
- Antifreeze and water should be changed every year.
- Do not use an antifreeze and a scale inhibitor at the same time. This may cause sludge to form, adversely affecting the engine parts.
(14) Check Points of Every 2 Years

Replacing Battery
1. Check the battery.
2. If it is defective, replace with a new one (65 Ah equivalent).

Replacing Water Pipes and Clamps
1. Replace the water pipes and clamps with a new one.

Replacing Fuel Line and Clamps
1. Replace the fuel line and clamps with a new one.
(15) Check Points of Every 800 Hours

Checking Valve Clearance

Valve clearance
Factory specification........ 0.145 to 0.185 mm
0.0057 to 0.0073 in.
(16) Original Charge of Dry Type Battery

1. Remove vent plugs and discard temporary sealing card-boards and tapes.
2. Fill each cell with electrolyte having a specific gravity given in Table 1 up to highest level marked on the battery case side.
3. After standing 2 or 3 hours, correct the electrolyte to the former level.
4. Connect the battery positive terminal with the positive terminal of the charging unit, and the battery negative terminal with the negative terminal of the charging unit.
5. Batteries are preferably charged by current showed in Table 2. Keep vent plugs removed during charging.
6. Check temperature of electrolyte, if it reaches 40°C (105°F) lower the charging rate. When the temperature is too high, reduce charging rate and charge for a proportionately longer period.

7. If the tractor is stored after original charge, periodically recharge as shown in Table 3. A battery is fully charged when the cells are all gassing freely and the specific gravity ceases to rise for three consecutive readings taken at hour intervals. Specific gravity should be adjusted to that shown in Table 1.
8. Check electrolyte level two hours after charging is finished and correct it if necessary by adding distilled water.

⚠️ CAUTION

- After the battery is activated, hydrogen and oxygen gases in the battery are very explosive. Keep open sparks and flames away from the battery at all times, especially when charging the battery.
- Keep electrolyte away from eyes, hands and clothes. If you are spattered with it, wash it away completely with water.

[7] SPECIAL TOOLS

Special-use Puller Set
Code No. : 07916-09032
Application : Use exclusively for pulling out bearings, gears and other parts with ease.

Pitman Arm Puller
Code No. : 07909-39011
Application : Use for pulling out pitman arm from tractor.

Tie Rod End Lifter
Code No. : 07909-39021
Application : This allows easy removal of tie rod end from tractor.

Steering Wheel Puller
Code No. : 07916-51090
Application : This allows easy removal of steering wheel without damaging steering shaft.
For B and L series tractors, set wheel support I (1) or wheel support II (2).

(1) Wheel Support I
(2) Wheel Support II
**Clutch Center Tool (For B Series Tractor)**
Code No. : 07906-50032  
Application : Use to fit clutch to flywheel and also to check and adjust release lever height.

**Clutch Center Tool (For B and L Series Tractors)**
Code No. : 07916-51050  
Application : The clutch center tool can be used for all B and L series tractors with a diaphragm clutch by changing tip guides.

**Bushing Puller Set**
Code No. : 07916-51031  
Application : Use for pulling out the front axle support bushing from the front axle.

**Camber, Caster and King Pin Gauge**
Code No. : 07909-31691  
Application : This allows easy measurement of camber angle, caster angle and king pin inclination for all tractor models.
**Turning Radius Gauge**
Code No. : 07909-31701
Application: This allows easy measurement of steering angle for all tractor models.

**Toe-in Gauge**
Code No. : 07909-31681
Application: This allows easy measurement of toe-in for all tractor models.

**Injector**
Code No. : 07916-52501
Application: If more traction is required, liquid (water) can be injected into the tires in addition to the weights.
**Relief Valve Set Pressure Tester**
Code No.: 07916-50044
Application: This allows easy measurement of relief set pressure for all tractor models.

1. Pressure Gauge 07916-50321
2. Cable 07916-50331
3. Connector 4 07916-50401
4. Connector 3 07916-50341
5. Adaptor B (M18, P1.5) 07916-50361
6. Adaptor C (PS 3/8) 07916-50371
7. Adaptor D (PT 1/8) 07916-50381
8. Adaptor E (PS 3/8) 07916-50392

**Hydrostatic Transmission Testing Kit**
Code No.: 07916-52040
Application: This allows easy measurement of hydrostatic transmission pressure for B6200-B7200 HST tractor.

1. Cable 07916-50331
2. Pressure Gauge (Low pressure) 07916-51301
3. Vacuum Gauge 07916-51331
4. Pressure Gauge (High pressure) 07916-50322
5. Threaded Joint in Relief Valve Set Pressure Tester 07916-50401
6. Gasket 04714-00200
7. Connector 1 07916-60811
8. Connector 2 07916-60821
9. Threaded Joint 07916-50341
10. Long Connector 07916-60831

DISASSEMBLY AND ASSEMBLY

[1] DRAINING COOLING WATER AND OIL

Draining Cooling Water

⚠️ CAUTION
- Never open the radiator cap while operating or immediately after stopping. Otherwise, hot water will spout out from the radiator. Wait for more than ten minutes to cool the radiator, before opening the cap.

1. Remove the drain plug (2) from the radiator to drain cooling water.

(Capacity)
- B6200 HST (4WD).............. 2.8 l (3.0 U.S.qts., 2.46 Imp.qts.)
- B7200 HST (4WD)..............

■ NOTE
- Remove the radiator cap (1) to drain cooling water completely.

Draining Transmission Oil

1. Remove the drain plug (1) to drain transmission oil.

(Capacity)
- B6200 HST (4WD).............. 12 l (13 U.S.qts., 10.6 Imp.qts.)
- B7200 HST (4WD)..............

(Lubricants)
- Manufacturer: Brand (Standard)
  - KUBOTA: UDT hydrostatic transmission fluid
  - SHELL: DONAX-TD, DONAX-TM
  - Mobil: Mobil Fluid 350
  - Exxon: Torque Fluid 56
Changing Front Axle Case Oil (B6200 HST 4WD) and Front Axle Arm Oil (B7200 HST 4WD)

1. Remove the drain plug (2) from the front axle case to drain oil. (B6200 HST 4WD)
2. Remove the drain plug (4) from the front axle arm to drain oil. (B7200 HST 4WD)

(Capacity)
Front axle case ............... 0.5 l (0.5 U.S.qts., (B6200 HST 4WD) 0.44 Imp.qts.)
Front axle arm ................ 1.5 l (1.6 U.S.qts., (B7200 HST 4WD) 1.32 Imp.qts.)

(Lubricants)
Gear oil SAE 80 or SAE 90

■ NOTE
• Remove the filling port plug (1) or (3) to drain oil completely.

Changing Gear Case Oil (B6200 HST 4WD) and Front Axle Case Oil (B7200 HST 4WD)

1. Remove the drain plug (2) from the gear case to drain oil. (B6200 HST 4WD)
2. Remove the drain plug (4) from the front axle case to drain oil. (B7200 HST 4WD)

(Capacity)
Gear case ......................... 0.15 l (0.16 U.S.qts., (B6200 HST 4WD) 0.13 Imp.qts.)
Front axle case ............... 0.5 l (0.5 U.S.qts., (B7200 HST 4WD) 0.44 Imp.qts.)

(Lubricants)
Gear oil SAE 80 or SAE 90

■ NOTE
• Remove the filling port plug (1) or (3) to drain oil completely.
[2] SEPARATING FRONT AXLE ASSEMBLY

Battery
1. Remove the battery cords (1).
2. Remove the battery retainer (2), and remove the battery.

NOTE
- When disconnecting the battery cords, disconnect the grounding cord first. When connecting, connect the positive cord first.

Hood and Skirts
1. Remove the front skirt (3).
2. Remove the right and left skirts (2), (5) with the auxiliary skirt.
3. Remove the clevis pin (4), and remove the hood (1).

Water Pipes, Inlet Pipe, Suction Pipe 2 and Muffler
1. Loosen the clamps and disconnect water pipe 1 (5), water pipe 4 (2) and the drain pipe (6).
2. Loosen the clamps and then disconnect the inlet pipe (3).
3. Loosen the clamps and disconnect suction pipe 2 (4) from oil cooler.
4. Remove the muffler (1).
Pipe 3 (4WD) and Return Pipe 2
1. Loosen the clamps and slide pipe 3 (1) backward.
2. Disconnect the return pipe 2 (2) at the joint (3).

Drag Link
1. Steer the front wheels to the left.
2. Remove the slotted nut connecting the knuckle arm (3) and drag link (2), and disconnect the drag link at the front end with a tie rod end lifter (1) (Code No: 07909-39021).

■ IMPORTANT
- After tightening the slotted nut to the specified torque, install the split pin as shown in the figure.

(Tightening torque)
Slotted nut: 17.7 to 34.3 N-m
1.8 to 3.5 kgf-m
13.0 to 25.3 ft-lbs

Separating Front Axle Assembly
1. Remove the front axle frame mounting screws and separate the front axle assembly from the engine.

(When reassembling)
- Correctly align the drive shaft and universal joint spline (4WD type only).

(Tightening torque)
Front axle frame: 39.2 to 64.7 N-m
mounting screw: 4.0 to 6.6 kgf-m
28.9 to 47.7 ft-lbs
Starter and Wiring
1. Disconnect the wiring for the dynamo (1).
2. Disconnect the wiring for the oil switch (2).
3. Disconnect the wiring for the starter (3), and remove the starter from the engine.

Rod, Wires, Cable and Wiring
1. Remove the accelerator control rod (3) from the speed change lever.
2. Disconnect the engine stop wire (4) from the stop lever.
3. Remove the decompression wire (1) from the decompression lever.
4. Disconnect the hourmeter cable (5).
5. Disconnect the wiring (2) for the glow plug.

Fuel Pipe
1. Close the filter cock.
2. Disconnect the fuel pipe (3) between the fuel pump (4) and the fuel filter (2) at the fuel filter side.
3. Remove the filter mounting screws (1), and remove the fuel filter from the engine.
Suction Pipe 1, Delivery Pipe and Shutter Plate
1. Disconnect the suction pipe 1 (2) from the hydraulic pump (3).
2. Remove the delivery pipe joint nut (4).
3. Remove the shutter plate (1).

Separating Engine
1. Remove the mounting screws, and separate the engine from the clutch housing.

(When reassembling)
- Be sure to replace the gasket on the clutch housing with a new one.

(Tightening torque)
- Engine mounting.............. 23.5 to 27.5 N-m
- screw.......................... 2.4 to 2.8 kgf-m
- .................................. 17.4 to 20.2 ft-lbs

Steering Wheel
1. Remove the steering wheel cap.
2. Remove the steering wheel mounting nut, and remove the wheel with a steering wheel puller (1) (Code No: 07916-51090).

(Tightening torque)
- Steering wheel................. 41.2 to 58.8 N-m
- mounting nut.................... 4.2 to 6.0 kgf-m
- .................................. 30.4 to 43.4 ft-lbs
**Meter Panel and Fuel Tank**

1. Disconnect the wire harness and the wiring for
   the fuel unit (3).
2. Remove the meter panel mounting screws (1), and
   remove the meter panel (2).
3. Remove the fuel tank band mounting screws (4)
   and remove the fuel tank (5).
4. Remove the fuel tank support.

**Meter Panel Holder**

1. Remove the cotter pin (2) and screws (1), and
   remove the cover (3).
2. Remove the cotter pin (5) and the rod.
3. Remove the screw (4) and the cotter pin (7), and
   remove the rod.
4. Remove the meter panel holder screws (8) and
   remove the meter panel holder (6).
Steering Assembly
1. Remove the slotted nut, and disconnect the drag link with a tie rod end lifter.
2. Remove the steering gear box mounting nuts, (2) and remove the steering assembly (1) from the clutch housing.

(Tightening torque)
Steering gear box............. 39.2 to 64.7 N-m
mounting nut
4.0 to 6.6 kgf-m
28.9 to 47.7 ft-lbs
Slotted nut..................... 17.7 to 34.3 N-m
1.8 to 3.5 kgf-m
13.0 to 25.3 ft-lbs

Seat, Tires, Fenders and Covers
1. Remove the seat (1).
2. Remove the left and right tires.
3. Remove the wiring (5).
4. Remove the left and right covers (3), (2).
5. Remove the right fender (4), and remove the left fender with battery bracket (6).

(Tightening torque)
Rear wheel hub................. 166.7 to 191.2 N-m
cotter 2 and nut
17.0 to 19.5 kgf-m
123.0 to 141.0 ft-lbs

Steps
1. Remove the left and right steps (1), (2).
Inlet Pipe, Delivery Pipe, Oil Filter and Rods
1. Remove the pipe clamp (6), and remove the inlet pipe (4) and delivery pipe (5).
2. Remove the oil filter (1).
3. Remove the left and right brake rods (3).
4. Remove the differential lock rod (2).
5. Remove the cotter pin (7), and remove the rod (8).

(When reassembling)
- Use care not to damage the O-rings on the inlet pipe.
- If loosen the turnbackle during disassembly, adjust the length of brake rod.
(See page S.G-13)

Filter Joint, Eye Joint Bolt and Spring Tension Adjusting Bolt
1. Remove the filter joint (1), the eye joint bolt (2) and the hydraulic pipe.
2. Remove the lock nut (4), nut (5) and remove the spring and spring tension adjusting bolt (3).

Hydraulic Pipe and Connecting Plate
1. Loosen the hose clamp (3) and remove the hydraulic pipe (2).
2. Remove the connecting plate (1).
[5] SEPARATING HYDROSTATIC TRANSMISSION

1. Remove the propeller shaft (4) from the 1st shaft (3).
2. Remove the drive shaft (5) from the front wheel drive shaft (2). (4WD type only)
3. Remove the HST mounting screws, and remove the HST (1).

(When reassembling)
- After inserting the spring pin to the 1st shaft and drive shaft, lock the spring pin with a wire.

(Tightening torque)
HST mounting screw .......... 48 to 56 N-m
                        .......... 4.9 to 5.7 kgf-m
                        .......... 35.4 to 41.2 ft-lbs

[6] SEPARATING HYDRAULIC CYLINDER

1. Remove the control valve (3) with the feedback rod (2). (B6200-B7200 HST 4WD type)
2. Remove the control valve with the check rod. (2WD type)
3. Remove the top link bracket (3).

(When reassembling)
- Use care not to damage the O-rings on the control valve.

(Tightening torque)
Control valve mounting screw (B6200-B7200 HST 4WD type). 16.7 to 21.6 N-m
                                             1.7 to 2.2 kgf-m
                                             12.3 to 15.9 ft-lbs
(2WD type)........................................... 16.7 to 21.6 N-m
                                             1.7 to 2.2 kgf-m
                                             12.3 to 15.9 ft-lbs
Top link bracket.......................... 39.2 to 46.7 N-m
                             mounting screw 4.0 to 6.6 kgf-m
                                      28.9 to 47.7 ft-lbs
**Hydraulic Cylinder**
1. Remove the hydraulic cylinder mounting screws, and separate the hydraulic cylinder.

**(When reassembling)**
- Be sure to replace the gasket with a new one.

**(Tightening torque)**
- Hydraulic cylinder: 20.6 to 29.4 N-m
- Mounting screw: 2.1 to 3.0 kgf-m
- 15.2 to 21.7 ft-lbs

---

**[7] SEPARATING TRANSMISSION CASE**

---

**(Front Case Cover)**
1. Set the main speed change lever in neutral position, and remove the front case cover (1).

**(When reassembling)**
- Apply liquid gasket (Three Bond 1102 or equivalent) to both sides of new gasket.

---

**(Separating Transmission Case)**
1. Remove the bolt (1).
2. Remove the fork shaft lock screw (2).
3. Remove the transmission case mounting nuts, and separate the transmission case.

**(When reassembling)**
- Apply liquid gasket (Three Bond 1102 or equivalent) to both sides of new gasket.

**(Tightening torque)**
- Transmission case: 39.2 to 64.7 N-m
- Mounting nut: 4.0 to 6.6 kgf-m
- 28.9 to 47.7 ft-lbs
Separating Rear Axle Case

1. Remove the rear axle case mounting screws, and separate the rear axle case.

(When reassembling)
- Be sure to replace the gasket with a new one.

(Tightening torque)
- Rear axle case mounting screw
  - M 10: 39.2 to 64.7 N-m
  - 4.0 to 6.6 kgf-m
  - 28.9 to 47.7 ft-lbs
  - M 12: 60.8 to 106.9 N-m
  - 6.2 to 10.9 kgf-m
  - 44.8 to 78.8 ft-lbs

TROUBLESHOOTING (Continued)

Tractor will not stop in neutral position.

Check linkage (speed control pedal to neutral holder and speed set device.)

- good: Adjust neutral adjuster
- can't adjust: Inspect neutral valve
  - defective: Repair

Tractor jerks when traveling slowly.

System operates in one direction only.

Check linkage (speed control pedal to neutral holder)

- good: Check high relief pressure
- defective: Repair or replace
  - unusually low: Repair check valve

DISASSEMBLY AND SERVICING

[1] SPEED SET DEVICE

DISASSEMBLY AND ASSEMBLY

Speed Set Lever
1. Measure the force to move the speed set lever in the direction (A) at its top (grip).
2. If the force is not within the factory specification, turn the nut (1) to adjust.

Force to move the lever
Factory specification: 29.4 to 34.3 N
3.0 to 3.5 kgf
6.6 to 7.7 lbs

(When reassembling)
- After installing the spring (3), align the head of nut (2) with the punched mark (4).

(1) Nut
(2) Nut
(3) Spring
(4) Punched Mark
[2] HYDROSTATIC TRANSMISSION (HST)

CHECKING AND ADJUSTMENT

Reverse Speed
1. Lift the rear of the tractor so that the rear wheels are off the ground.
2. Set the engine speed at 2500 rpm and depress the differential lock pedal.
3. If the rear wheels do not turn within the factory specifications, loosen the lock nut (1) and adjust the bolt (2).

Rear wheel rpm
Factory specification........ 64 to 68 rpm
(Engine 2500 rpm)

CAUTION
- Lift the tractor preventing it from dropping out of jacks.
- Shift the front wheel drive shaft lever to neutral position.

Neutral
1. Lift the rear of the tractor so that the rear wheels are off the ground and run the engine at low idling and drive only rear wheels.
2. Depress the one end of speed control pedal and release, and do the same at the other end.
3. If the rear wheels do not stop turning, adjust as following procedure.

NOTE
- Loosen the screw and be sure to place the neutral adjuster with its longer groove upward.

Adjusting Neutral
1. Rotate the neutral adjuster counterclockwise so that the rear wheels turn forward.
2. Then rotate it clockwise until wheels stop completely.
3. Put a mark on the clutch housing aligning the groove on neutral adjuster.
4. Rotate the neutral adjuster clockwise so that the rear wheels turn reverse.
5. Then rotate it counterclockwise until wheels stop completely.
6. Put a mark on the clutch housing aligning the groove on neutral adjuster.
7. Hold the neutral adjuster so that its groove is at the middle of the marks and tighten the screw.

NOTE
- When the wheels tend to turn forward, rotate the neutral adjuster clockwise.
- When the wheels tend to turn reverse, rotate the neutral adjuster counterclockwise.

(Tightening torque)
Neutral adjuster to case..... 19 to 32 N-m
1.9 to 3.3 kgf-m
13 to 24 ft-lbs
Oil pressure in Hydrostatic Transmission
1. Clean and clear the work area, and fully engage the parking brake.
2. Remove the knob screws (2) and sub cover (1).
3. Measure the following oil pressures using Hydrostatic Transmission Testing Kit (Code No.07916-52040) as instructed.
(1) High Relief Pressure
1. Remove the M 10 hex socket head plug from P1 (6) or P2 (5) port (P1 is for forward and P2 is for reverse).
2. Install connector 2 (4) to P1 (forward) or P2 (reverse) port.
3. Assemble connector 1 (2) and threaded joint (3) with the gasket between them.
4. Install the assembled connector 1 (2) and threaded joint (3) to connector 2 (4).
5. Install the cable (1), threaded joint in relief valve set pressure tester and high pressure gauge to threaded joint (3) in order.
6. Run the engine at 2600 to 2700 rpm.
7. Place the high-low shift lever in high.
8. Depress the speed control pedal approx. 10 mm (0.39 in.) which rotates the trunnion shaft 0.087 rad (5.0°).

■ IMPORTANT
- Measure quickly so that the relief valve may not be in operation more than 10 seconds.

■ NOTE
- High pressure gauge is 30 MPa (300 kgf/cm², 4260 psi) full scale.

(When reassembling)
- Install the M 10 plug to the port with the gasket laying on its seat.

High Relief Pressure (Oil temperature at 25° to 30°C, 77° to 122°F)
Factory specification......... 22.6 to 24.5 MPa
230 to 250 kgf/cm²
3271 to 3555 psi
Allowable limit............... 21.6 or 25.5 MPa
220 or 260 kgf/cm²
3128 or 3697 psi

(Tightening torque)
Plug (P1, P2 port).............. 20 to 25 N-m
2.0 to 2.5 kgf-m
14 to 18 ft-lbs
Plug seat (P1, P2 port)....... 55 to 59 N-m
5.6 to 6.0 kgf-m
41 to 43 ft-lbs
(2) Case and Case Relief Pressure
1. Remove the PT 1/4 plug from P3 port (4), with care not to allow any particle of sealing tape to enter into the port.
2. Install the long connector (3) to P3 port with sealing tape on its thread.
3. Install the threaded joint (2) to long connector with the gasket between them.
4. Install the cable (1), threaded joint in relief valve set pressure tester and low pressure gauge to threaded joint in order.
5. Run the engine at 2600 to 2700 rpm.
6. Place the high-low shift lever in neutral.
7. Release the speed control pedal to set in neutral.
8. After measuring the case pressure, remove the eye joint from T1 port and plug the port with PF 3/8 screw to measure the case relief pressure.

■ NOTE
- Low pressure gauge is 2 MPa (20 kgf/cm², 284 psi) full scale.

(When reassembling)
- Install the PT 1/4 plug to the P3 port with the sealing tape on its thread.

Case Relief Pressure (Oil temperature at 25° to 50°C, 77° to 122°F)
Factory specification........... 166 to 226 kPa
1.7 to 2.3 kgf/cm²
24.2 to 32.7 psi
Allowable limit.................. 147 or 245 kPa
1.5 or 2.5 kgf/cm²
21.3 or 35.6 psi

(Tightening torque)
Plug (P3 port)................... 8.8 to 10.8 N-m
0.9 to 1.1 kgf-m
6.5 to 7.9 ft-lbs
3) Charge Pressure
1. Remove the PT 1/4 plug from P3 port (4), with care not to allow any particle of sealing tape enter into the port.
2. Install the long connector (3) to P3 port with sealing tape on its thread.
3. Install the threaded joint (2) to long connector with the gasket between them.
4. Install the cable (1) and threaded joint in order.
5. Run the engine at 2800 to 3000 rpm.
6. Place the high-low shift lever in neutral.
7. Release the speed control pedal to set in neutral.

■ NOTE
- Low pressure gauge is 2 MPa (20 kgf/cm², 284 psi) full scale.

(When reassembling)
- Install the PT 1/4 plug to the P3 port with the sealing tape on its thread.

Charge Pressure (Oil temperature at 25°C, 77°F)
Factory specification...... 441 to 579 kPa
4.5 to 5.9 kgf/cm²
64.2 to 83.9 psi
Allowable limit................ 412 or 608 kPa
4.2 or 6.2 kgf/cm²
59.7 or 88.2 psi

Charge Pressure (Oil temperature at 30°C, 86°F)
Factory specification...... 421 to 559 kPa
4.3 to 5.7 kgf/cm²
61.1 to 81.1 psi
more than case pressure
Allowable limit................ 392 or 558 kPa
4.0 or 6.0 kgf/cm²
56.9 or 65.3 psi
more than case pressure

(Tightening torque)
Plug (P3 port)................ 8.8 to 10.8 N-m
0.9 to 1.1 kgf-m
6.5 to 7.9 ft-lbs
(4) Vacuum
1. Remove the PT 1/4 plug from P4 port (1) with care not to allow any particle of sealing tape enter into the port.
2. Install the long connector (2) to P4 port with sealing tape on its thread.
3. Install the threaded joint (3) to long connector with the gasket between them.
4. Install the cable (4), threaded joint in relief valve set pressure tester and vacuum gauge to threaded joint (3) in order.
5. Run the engine at 2800 to 3000 rpm.
6. Place the high-low shift lever in neutral.
7. Release the speed control pedal to set in neutral.

**NOTE**
- Vacuum gauge is 760 mmHg (30 in.Hg) full scale.

(When reassembling)
- Install the PT 1/4 plug to the P4 port with the sealing tape on its thread.

Vacuum (Oil temperature)
Factory specification ........ 120 mmHg
(at 25°C, 77°F)
60 mmHg
(at 50°C, 122°F)
35 mmHg
(at 80°C, 176°F)

Allowable limit .............. 220 mmHg
(at 80°C, 176°F)

(Tightening torque)
Plug (P3 port) ................. 8.8 to 10.8 N-m
0.9 to 1.1 kgf-m
6.5 to 7.9 ft-lbs

DISASSEMBLY AND ASSEMBLY

Hydrostatic Transmission (HST)
1. Remove the propeller shaft (4) from the 1st shaft (3).
2. Remove the drive shaft (6) from the front wheel drive shaft (2). (4WD type only)
3. Loosen the hose clamp and remove the hose (5).
4. Remove the HST mounting screws, and remove the HST (1).

(When reassembling)
- After inserting the spring pin into the 1st shaft and drive shaft, lock the spring pin with a wire.
- Be sure to replace the gasket with a new one.

(Tightening torque)
- HST mounting screw ........ 48 to 56 N-m
  4.9 to 5.7 kgf-m
35.4 to 41.2 ft-lbs
Neutral Holder
1. Place parting marks on the neutral adjuster (3) and the neutral holder arm (4).
2. Remove the screws and spring holder (5).
3. Remove the screw and the neutral holder arm (4).
4. Remove the screw (1) and pull out the neutral holder (2).

(When reassembling)
- Aligning the parting marks, install the neutral adjuster and the neutral holder arm.

(Tightening torque)
- Screw (1).......................... 19 to 32 N-m
- (neutral adjuster to case) 1.9 to 3.3 kg-m
- 14 to 24 ft-lbs

Front Wheel Drive Shaft 1 and Gears
1. Pull out the front wheel drive shaft 1 (3) forward.
2. Remove the external circlip and 13T gear (2).
3. Remove the external circlip and 16T gear (4).
4. Remove the hose joint (1) and gasket (5).

(When reassembling)
- Install the circlip with its rounded edge facing the gear or bearing so that its sharp edge in the groove keeps itself in place against the force.
Repair-stand for assembly and disassembly
To facilitate disassembly and assembly, make a repair stand as shown in the figure.

- **IMPORTANT**
  - Clean the repair-stand and the outside of the hydrostatic transmission case.
  - Hydrostatic transmission is composed of many precision parts and they have highly finished or polished surface.
  - Take extreme care to prevent damage or dirt during disassembly and assembly.
  - Coat hands with hydrostatic transmission oil before handling the parts to minimize the possibility of rust.
  - Clean the parts and coat them with hydrostatic transmission oil before assembling.

Port Block
1. Remove the port block mounting screws, and tap the front of port block (1) flange with a soft hammer to separate.

(When reassembling)
- Cover the splines of each shaft with thin tape to protect the sealing lip.
- Install port block with gasket, O-ring and valve plate in place.

- **IMPORTANT**
  - Valve plates (2), (3) may stick to the port block, but they are not fixed. Take care not to drop them.
  - Valve plates are not inter changeable. Valve plate of the pump has two notches and the valve of the motor has no notches.

(Tightening torque)
Port block to case........... 23 to 27 N-m
2.3 to 2.8 kgf-m
17 to 20 ft-lbs
**Motor Cylinder Block**

1. Hold the output shaft (1) and slightly tap the rear of case flange with a soft hammer to separate the motor cylinder block assembly.
2. Slide out the motor cylinder block (2) with pistons (3), retainer plate (4) and retainer holder (5).

**When reassembling**
- Aligning the hole on the swashplate to the dowel pin in the case, and install the output shaft assembly in the case.
**Pump Cylinder Block**

1. Remove the internal circlip retaining the retainer plate of pump.
2. Slide out pump cylinder block (1) with pistons (3) retainer plate (2) and internal circlip (4).
3. Draw out the thrust plate from the variable swashplate.

**(When reassembling)**

- Check that internal circlip (4) faces correct in the direction, and install it to pump swashplate.
- Squeeze the circlip (4) and slip into the hole its arc first by pushing down with a screwdriver to fit surely.
Charge Pump and Input Shaft
1. Remove the screws retaining the charge pump case (1).
2. Tapping the rear end of the input shaft (2) with a soft hammer, separate the charge pump case (1) with the input shaft (2) from the case.
3. Remove two knock pins.

Tightening torque
- Screw: 11 to 14 N-m
- (Charge pump case to case): 1.1 to 1.4 kgf-m
  - 8.0 to 10.1 ft-lbs

Pump Swashplate
1. Remove the screws retaining trunnion shaft cover.
2. Tap the end of trunnion shaft (1) with a soft hammer to separate the trunnion shaft cover 2 (3).
3. Tap the end of shaft with a soft hammer to separate the trunnion shaft cover 1 (2).

When reassembling
- Install the trunnion shaft covers (2), (3) with the seam of bearing (4), (5) facing forward (machined surface side of case).

Tightening torque
- Screw: 2.0 to 2.5 N-m
- (Trunnion shaft cover to case): 0.20 to 0.26 kgf-m
  - 1.4 to 1.9 ft-lbs
SERVICING

**Input Shaft**
1. Pull out the input shaft (3) with the bearing on it from the charge pump case.
2. Check the seal surface (1), the bearing surface (2) and the bearing (4).
3. If the shaft is rough or grooved, replace.
4. If the bearing is worn, replace.

**Cylinder Block Bore and Pistons**
1. Lift all the pistons gently with the retainer plate (1).
2. Check the pistons for their free movement in the cylinder block bores.
3. If the piston or the cylinder block bore is scored, replace the cylinder block assembly.

**IMPORTANT**
- Do not interchange pistons between pump and motor cylinder block. Pistons and cylinder blocks are matched.

Clearance between piston and bore

Factory specification........... 0.02 mm
0.0008 in.

**Piston Slipper and Retainer Plate**
1. Check the slipper (1) for flatness.
2. If rounded, replace.
3. Measure the thickness of piston slipper.
4. If the measurement is less than the allowable limit, replace.
5. Check the lubricant hole (2) for clogging.
6. If clogged, open hole with compressed air.

Thickness of slipper

Factory specification........... 3.00 mm
0.118 in.

Allowable limit................... 2.90 mm
0.114 in.

**Cylinder Block Face**
1. Check the polished face (1) of cylinder block for scoring.
2. If scored, replace the cylinder block assembly.
3. Check the spring (2) for breakage.
4. If broken, replace the cylinder block assembly.
Valve Plate
1. Check the engagement of the valve plate (1) and the anchor pin (2).
2. Pushing the valve plate against the anchor pin, lift it to remove.
3. Check the valve plate for foreign particles.
4. Clean the valve plate and dry with compressed air.
5. Check the valve plate for scratches, wear and erosion.
6. If worn or scored, replace.

- **NOTE**
  - Run a finger nail across the valve plate surface. If worn, it will be felt.
  - After checking, coat them with hydrostatic transmission oil.

Swashplate and Thrust Plate
1. Check the bearing surface of trunnion shaft (1) for scratches and excessive wear.
2. If worn or scored, replace.
3. Check the thrust plate (2) for scratches and excessive wear.
4. If worn or scored, replace.

Trunnion Shaft Cover
1. Check the bearings (1) for scratches and excessive wear.
2. If worn or scored, replace.
3. Check the oil seal (2) and the O-ring (3) for damage.

- **NOTE**
  - After checking, coat the bearing with hydrostatic transmission oil, and the oil seal lip and the O-ring with grease.
  - When replace the oil seal (2), press it in the trunnion shaft cover until it is 1 mm (0.039 in.) below the shoulder and obtain the clearance under it.
Oil Seal and Bearing

1. Remove the flanges (3), (6) and check the oil seals (1), (4) for damage.
2. Check the bearings (2), (5) for wear.
3. If the bearings are worn, replace.

**NOTE**
- After checking, coat the bearing with hydrostatic transmission oil and the oil seal lip with grease.
- When replacing the bearing, press it in the port block so that its mark faces outside and 3.5 mm (0.138 in.) of it remains above the machined surface.
- When reassembling, always replace the oil seal as follows.
- Press the oil seal (4) in the port block until it is 3 mm (0.118 in.) below the machined surface using the flange 1 (6).
- Press the oil seal (1) in the port block until so that 0.5 mm (0.020 in.) of it remains above the machined surface using the flange 2 (3).
**Case Relief Valve**
1. Check the valve and the spring for excessive wear and breakage.
2. If worn or broken, replace.

**NOTE**
- The screw and the nut should be tightened fully, and then 3 to 3.5 mm (0.118 to 0.138 in.) of the thread on the screw will extend from the nut.

**Length of valve spring**
- Factory specification: 25.95 mm
  - (free): 1.022 in.
  - (load 29.4 N, 3.00 kgf, 6.62 lbs): 20.0 mm
  - (load 41.8 N, 4.26 kgf, 9.39 lbs): 0.787 in.
  - (load 76.5 N, 78.0 kgf, 172 lbs): 17.5 mm
  - (load 104.7 N, 4.26 kgf, 9.39 lbs): 0.689 in.

**(Tightening torque)**
- Screw and nut: 1.7 to 2.3 N-m
  - 0.17 to 0.23 kgf-m
  - 1.2 to 1.7 ft-lbs

**High Pressure Relief Valve**
1. Remove the cap nut (1).
2. Put an alignment mark across the seat screw (2) and the port block (10) and measure its height from the port block to get the same setting pressure when reassembling.
3. Remove the valve seat (4) using the valve seat driver, which is shown in figure.
4. Check the poppet valve (5) for scratches and damage.
5. Check the valve seat (4) in the port block for damage.
6. Check the O-rings (7), (9) and the backup rings (6), (8) for damage.
7. Check the spring (3) for breakage and wear.
8. If anything unusual, replace the high pressure relief valve complete assembly.

**NOTE**
- When reassembling, replace the O-ring and bonded seal.
- When the setting height of the seat screw (2) is not known, tighten it temporarily and adjust after reassembling the tractor.
- After reassembling the tractor, check the setting pressure and adjust by turning the set screw (2).

**Length of valve spring**
- Factory specification: 40.00 mm
  - (free): 1.575 in.
  - (load 61.2 N, 62.4 kgf, 138 lbs): 34.0 mm
  - (load 76.5 N, 78.0 kgf, 172 lbs): 1.339 in.
  - (load 104.7 N, 4.26 kgf, 9.39 lbs): 32.5 mm
  - (load 130.7 N, 4.26 kgf, 9.39 lbs): 1.280 in.

**(Tightening torque)**
- Cap Nut: 59 to 69 N-m
  - 6.0 to 7.0 kgf-m
  - 43 to 51 ft-lbs
- Valve Seat: 24 to 29 N-m
  - 2.4 to 3.0 kgf-m
  - 17 to 22 ft-lbs
"Valve-seat Driver"

Material: 543-CD
Heat Treatment: Quenching and Tempering
Hardness: HRC-44
Parts number: 07916-60841

Dimensions:
- 16.75 to 17.00 mm (0.659 to 0.669 in.)
- 160 mm (6.3 in.)
- 144 mm (5.7 in.)
- 14 mm (0.55 in.)
- 4 mm (0.16 in.)
- 2.9 to 3.0 mm (0.114 to 0.118 in.)
- Ø 15.3 to 15.5 mm (0.602 to 0.610 in.)
- Ø 16.8 to 17.0 mm (0.661 to 0.669 in.)
Neutral and Check Valves
1. Remove the valve assembly and disassemble it.
2. Check the check valve (1) and the neutral valve (5) for their free movement on or in the valve body (4).
3. If the valve surface is scored, replace.
4. Check the holes of the valve body (4) and the neutral valve (5) for clogging.
5. If clogged, open hole with compressed air.
6. Check the O-rings (2), (6) and the backup ring (3) for scratches and damage.
7. Check the springs for breakage and wear.
8. If anything unusual, replace.

NOTE
- When reassembling, replace the O-rings and the backup rings.

Length of valve spring (1) (neutral valve)
Factory specification........ 19.71 mm
(free) 0.7760 in.
(load 27 N, 15 mm 2.7 kgf, 6.0 lbs) 0.591 in.
(load 49.0 N, 11 mm 5.0 kgf, 11.0 lbs) 0.43 in.

Length of valve spring (2) (neutral valve)
Factory specification........ 29.7 mm
(free) 1.1691 in.
(load 17 N, 15 mm 1.7 kgf, 3.7 lbs) 0.591 in.
(load 21.18 N, 11 mm 2.16 kgf, 4.76 lbs) 0.43 in.

Length of valve spring (check valve)
Factory specification........ 26.91 mm
(free) 1.0594 in.
(load 3.128 N, 19.5 mm 0.319 kgf, 0.703 lbs) 0.768 in.
(load 4.511 N, 16.2 mm 0.460 kgf, 1.014 lbs) 0.638 in.

(Tightening torque)
Valve body to case............ 34 to 39 N-m
3.5 to 4.0 kgf-m
25 to 29 ft-lbs

Charge Relief Valve
1. Remove the internal circlip (5) and draw out the spring holder (4).
2. Check the spring (3) for breakage and wear.
3. Check the O-ring (1), (2) for damage.
4. If anything unusual, replace.

NOTE
- Install the internal circlip with its sharp edge facing outside.
 Charge Pump
1. Check the charge pump case (1), the plate (2) and the gerotor set (3) for scratches and wear.
2. If scratched or worn, replace the charge pump complete assembly.
3. Measure the side clearance referring to the figure.
4. If the clearance exceeds the factory specification, replace the charge pump complete assembly.

**NOTE**
- When reassembling, replace the O-rings and the oil seals, and grind the surface of the plate (2) and the charge pump case (1) with finest oil stone.

Side clearance
Factory specification........ 0.030 to 0.060 mm
0.00118 to 0.0236 in.

Special Tool A for Pressing Oil Seal
1. Make the special tools shown in figure and reassemble the charge pump according to following directions.
Reassembling (1)
1. Press the swashplate in neutral and install the input shaft (5) to the case (1) with the bearing (2) on it.
2. Install the collar (7) on the bearing (2).
3. Coat the O-rings (8), (10) with hydrostatic transmission oil and install them on the case (1).
4. Install the dowel pins (3), (9) and the plate (4).
5. Grind the key (6) with fine oil stone and install in the groove of the input shaft (3).
6. Install the gerotor set (11), noting the location of groove for the key.

Reassembling (2)
1. Coat the O-rings (5), (6) with hydrostatic transmission oil and install them on the charge pump case (4).
2. Install the charge pump case (4) on the plate (10) and the gerotor set (9), and screw the screws (7) lightly.
3. Press the plate (3) in the charge pump case (4).
4. Cover the splines and the shoulder of the input shaft (8) with thin tape.
5. Press the oil seal (2) in the charge pump case using the special tool (A), until it is 4 mm (0.157 in.) below the machined surface.
6. Install the internal circlip (1) with its sharp edge facing outside.
7. Tighten the screws (7).

(Tightening torque)
Charge pump case to case..11 to 14 N-m
1.1 to 1.4 kgf-m
8.0 to 10.1 ft-lbs
DISASSEMBLY AND ASSEMBLY

Fork Shaft and Shift Fork
1. Remove the fork shaft lock screw (1).
2. Screw M8 screw (pitch 1.25 x 70 mm long, pitch 1.25 x 2.76 in. long) into the fork shaft (3), and tap out it to the rear.
3. Remove the shift fork (2).

(When reassembling)
- Install the fork shaft with the groove (4) facing the differential gear case (5).

Spiral Bevel Pinion Shaft
1. Remove the one-way clutch drum (1).
2. Remove the spiral bevel pinion with gears and bearings on it.

4th Shaft
1. Remove the external circlip (1) and shift the external circlip (2) forward.
2. Tapping out the 4th shaft (3) rearward, remove the 24T gear (4).
3. Take out the 4th shaft with the gears and the bearings on it.
**Front Wheel Drive Shaft**
1. Remove the 24T gear (1).
2. Remove internal circlip (2).
3. Draw out the front wheel drive shaft (3).

**2nd Shaft and 29T-14T-18T Gear**
1. Remove the external circlip (1).
2. Remove the 14T gear (2).
3. Tap out the 2nd shaft (3) rearward.
4. Take out the 29T-14T-18T gear.
3rd Shaft and 21T-21T-17T Gear
1. Remove the internal circlip (1).
2. Tap out the 3rd shaft (2) rearward.
3. Take out the 21T-21T-17T gear.

Mid-PTO
1. Separate the mid-PTO case from the transmission case.
2. Remove the mid-PTO case cover (5).
3. Remove the screw (2) and pull out the mid-PTO counter shaft (3) and remove the 24T gear (1).
4. Draw out the 11T gear shaft (4) with the bearing on it.

(Tightening torque)
Screw (2).......................... 14 to 20 N·m
1.4 to 2.0 kgf·m
10 to 14 ft-lbs
Mid-PTO case cover............. 14 to 20 N·m
to case 1.4 to 2.0 kgf·m
10 to 14 ft-lbs
Mid-PTO case..................... 48 to 56 N·m
to transmission case 4.9 to 5.7 kgf·m
35 to 41 ft-lbs

NOTE
- Mid-PTO for B6200HSE (above S/N 11354), B7200HSE (above S/N 11636), B6200HSD (above S/N 52424) and B7200HSD (above S/N 56970) was modified as shown in the left figure.

Mid-PTO
1. Separate the mid-PTO case from the transmission case.
2. After tapping the spring pin (2) into the shaft (3), remove the shaft (3) and the 24T gear (1).
3. Remove the oil seal (6) and the external snap ring (5).
4. Draw out the 11T gear shaft (4) with the bearing on it.

(Tightening torque)
Plug.................................. 32.5 to 36.2 N·m
4.5 to 5.0 kgf·m
44 to 49 ft-lbs
Mid-PTO case..................... 48.0 to 55.9 N·m
to transmission case 4.9 to 5.7 kgf·m
35 to 41 ft-lbs
DISASSEMBLY AND ASSEMBLY

Differential Assembly
1. Remove the left and right differential bearing holders (19), (9).
2. Take out the differential assembly from the differential gear case.

(When reassembling)
- Install the differential assembly, noting the number of differential side shims (10), (18).

5th Shaft
1. Remove the external snap ring (1), and remove the drum (2) and spring (3).
2. Remove the rear cover mounting screws.
3. Remove the 5th shaft (5) with the PTO shaft.

(Tightening torque)
- Rear cover mounting......... 39.2 to 64.7 N·m
- Screw 4.0 to 6.6 kgf·m
  28.9 to 47.7 ft·lbs
PTO Shaft
1. Flatten the lock washer (5).
2. Remove the screw (6), plain washer, lock washer (5), washer (4) and straight pin.
3. Tap out the PTO shaft (7) to the rear.

(When reassembling)
- Replace the lock washer with a new one, and be sure to adjust the turning torque of PTO shaft.
  (See page S.2-10 in B5200-B6200-B7200 WSM)
- Lock the screw with the lock washer after adjusting the turning torque.

(Tightening torque)
Screw.......................... 18.6 to 32.4 N·m
.................................. 1.9 to 3.3 kgf·m
.................................. 13.7 to 23.9 ft·lbs

SERVICING
Checking Bearing
1. Hold the inner race, and push and pull the outer race in all directions to check for wear and roughness.
2. Apply transmission oil to the bearing, and hold the inner race. Then, turn the outer race to check rotation.
3. If there is any defect, replace.

Backlash between Gear and Spline
1. Secure the shaft in a vise.
2. Set a dial indicator (lever type).
3. Move the gear by hand for measurement.
4. If the measurement exceeds the allowable limit, replace it.

Backlash between gear and spline
Factory specification........... 0.03 to 0.08 mm
.................................. 0.002 to 0.003 in.
Allowable limit................. 0.20 mm
.................................. 0.008 in.

Gear Backlash
1. Set a dial indicator (lever type) with its finger on the tooth surface.
2. Move the gear to measure the backlash, while holding the mating gear.
3. If the measurement exceeds the allowable limit, replace.

Gear backlash
Factory specification........... 0.10 to 0.20 mm
.................................. 0.004 to 0.008 in.
Allowable limit............... 0.4 mm
.................................. 0.006 in.
Clearance between Shift Fork and Shift Gear Groove
1. Place the shift fork in the shift gear groove and measure the clearance with a feeler gage.
2. If the clearance exceeds the allowable limit, replace.

Clearance between shift fork and shift gear groove
Factory specification........ 0.10 to 0.30 mm
0.004 to 0.012 in.
Allowable limit.............. 0.5 mm
0.020 in.

Clearance between 29T-14T-18T Gear and 2nd Shaft
1. Measure the 29T-14T-18T gear I.D. with an inside micrometer, and then 2nd shaft O.D. with an outside micrometer.
2. Measure the O.D. of two needles in the needle bearing with an outside micrometer.
3. Clearance is the difference between the gear I.D. and the sum of shaft O.D. and two needle O.D.
4. If the clearance exceeds the allowable limit, replace.

Clearance between 29T-14T-18T gear and reverse shaft
Factory specification........ 0.007 to 0.053 mm
0.0003 to 0.0021 in.
Allowable limit.............. 0.1 mm
0.0039 in.

2nd shaft O.D.
Factory specification........ 21.987 to 22.000 mm
0.8656 to 0.8661 in.

29T-14T-18T gear I.D.
Factory specification........ 28.007 to 28.028 mm
1.1026 to 1.1035 in.

Needle O.D.
Factory specification........ 29.94 to 3.000 mm
0.1179 to 0.1181 in.

Clearance between 17T, 21T gear and 3rd shaft
Factory specification       0.007 to 0.047 mm
0.0003 to 0.00185 in.
Allowable limit.............. 0.1 mm
0.0039 in.

3rd shaft O.D.
Factory specification........ 24.987 to 25.000 mm
0.9837 to 0.9843 in.

21T, 17T gear I.D.
Factory specification........ 29.007 to 29.028 mm
1.1420 to 1.1428 in.

Needle O.D.
Factory specification........ 1.997 to 2.000 mm
0.0786 to 0.0787 in.
Initial Turning Torque of PTO Shaft

1. Tighten the screw (10) to the specified torque (18.6 to 32.4 N-m, 1.9 to 3.3 kgf-m, 13.7 to 23.9 ft-lbs).
2. Install the PTO shaft to the rear cover, and install it to the differential gear case.
3. Screw the screw (M10 x Pitch 1.25) in the PTO shaft (9), and set a torque wrench to it.
4. Turn the PTO shaft with a torque wrench to measure the initial turning torque.
5. If the initial turning torque is not within the factory specifications, adjust the shim (15).

Initial turning torque
Factory specification........0.49 to 1.47 N-m
0.03 to 0.15 kgf-m
0.36 to 1.08 ft-lbs

(Reference)
- Thickness of shim: 0.3 mm (0.012 in.)
  0.4 mm (0.016 in.)
  0.5 mm (0.020 in.)

■ NOTE
- Lock the screw (10) with the lock washer (12) after adjusting the turning torque.
Backlash between Ring Gear and Spiral Bevel Pinion Shaft

1. Set a dial indicator (lever type) on the ring gear.
2. Measure the backlash by fixing the spiral bevel pinion shaft and moving the ring gear by hand.
3. When the backlash is too small, decrease the number of shims (2) in the side of the ring gear, and insert the removed shims in the opposite side. When the backlash is too large, decrease the number of shims (1) in the side of the differential case, and insert the removed shims in the opposite side.
4. Adjust the backlash properly by repeating the above procedure.

Backlash between ring gear and spiral bevel pinion shaft

Factory specification........ 0.1 to 0.2 mm
                                             0.004 to 0.008 in.
Allowable limit...................... 0.4 mm
                                             0.016 in.

(Reference)

- Thickness of differential side shims (1): 0.2 mm (0.008 in.), 0.3 mm (0.012 in.), 0.5 mm (0.020 in.)
- Thickness of differential side shims (2): 0.2 mm (0.008 in.), 0.3 mm (0.012 in.), 0.5 mm (0.020 in.)
TO THE READER

In this section, the altered points of New HYDROSTATIC TRANSMISSION from the previous HST are explained separately in two items, "Mechanism" and "Servicing".

The serial number of tractors, new HST has been affected, is as follows.

<table>
<thead>
<tr>
<th>Model</th>
<th>Serial Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>B6200HST (2WD)</td>
<td>above 20001</td>
</tr>
<tr>
<td>B6200HST (4WD)</td>
<td>above 60001</td>

[1] HYDROSTATIC TRANSMISSION

(1) Structure

Hydrostatic transmission is composed of a variable displacement piston pump, fixed displacement piston motor, charge pump and valve system.
(1) Check and High Pressure Relief Valve (Forward)
(2) Pump Kidney Port A
(3) Motor Kidney Port C
(4) Output Shaft
(5) Neutral Valve (Forward)
(6) P1 Port
(7) P2 Port
(8) Charge Relief Valve
(9) Check and High Pressure Relief Valve (Reverse)
(10) Pump Kidney Port B
(11) Input Shaft
(12) Case Relief Valve
(13) Motor Kidney Port D
(14) Neutral Valve (Reverse)
(2) Pump and Motor

Pump and motor cylinder, each containing pistons, are connected by lines. Cylinders and lines are filled with oil. Pistons ride against swashplates located in pump and motor.

In the pump, as the cylinder rotates, pistons move across the sloping face of swashplate and slide in or out of their cylinder bores.

The oil, forced out by the pump pistons, causes the motor pistons to slide out of their cylinder bores. In the motor, sliding out of the cylinder and moving across the sloping face of swashplate, the pistons rotate the cylinder.

(3) Variable Swashplate

This pump is variable displacement one. The angle of its swashplate can be varied so that the volume and pressure of oil pumped by the pistons can be changed or the direction of oil flow can be reversed. The swashplate is moved around the trunnion shaft with the neutral holder, by stepping on the speed control pedal linked to the neutral holder.
(4) Oil Flow and Valves

The pump and motor are joined in a closed hydraulic loop and most of oil circulates within the main oil circuit. A little oil lubricates and oozes out from the clearance between the moving parts of the case. Then oil in the main oil circuit of the hydrostatic transmission needs to be supplied a want. So all of oil fed from the main hydraulic pump flows to the hydrostatic transmission for charging.

Only return oil from the hydraulic cylinder drops to the transmission case.

The charge oil aids smooth operation of piston pump and motor. The rest of the oil passes through the charge relief valve into the case. Then the oil passes to the main hydraulic pump through a cooler.

P1: Port for checking high pressure (forward)
P2: Port for checking high pressure (reverse)
P3: Port for checking case pressure
P4: Port for checking vacuum
P5: Port for checking case pressure
Charge Relief Valve

While pumped and filtered oil flows into the main oil circuit through the check valves, excessive oil passes to the case through the charge relief valve.

<table>
<thead>
<tr>
<th>Oil temperature</th>
<th>Valve operating pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>50 °C (122°F)</td>
<td>392 to 588 kPa (4.0 to 6.0 kgf/cm², 57 to 85 psi) more than case pressure</td>
</tr>
</tbody>
</table>

Neutral Valve

The neutral valves in the main oil circuit lines are open and pass the oil to the case when in neutral, and the oil pressure in their lines becomes low. And when the oil pressure in the high pressure line increases to a specified pressure, the neutral valve closes.

<table>
<thead>
<tr>
<th>Oil temperature</th>
<th>Valve operating pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>50 °C (122°F)</td>
<td>Close: 2.45 to 3.73 MPa (25 to 38 kgf/cm², 356 to 540 psi) Open: 1.47 MPa (15 kgf/cm², 213 psi)</td>
</tr>
</tbody>
</table>
### Check and High Pressure Relief Valve

The check and high pressure relief valves monitor the oil pressure in each line of the main oil circuit. In neutral, both valves are open and charging oil enters into the main oil circuit through the valves. At normal operation, the check valve in the high pressure side is closed and it pushes and opens the another one.

When excessively high pressure is built up in one line, the high pressure relief valve located in this line is open and the oil flows into another line.

### Case Relief Valve

The case relief valve monitors the oil pressure in the hydrostatic transmission case. When the oil pressure rises, it opens and flows the oil directly to the transmission case, so that the oil may not leak against the sealings.

</tr>
</tbody>
</table>
(5) Operation

■ Neutral

When the speed control pedal is in neutral, the variable swashplate is at right angles to the pump pistons and they only rotate with cylinder block without reciprocating. Since the oil is not being pumped to the motor, the cylinder block in the motor is stationary and the output shaft does not move.
When the speed control pedal is stepped on and in forward, the variable swashplate is tilted as shown in figure above.

As the pump cylinder block rotates with the input shaft, oil is forced out of pump kidney port A at high pressure. As pressure oil enters motor kidney port C, the pistons, which align with port C, are pushed against the swashplate and slide down the inclined surface.

Then the output shaft rotates with the motor cylinder block. This drives the machine forward and the angle of pump swashplate determines the output shaft speed.

As the motor cylinder block continues to rotate, oil is forced out of motor kidney port D at low pressure and returns to the pump.
When the speed control pedal is stepped on and in reverse, the variable swashplate is tilted as shown in figure above.

As the pump cylinder block rotates with the input shaft, oil is forced out of pump kidney port B at high pressure. As pressure oil enters motor kidney port D, the pistons, which align with port D, are pushed against the swashplate and slide down the inclined surface.

Then the output shaft rotates with the motor cylinder block. This drives the machine rearward and the angle of pump swashplate determines the output shaft speed.

As the motor cylinder block continues to rotate, oil is forced out of motor kidney port C at low pressure and returns to the pump.
(6) Control Linkage

The speed control pedal (6) and the trunnion shaft of variable swashplate are linked with the rod guide (3), the speed control rod (2) and the neutral holder (1). As the front footrest of the pedal is depressed, the swashplate rotates and forward traveling speed increases. Depressing the rear footrest increases reverse speed.

The roller (8) on the neutral holder arm (7) hanged with spring seats the detent of the neutral holder (1) so that the neutral holder returns to neutral.

Then, the swashplate is returned to neutral with the neutral holder, when the pedal is released. The damper (5) connected to the rod guide (3) restricts the movement of the linkage to prevent abrupt operation or reversing.

The speed set device (4) linked to the rod guide (3) enables the linkage not to return to neutral and to keep a certain forward speed while the speed control pedal (6) is released.

On B6200HST, this device is installed as optional.

CHECKING, DISASSEMBLING AND SERVICING

[1] SPEED SET DEVICE

DISASSEMBLING AND ASSEMBLING

**Speed Set Lever**

1. Measure the force to move the speed set lever A forward at its top (grip).
2. If the force is not within the factory specification, turn the nut (1) to adjust.

<table>
<thead>
<tr>
<th>Force to move the lever</th>

<td></td>
</tr>
</tbody>
</table>

(When reassembling)

- After installing the spring (3), align the head of nut (2) with the punched mark (4).

(1) Nut  
(2) Nut  
(3) Spring  
(4) Punched Mark
[2] HYDROSTATIC TRANSMISSION

CHECKING AND ADJUSTING

Reverse Speed

1. Lift the rear of the tractor so that the rear wheels are off the ground.
2. Set the engine speed at 2500 rpm and depress the differential lock pedal.
3. If the rear wheels do not turn within the factory specifications, loosen the lock nut (1) and adjust the bolt (2).

<table>
<thead>
<tr>
<th>Rear wheel rpm</th>
<th>Factory spec.</th>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(1) Lock Nut
(2) Bolt

Neutral

1. Lift the rear of the tractor so that the rear wheels are off the ground and run the engine at low idling and drive only rear wheels.
2. Depress the one end of speed control pedal and release, and do the same at the other end.
3. If the rear wheels do not stop turning, adjust as following procedure.

**NOTE**
- Loosen the screw and be sure to place the neutral adjuster with its longer groove upward.

Adjusting Neutral

1. Rotate the neutral adjuster counterclockwise so that the rear wheels turn forward.
2. Then rotate it clockwise until wheels stop completely.
3. Put a mark on the clutch housing aligning the groove on neutral adjuster.
4. Rotate the neutral adjuster clockwise so that the rear wheels turn reverse.
5. Then rotate it counterclockwise until wheels stop completely.
6. Put a mark on the clutch housing aligning the groove on neutral adjuster.
7. Hold the neutral adjuster so that its groove is at the middle of the marks and tighten the screw.

**NOTE**
- When the wheels tend to turn forward, rotate the neutral adjuster clockwise.
- When the wheels tend to turn reverse, rotate the neutral adjuster counterclockwise.

**DISASSEMBLING AND ASSEMBLING**

Hydrostatic Transmission
1. Remove the propeller shaft (4) from the 1st shaft (3).
2. Remove the drive shaft (6) from the front wheel drive shaft (2). (4WD type only)
3. Loosen the hole clamp and remove the hose (5).
4. Remove the HST mounting screws, and remove the HST (1).

**When reassembling**
- After inserting the spring pin into the 1st shaft and drive shaft, lock the spring pin with a wire.
- Be sure to replace the gasket with a new one.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>HST mounting screw</th>
</tr>
</thead>
<tbody>
<tr>
<td>48.1 to 55.9 N·m</td>
<td>4.9 to 5.7 kgf·m</td>
</tr>
</tbody>
</table>

Neutral Holder
1. Place parting marks on the neutral adjuster (3) and the neutral holder arm (4).
2. Remove the screws and spring holder (5).
3. Remove the screw and the neutral holder arm (4).
4. Remove the screw (1) and pull out the neutral holder (2).

**When reassembling**
- Aligning the parting marks, install the neutral adjuster and the neutral holder arm.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Neutral holder arm mounting screw</th>
</tr>
</thead>
<tbody>
<tr>
<td>18.6 to 22.4 N·m</td>
<td>1.9 to 3.3 kgf·m</td>
</tr>
</tbody>
</table>
Front Wheel Drive Shaft 1 and Gears
1. Pull out the front wheel drive shaft 1 (3) forward.
2. Remove the external snap ring and 13T gear (2).
3. Remove the external snap ring and 16T gear (4).
4. Remove the hose joint (1) and gasket (5).

(When reassembling)
- Install the snap ring with its rounded edge facing the gear or bearing so that its sharp edge in the groove keeps itself in place against the force.

---

Repair-stand for Assembling and Disassembling
1. To facilitate disassembling and assembling, make a repair stand as shown in the figure.

- **IMPORTANT**
  - Clean the repair-stand and the outside of the hydrostatic transmission case.
  - Hydrostatic transmission is composed of many precision parts and they have highly finished or polished surface.
  - Take extreme care to prevent damage or dirt during disassembling and assembling.
  - Coat hands with hydrostatic transmission oil before handling the parts to minimize the possibility of rust.
  - Clean the parts and coat them with hydrostatic transmission oil before assembling.
Port Block
1. Remove the port block mounting screws, and tap the front of port block (1) with a soft hammer to separate from the case.

(Whenreassembling)
- Cover the splines of each shaft with thin tape to protect the sealing lip.
- Install port block with gasket, O-ring and valve plate in place.

**IMPORTANT**
- Valve plates (2), (3) may stick to the port block, but they are not fixed. Take care not to drop them.
- Valve plates are not interchangeable. Valve plate of the pump has two notches and the valve of the motor has no notches.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Port block to case</th>
<th>(1) Port Block</th>
<th>(2) Pump Valve Plate</th>
<th>(3) Motor Valve Plate</th>
<th>(4) Needle Bearing</th>
</tr>
</thead>
<tbody>
<tr>
<td>48.1 to 55.9 N·m</td>
<td>4.9 to 5.7 kgf·m</td>
<td>35.4 to 41.2 ft·lbs</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Motor Cylinder Block**
1. Hold the output shaft (1) and slightly tap the rear of case flange with a soft hammer to separate the motor cylinder block assembly.
2. Slide out the motor cylinder block (2) with pistons (3), retainer plate (4) and retainer holder (5).

(Whenreassembling)
- Aligning the hole on the swashplate to the dowel pin in the case, and install the output shaft assembly in the case.

<table>
<thead>
<tr>
<th>(1) Output Shaft</th>
<th>(2) Motor Cylinder Block</th>
<th>(3) Piston</th>
<th>(4) Retainer Plate</th>
<th>(5) Retainer Holder</th>
</tr>
</thead>
</table>

**IMPORTANT**
- Valve plate of the pump (with two notches) should be mounted on the pump side of the port block.
- The notch side of pump valve plate should be directed to the side of the pump cylinder block.

<table>
<thead>
<tr>
<th>(1) Pump Valve Plate</th>
<th>(2) Motor Valve Plate</th>
<th>(3) Notch</th>
</tr>
</thead>
</table>
Pump Cylinder Block
1. Remove the internal snap ring retaining the retainer plate of pump.
2. Slide out pump cylinder block (1) with pistons (3) retainer plate (2) and internal snap ring (4).
3. Draw out the thrust plate from the variable swashplate.

(When reassembling)
- Check that internal snap ring (4) faces correct in the direction, and install it to pump swashplate.
- Squeeze the snap ring (4) and slip into the hole its arc first by pushing down with a screwdriver to fit surely.

(1) Pump Cylinder Block  (2) Retainer Plate  (3) Piston  (4) Snap Ring

Charge Pump and Input Shaft
1. Remove the screws (4) for retaining the charge pump case (1).
2. Tapping the rear end of the input shaft (2) with a soft hammer, separate the charge pump case (1) with the input shaft (2) from the case.
3. Remove two dowel pins (3).

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

(1) Charge Pump Case  (2) Input Shaft  (3) Dowel Pin  (4) Screw
Cover "A", "B" and Trunnion Shaft
1. Remove the internal snap ring.
2. Tap the trunnion shaft (1) using a soft hammer to create a clearance between the case and the cover "A" (2).
   Then, pry the cover "A" (2) open with a screw-driver. Pry the cover "B" (5) in the same way.
3. Pull out the trunnion shaft (1).

   (1) Trunnion Shaft
   (2) Cover "A"
   (3) Oil Seal
   (4) Seam of Bearing
   (5) Cover "B"

Input Shaft
1. Pull out input shaft (3) with the bearing on it from the charge pump case.
2. Check the seal surface (1), the bearing surface (2) and the bearing (4).
3. If the shaft is rough or grooved, replace.
4. If the bearing is worn, replace.

   (1) Seal Surface
   (2) Bearing Surface
   (3) Input Shaft
   (4) Bearing

Cylinder Block Bore and Pistons
1. Lift all the pistons gently with the retainer plate (1).
2. Check the pistons for their free movement in the cylinder block bores.
3. If the piston or the cylinder block bore is scored, replace the cylinder block assembly.

<table>
<thead>
<tr>
<th>Clearance between piston and bore</th>
<th>Factory spec.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.02 mm</td>
</tr>
<tr>
<td></td>
<td>0.0008 in.</td>
</tr>
</tbody>
</table>

(1) Retainer Plate
Piston Slipper and Retainer Plate
1. Check the slipper (1) for flatness.
2. If rounded, replace.
3. Measure the thickness of piston slipper.
4. If the measurement is less than the allowable limit, replace.
5. Check the lubricant hole (2) for clogging.
6. If clogged, open hole with compressed air.

<table>
<thead>
<tr>
<th>Thickness of slipper</th>
<th>Factory spec.</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>3.00 mm</td>
<td>2.90 mm</td>
</tr>
<tr>
<td></td>
<td>0.118 in.</td>
<td>0.114 in.</td>
</tr>
</tbody>
</table>

(1) Piston Slipper  (2) Lubricant Hole

Cylinder Block Face
1. Check the polished face (1) of cylinder block for scoring.
2. If scored, replace the cylinder block assembly.
3. Check the spring (2) for breakage.
4. If broken, replace the cylinder block assembly.

(1) Polished Face  (2) Spring

Valve Plate
1. Check the engagement of the valve plate (1) and the dowel pin (2).
2. Pushing the valve plate against the dowel pin, lift it to remove.
3. Check the valve plate for foreign particles.
4. Clean the valve plate and dry with compressed air.
5. Check the valve plate for scratches, wear and erosion.
6. If worn or scored, replace.

**NOTE**
- Run a fingernail across the valve plate surface. If worn, it will be felt. After checking, coat them with hydrostatic transmission oil.

(1) Valve Plate  (2) Dowel Pin

Swashplate and Thrust Plate
1. Check the bearing surface of trunnion shaft (1) for scratches and excessive wear.
2. If worn or scored, replace.
3. Check the thrust plate (2) for scratches and excessive wear.
4. If worn or scored, replace.

(1) Bearing Surface  (2) Thrust Plate
Trunnion Shaft Cover
1. Check the bearings (1) for scratches and excessive wear.
2. If worn or scored, replace.
3. Check the oil seal (2) and the O-ring (3) for damage.

**NOTE**
- After checking, coat the bearing with hydrostatic transmission oil, and the oil seal lip and the O-ring with grease.

(1) Bearing
(2) Oil Seal
(3) O-ring

Oil Seal and Bearing
1. Remove the collar (3) and internal snap ring (2), (5) and check the oil seals (1), (6) for damage.
2. Check the bearings (7) for wear.
3. If the bearings are worn, replace.

**NOTE**
- After checking, coat the bearing with hydrostatic transmission oil and the oil seal lip with grease.
- When replacing the bearing, press it in the port block so that its mark faces outside and 3.5 mm (0.118 in.) of it remains above the machined surface.
- When reassembling, always replace the oil seal as follows.

(1) Oil Seal
(2) Internal Snap Ring
(3) Collar
(4) Internal Snap Ring
(5) Internal Snap Ring
(6) Oil Seal
(7) Needle Bearing
**Case Relief Valve**
1. Check the valve and the spring for excessive wear and breakage.
2. If worn or broken, replace.

<table>

</tbody>
</table>

**Neutral Valve**
1. Remove the valve assembly and disassemble it.
2. Check the neutral valve (2) for their free movement on or in the valve body (3).
3. If the valve surface is scored, replace.
4. Check the holes of the valve body (3) and the neutral valve (2) for clogging.
5. If clogged, open hole with compressed air.
6. Check the O-rings (1), (5) and the backup ring (4) for scratches and damage.
7. Check the springs for breakage and wear.
8. If anything unusual, replace.

<table>
<thead>

Charge Relief Valve
1. Remove the internal snap ring (5) and draw out the spring holder (4).
2. Check the spring (3) for breakage and wear.
3. Check the O-ring (2) for damage.
4. If anything unusual, replace.

**NOTE**
- Install the internal snap ring with its sharp edge facing outside.

Charge Pump
1. Check the charge pump case (1), the plate (2) and the gerotor set (3) for scratches and wear.
2. If scratched or worn, replace the charge pump complete assembly.
3. Measure the side clearance referring to the figure.
4. If the clearance exceeds the factory specification, replace the charge pump complete assembly.

<table>
<thead>
<tr>
<th>Side clearance</th>
<th>Factory spec.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.030 to 0.060 mm</td>
<td>0.0018 to 0.0236 in.</td>
</tr>
</tbody>
</table>

**NOTE**
- When reassembling, replace the O-rings (6) and the oil seals, and grind the surface of the plate (2) and the charge pump case (1) with finest oil stone.

(1) Charge Pump Case | (4) Straight Edge
(2) Plate | (5) Screw
(3) Gerotor Set | (6) O-ring

Special Tool A for Pressing Oil Seal
1. Make the special tools shown in figure and reassemble the charge pump according to following directions.
Reassembling

1. Place the swashplate in neutral and install the input shaft (11) to the case (13) with the bearing (4) on it.
2. Install the collar (5) on the bearing (4).
3. Coat the O-rings (3), (6) with hydrostatic transmission oil and install them on the case (13).
4. Install the dowel pins (2), (12).
5. Press the oil seal in the charge pump case, using the special tool A, until it is 4 mm (0.157 in.) below the machined surface.
6. Install the internal snap ring with its sharp edge facing outside.
7. Coat the O-rings with hydrostatic transmission oil and install them on the charge pump case (9).
8. Install the gerotor set on the charge pump case and set the plate (10) to it.
9. Set the screw (7) and tighten it, aligning each hole on the plate to each hole on the charge pump case, each other.
10. Install this charge pump assembly to the input shaft, aligning the gerotor splines to the shaft splines and two holes to two dowel pins.
11. Tighten three screws (8).
