This Workshop Manual tells the servicing personnel about the mechanism, servicing and maintenance of BX23S. It contains 4 parts: "Information", "General", "Mechanism", and "Servicing".

**Information**
This section primarily contains information below.
- Safety first
- Safety decal
- Specifications
- Dimensions

**General**
This section primarily contains information below.
- Engine identification
- Model identification
- General precautions
- Maintenance check list
- Check and maintenance
- Special tools

**Mechanism**
This section contains information on the structure and the function of the unit. Before you continue with the subsequent sections, make sure that you read this section.

**Servicing**
This section primarily contains information below.
- Troubleshooting
- Servicing specifications
- Tightening torques
- Checking, disassembling and servicing

All illustrations, photographs and specifications contained in this manual are of the newest information available at the time of publication.
Kubota reserves the right to change all information at any time without notice.
Since this manual includes many models, information or illustrations and photographs can show more than one model.

## 1. INFORMATION

**SAFETY FIRST** .................................................................................................................................................. 1-1

1. Safety first .................................................................................................................................................... 1-1
2. Before you start service ............................................................................................................................ 1-2
3. Start safely .................................................................................................................................................. 1-2
4. Operate safely ............................................................................................................................................ 1-2
5. Protect against high pressure spray ....................................................................................................... 1-3
6. Avoid hot exhaust ..................................................................................................................................... 1-3
7. Exhaust filter cleaning .............................................................................................................................. 1-3
8. Prevent a fire ............................................................................................................................................... 1-4
9. Keep a good airflow in the work area ...................................................................................................... 1-4
10. Discard fluids correctly ........................................................................................................................ 1-4
11. Prevent acid burns .................................................................................................................................. 1-4
12. Prepare for emergencies ........................................................................................................................ 1-5

**SAFETY LABEL** ........................................................................................................................................ 1-7

1. Safety labels for BX tractor ........................................................................................................................ 1-7
2. Safety labels for mower .............................................................................................................................. 1-12
3. Safety labels for loader ............................................................................................................................ 1-13
4. Safety labels for backhoe ........................................................................................................................ 1-15

**SPECIFICATIONS** .................................................................................................................................. 1-17

1. BX tractor specifications ............................................................................................................................ 1-17
2. Mower specifications ................................................................................................................................ 1-19
3. Loader specifications ................................................................................................................................ 1-20
   3.1 Loader specifications ............................................................................................................................ 1-20
   3.2 Bucket specifications ............................................................................................................................ 1-21
   3.3 Dimensional specifications of loader ................................................................................................ 1-22
   3.4 Operational specifications of loader ................................................................................................ 1-23
4. Backhoe specifications ................................................................................................................................ 1-25
   4.1 Backhoe specifications ........................................................................................................................ 1-25
   4.2 Backhoe dimensions ............................................................................................................................ 1-26
   4.3 Backhoe lift capacity ............................................................................................................................ 1-27

**TRAVELING SPEEDS** ................................................................................................................................ 1-29

**DIMENSIONS** .......................................................................................................................................... 1-31

## 2. GENERAL

**IDENTIFICATION** ..................................................................................................................................... 2-1

1. Tractor identification ................................................................................................................................ 2-1
   1.1 Checking serial number and hour meter ............................................................................................ 2-1
   1.2 Cylinder number ................................................................................................................................ 2-1
2. Checking mower identification .................................................................................................................. 2-2
3. Checking loader identification .................................................................................................................. 2-2
4. Checking backhoe identification .............................................................................................................. 2-2

**GENERAL PRECAUTIONS** ....................................................................................................................... 2-3

**HANDLING PRECAUTIONS FOR ELECTRICAL PARTS AND WIRING** .................................................. 2-5

**LUBRICANTS, FUEL AND COOLANT** ......................................................................................................... 2-7

1. BX tractor .................................................................................................................................................... 2-7
   1.1 Lubricants, fuel, and coolant ................................................................................................................ 2-7
      1.1.1 Fuel .............................................................................................................................................. 2-8
      1.1.2 Engine oil ................................................................................................................................. 2-8
      1.1.3 Transmission oil ....................................................................................................................... 2-8
      1.2 Overview of biodiesel fuel (BDF) ................................................................................................. 2-9
2. Mower ........................................................................................................................................................ 2-11
2.1 Lubricants .............................................................................................................................................. 2-11

**TIGHTENING TORQUES** ........................................................................................................................... 2-13
1. General use screws, bolts and nuts ................................................................. 2-13
2. Stud bolts ........................................................................................................ 2-13
3. Metric screws, bolts and nuts ........................................................................... 2-14
4. American standard screws, bolts and nuts with UNC or UNF threads .......... 2-14
5. Plugs ................................................................................................................. 2-14
6. Adapters, elbows and others .......................................................................... 2-15

MAINTENANCE CHECK LIST ................................................................................. 2-17
1. BX tractor service intervals ........................................................................... 2-17
2. Mower service intervals .................................................................................. 2-19

CHECK AND MAINTENANCE ............................................................................ 2-21
1. Periodic service ................................................................................................ 2-21
   1.1 Opening bonnet ....................................................................................... 2-21
   1.2 Daily check .............................................................................................. 2-21
      1.2.1 Walk around inspection ................................................................. 2-21
      1.2.2 Checking fuel gauge and refueling ................................................. 2-21
      1.2.3 Checking engine oil level ............................................................... 2-22
      1.2.4 Checking transmission fluid level .................................................. 2-22
      1.2.5 Checking coolant level ..................................................................... 2-22
      1.2.6 Cleaning panel and radiator screen ............................................... 2-23
      1.2.7 Checking brake pedal ...................................................................... 2-24
      1.2.8 Checking gauges, meters, and Easy Checker™ ................................ 2-24
      1.2.9 Checking head light, hazard light, and tail light ............................. 2-24
      1.2.10 Checking seat belt and ROPS ....................................................... 2-24
      1.2.11 Checking and cleaning electrical wiring and battery cables ......... 2-24
      1.2.12 Checking movable parts ............................................................... 2-25
   1.3 Check points of initial 50 hours ................................................................. 2-25
      1.3.1 Changing engine oil ........................................................................ 2-25
      1.3.2 Replacing engine oil filter ............................................................... 2-25
      1.3.3 Replacing transmission oil filter ..................................................... 2-26
      1.3.4 Changing transmission fluid ......................................................... 2-26
      1.3.5 Cleaning transmission strainer ....................................................... 2-27
   1.4 Check points of every 50 hours ................................................................. 2-27
      1.4.1 Greasing ......................................................................................... 2-27
      1.4.2 Checking engine start system ......................................................... 2-29
      1.4.3 Checking operator presence control (OPC) system ......................... 2-29
      1.4.4 Checking wheel bolt torque ....................................................... 2-30
      1.4.5 Cleaning lock lever shaft ............................................................... 2-30
   1.5 Check points of every 100 hours ............................................................... 2-30
      1.5.1 Checking battery condition ............................................................. 2-30
      1.5.2 Cleaning air cleaner element ........................................................ 2-32
      1.5.3 Checking fuel filter ....................................................................... 2-32
      1.5.4 Adjusting fan belt tension ............................................................... 2-33
      1.5.5 Adjusting HST neutral spring ....................................................... 2-33
      1.5.6 Adjusting brake pedal ................................................................. 2-34
   1.6 Check point of every 200 hours ................................................................. 2-34
      1.6.1 Replacing engine oil filter ............................................................. 2-34
      1.6.2 Changing engine oil ................................................................. 2-35
      1.6.3 Replacing transmission oil filter ................................................... 2-35
      1.6.4 Adjusting toe-in ................................................................. 2-36
   1.7 Check points of every 400 hours ............................................................ 2-36
      1.7.1 Adjusting front axle pivot ............................................................ 2-36
      1.7.2 Changing transmission fluid .................................................... 2-37
      1.7.3 Cleaning transmission strainer ................................................... 2-38
      1.7.4 Changing front axle case oil ....................................................... 2-38
      1.7.5 Replacing fuel filter element ....................................................... 2-38
   1.8 Check points of every 800 hours ............................................................. 2-39
      1.8.1 Adjusting engine valve clearance ............................................. 2-39
   1.9 Check points of every 1000 hours or 1 year ........................................... 2-39
1.9.1 Replacing air cleaner element........................................................................................................2-39
1.10 Check points of every 1500 hours...........................................................................................................2-39
  1.10.1 Checking injection pressure of fuel injection nozzle.........................................................................2-39
1.11 Check points of every 2000 hours or 2 years.........................................................................................2-39
  1.11.1 Flushing cooling system and changing coolant................................................................................2-39
  1.11.2 Antifreeze...........................................................................................................................................2-40
1.12 Check points of every 3000 hours.................................................................................................................2-41
  1.12.1 Checking injection pump....................................................................................................................2-41
1.13 Check points of every 1 year.........................................................................................................................2-41
  1.13.1 Checking intake air line.......................................................................................................................2-41
  1.13.2 Checking radiator hoses and hose clamps.........................................................................................2-41
  1.13.3 Checking power steering line.............................................................................................................2-41
  1.13.4 Checking fuel lines.............................................................................................................................2-42
  1.13.5 Checking engine breather hose..........................................................................................................2-42
1.14 Check points of every 4 years.........................................................................................................................2-43
  1.14.1 Replacing radiator hose.......................................................................................................................2-43
  1.14.2 Replacing fuel hose .............................................................................................................................2-43
  1.14.3 Replacing power steering hose...........................................................................................................2-43
  1.14.4 Replacing intake air line.......................................................................................................................2-43
  1.14.5 Replacing engine breather hose..........................................................................................................2-43
1.15 Service as required........................................................................................................................................2-43
  1.15.1 Bleeding fuel system............................................................................................................................2-43
  1.15.2 Replacing fuse ......................................................................................................................................2-43
  1.15.3 Replacing light bulb .............................................................................................................................2-44
2. Mower...............................................................................................................................................................2-44
  2.1 Check points of daily or each use............................................................................................................2-44
    2.1.1 Retightening mower blade screw........................................................................................................2-44
    2.1.2 Checking mower blade.......................................................................................................................2-45
    2.1.3 Checking mower belt ........................................................................................................................2-45
    2.1.4 Checking gear box oil level................................................................................................................2-45
    2.1.5 Greasing spindle shafts, belt tension pivot and tension pulley.........................................................2-46
    2.1.6 Greasing front and rear anti-scalp rollers.........................................................................................2-46
    2.1.7 Greasing universal joint.....................................................................................................................2-46
  2.2 Check points of initial 50 hours................................................................................................................2-47
    2.2.1 Changing gear box oil.........................................................................................................................2-47
  2.3 Check point of every 150 hours................................................................................................................2-47
    2.3.1 Changing gear box oil.........................................................................................................................2-47
  2.4 Check points of every 1 year......................................................................................................................2-47
    2.4.1 Checking gear box oil seal................................................................................................................2-47
  2.5 Check point of every 4 years......................................................................................................................2-48
    2.5.1 Replacing gear box oil seal................................................................................................................2-48
3. Front loader.......................................................................................................................................................2-48
  3.1 Check points of daily or each use............................................................................................................2-48
    3.1.1 Checking transmission fluid level.......................................................................................................2-48
    3.1.2 Checking hydraulic hoses..................................................................................................................2-48
  3.2 Check points of every 10 hours................................................................................................................2-49
    3.2.1 Greasing loader.................................................................................................................................2-49
  3.3 Check points of every 50 hours................................................................................................................2-49
    3.3.1 Checking torque of main frame bolt and nut.......................................................................................2-49
4. Backhoe...........................................................................................................................................................2-49
  4.1 Check points of daily or each use............................................................................................................2-49
    4.1.1 Checking transmission fluid level.......................................................................................................2-49
    4.1.2 Checking hydraulic hoses..................................................................................................................2-49
    4.1.3 Checking backhoe mounting pin.........................................................................................................2-50
  4.2 Check points of every 10 hours................................................................................................................2-50
    4.2.1 Greasing backhoe.............................................................................................................................2-50
  4.3 Check points of every 50 hours................................................................................................................2-51
    4.3.1 Checking torque sub frame bolt and nut............................................................................................2-51
TIRES, WHEELS, AND BALLAST ............................................................................................................................. 2-53
1. Tires .................................................................................................................................................................. 2-53
   1.1 Inflation pressure of tires .......................................................................................................................... 2-53
   1.2 Dual tires .................................................................................................................................................. 2-53
2. Wheel tread .................................................................................................................................................... 2-53
   2.1 Front wheels ............................................................................................................................................ 2-54
   2.2 Rear wheels ............................................................................................................................................ 2-54
3. Ballast ............................................................................................................................................................ 2-55
   3.1 Front ballast ............................................................................................................................................ 2-55
   3.2 Rear ballast ............................................................................................................................................ 2-55
IMPLEMENT LIMITATIONS .................................................................................................................................... 2-57
1. Implement limitation tables .......................................................................................................................... 2-57
SPECIAL TOOLS ................................................................................................................................................. 2-61
1. Special tools for engine .................................................................................................................................... 2-61
   1.1 Special use puller set .................................................................................................................................. 2-61
   1.2 Diesel engine compression tester (for injection nozzle) .......................................................................... 2-61
   1.3 Nozzle tester ........................................................................................................................................... 2-61
   1.4 Injection pump pressure tester .................................................................................................................. 2-61
   1.5 Valve guide replacing tool ........................................................................................................................ 2-62
   1.6 Bushing replacing tool .............................................................................................................................. 2-63
   1.7 Flywheel stopper ....................................................................................................................................... 2-64
   1.8 Crankshaft bearing 1 replacing tool ...................................................................................................... 2-64
2. Special tools for tractor .................................................................................................................................... 2-65
   2.1 Tie-rod end lifter ....................................................................................................................................... 2-65
   2.2 Independent PTO clutch spring compression tool ............................................................................... 2-65
   2.3 Disassembling and assembling stand (1/2) .......................................................................................... 2-66
   2.4 Disassembling and assembling stand (2/2) ....................................................................................... 2-68
   2.5 Check and high pressure relief valve assembly tool ........................................................................... 2-70

3. ENGINE
MECHANISM ...................................................................................................................................................... 3-1
1. Engine body .................................................................................................................................................. 3-1
   1.1 Function of cylinder block ...................................................................................................................... 3-1
   1.2 Function of closed breather ..................................................................................................................... 3-1
   1.3 Function of half-floating head cover ...................................................................................................... 3-1
   1.4 Function of piston ................................................................................................................................... 3-2
   1.5 Function of piston ring ............................................................................................................................ 3-2
   1.6 Function of connecting rod ..................................................................................................................... 3-2
   1.7 Function of crankshaft ............................................................................................................................ 3-2
   1.8 Function of camshaft .............................................................................................................................. 3-3
   1.9 Function of rocker arm ........................................................................................................................... 3-3
   1.10 Function of flywheel ............................................................................................................................ 3-3
   1.11 Function of timing gears ....................................................................................................................... 3-4
2. Lubricating system ......................................................................................................................................... 3-5
   2.1 Overview of lubricating system ............................................................................................................... 3-5
   2.2 Function of oil strainer ........................................................................................................................... 3-7
   2.3 Function of oil pump ............................................................................................................................... 3-7
   2.4 Function of oil filter ................................................................................................................................ 3-7
   2.5 Function of relief valve .......................................................................................................................... 3-8
   2.6 Function of oil pressure switch .............................................................................................................. 3-8
3. Cooling system .............................................................................................................................................. 3-9
   3.1 Overview of cooling system ..................................................................................................................... 3-9
   3.2 Function of water pump ......................................................................................................................... 3-11
   3.3 Function of radiator ............................................................................................................................... 3-11
   3.4 Function of radiator cap ........................................................................................................................ 3-11
4. Fuel system .................................................................................................................................................... 3-12
   4.1 Overview of fuel system ........................................................................................................................ 3-12
   4.2 Function of fuel filter .............................................................................................................................. 3-12
4. TRANSAXLE

MECHANISM ........................................................................................................................................... 4-1

1. Structure of transaxle ................................................................................................................................ 4-1

2. Traveling system .......................................................................................................................................... 4-2

2.1 Hydrostatic transmission .......................................................................................................................... 4-2

2.1.1 Structure of hydrostatic transmission .................................................................................................. 4-2

2.1.2 Oil flow of hydrostatic transmission ..................................................................................................... 4-3

2.1.3 Structure of HST control linkage ........................................................................................................ 4-8

2.1.4 Speed set linkage .................................................................................................................................. 4-9

2.2 Range gear shift section ............................................................................................................................ 4-12

2.2.1 Structure of range gear shift .................................................................................................................. 4-12

2.3 Front wheel drive section ........................................................................................................................... 4-13

2.3.1 Structure of front wheel drive ............................................................................................................... 4-13

2.4 Differential gear section ............................................................................................................................ 4-14

2.4.1 Structure of differential gears .............................................................................................................. 4-14

2.4.2 Structure of differential lock .................................................................................................................. 4-16

2.5 Brake section ............................................................................................................................................ 4-17

2.5.1 Structure of brake system ...................................................................................................................... 4-17

3. PTO system ................................................................................................................................................ 4-19

3.1 Structure of PTO system .......................................................................................................................... 4-19

3.1.1 Function of PTO clutch relief valve ..................................................................................................... 4-20

3.1.2 Engaged function of PTO clutch .......................................................................................................... 4-20

3.1.3 Disengaged function of PTO clutch ..................................................................................................... 4-20
3.2 Structure of mid and rear PTO

4. Others

4.1 Hydraulic pump drive gear section

4.1.1 Structure of hydraulic pump drive gear

SERVICING

1. Troubleshooting for transaxle

2. Servicing specifications for transaxle

3. Tightening torques for transaxle

4. Checking and adjusting

4.1 Adjusting maximum speed

4.2 Adjusting HST neutral position

4.3 Checking and adjusting HST neutral spring (dynamic braking)

4.4 Checking charge relief pressure

4.5 Checking high relief pressure (Forward)

4.6 Checking high relief pressure (Reverse)

4.7 Readjusting relief valve (When HST does not work due to its loose hexagon socket head screw)

4.8 Checking PTO clutch operating pressure

4.9 Adjusting brake pedal free travel

4.10 Adjusting brake pedal return spring

5. Disassembling and assembling

5.1 Separating transaxle

5.1.1 Draining transmission fluid

5.1.2 Removing battery

5.1.3 Removing lift rod and lower link

5.1.4 Removing ROPS

5.1.5 Removing seat

5.1.6 Removing step

5.1.7 Removing fender

5.1.8 Removing fuel tank

5.1.9 Removing rear wheel

5.1.10 Removing fender center stay

5.1.11 Removing fender bracket and hitch plate

5.1.12 Removing transaxle assembly

5.1.13 Removing brake pedal

5.1.14 Removing propeller shaft

5.1.15 Removing differential lock pedal

5.1.16 Removing speed control pedal, HST damper, and cruise rod

5.2 Hydrostatic transmission

5.2.1 Removing levers and mower lift arm

5.2.2 Removing PTO clutch valve

5.2.3 Removing oil cooler cover

5.2.4 Removing center section and valve plates

5.2.5 Removing check and high pressure relief valve plug

5.2.6 Checking check and high pressure relief valve

5.2.7 Removing cylinder block

5.2.8 Removing cylinder block and piston

5.2.9 Removing swashplate and trust roller bearing

5.2.10 Removing 4WD detent ball

5.2.11 Removing neutral arm and trunnion arm

5.3 Hydraulic cylinder

5.3.1 Removing hydraulic cylinder

5.4 Transaxle shafts

5.4.1 Removing transaxle case front cover

5.4.2 Removing hydraulic pump assembly

5.4.3 Removing rear PTO cover assembly

5.4.4 Disassembling rear axle (L.H.)

5.4.5 Removing rear axle case (R.H.)

5.4.6 Removing 66T final gear

5.4.7 Removing rear axle case, R.H. and brake
5. FRONT AXLE

MECHANISM ........................................................................................................................................... 5-1
1. Structure of front axle .......................................................................................................................... 5-1
2. Front wheel alignment ........................................................................................................................... 5-2
2.1 Camber of front axle .......................................................................................................................... 5-2
2.2 Kingpin angle of front axle ................................................................................................................. 5-2
2.3 Caster of front axle .............................................................................................................................. 5-2
2.4 Toe-in of front axle ............................................................................................................................ 5-2

SERVICING .................................................................................................................................................. 5-5
1. Troubleshooting for front axle .............................................................................................................. 5-5
2. Servicing specifications for front axle ................................................................................................... 5-6
3. Tightening torques for front axle .......................................................................................................... 5-7
4. Checking and adjusting ......................................................................................................................... 5-8
4.1 Adjusting toe-in .................................................................................................................................. 5-8
4.2 Adjusting front axle rocking force ..................................................................................................... 5-8
4.3 Adjusting front wheel steering angle ................................................................................................. 5-9
5. Disassembling and assembling ............................................................................................................. 5-9
5.1 Separating front axle assembly .......................................................................................................... 5-9
5.1.1 Draining front axle case oil ........................................................................................................... 5-9
5.1.2 Removing battery ........................................................................................................................... 5-9
5.1.3 Removing bonnet .......................................................................................................................... 5-10
5.1.4 Removing front wheel and propeller shaft cover ........................................................................ 5-10
5.1.5 Disconnecting propeller shaft ....................................................................................................... 5-10
5.1.6 Removing front axle assembly ...................................................................................................... 5-11
5.2 Front axle assembly ............................................................................................................................. 5-11
5.2.1 Removing power steering cylinder ............................................................................................... 5-11
5.2.2 Removing bevel gear case and front gear case ............................................................................ 5-12
5.2.3 Removing front gear case cover .................................................................................................... 5-12
6. STEERING
MECHANISM ....................................................................................................................... 6-1
1. Structure of steering system ......................................................................................... 6-1
2. Hydraulic circuit of steering ....................................................................................... 6-2
3. Steering controller ........................................................................................................ 6-3
   3.1 Structure of steering controller ............................................................................... 6-3
   3.1.1 Control valve ..................................................................................................... 6-3
   3.1.2 Metering device ............................................................................................... 6-3
   3.1.3 Relief valve ...................................................................................................... 6-4
4. Steering cylinder .......................................................................................................... 6-5
   4.1 Structure of steering cylinder ............................................................................... 6-5
SERVICING ......................................................................................................................... 6-7
1. Troubleshooting for steering ....................................................................................... 6-7
2. Servicing specifications for steering ............................................................................ 6-9
3. Tightening torques for steering ................................................................................... 6-10
4. Checking and adjusting ............................................................................................... 6-11
5. Disassembling and assembling .................................................................................... 6-11
   5.1 Power steering cylinder ......................................................................................... 6-11
      5.1.1 Removing adapter and tie-rod ....................................................................... 6-11

  6.3 Checking piston rod bend ......................................................................................................... 11-41
1. INFORMATION
SAFETY FIRST

1. Safety first

This symbol, the industry's "Safety Alert Symbol", is used throughout this manual and on labels on the machine itself to warn of the possibility of personal injury. Read these instructions carefully. It is essential that you read the instructions and safety regulations before you try to repair or use this unit.

⚠️ DANGER
• Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.

⚠️ WARNING
• Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

⚠️ CAUTION
• Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury.

■ IMPORTANT
• Indicates that equipment or property damage could result if instructions are not followed.

■ NOTE
• Gives helpful information.
2. Before you start service

- Read all instructions and safety instructions in this manual and on your machine safety decals.
- Clean the work area and machine.
- Park the machine on a stable and level ground, and set the parking brake.
- Lower the implement to the ground.
- Stop the engine, then remove the key.
- Disconnect the battery negative cable.
- Hang a “DO NOT OPERATE” tag in the operator station.

3. Start safely

- Do not do the procedures below when you start the engine.
  1. Short across starter terminals.
  2. Bypass the safety start switch.
- Do not alter or remove any part of machine safety system.
- Before you start the engine, make sure that all shift levers are in neutral positions or in disengaged positions.
- Do not start the engine when you stay on the ground. Start the engine only from operator's seat.

4. Operate safely

- Do not use the machine after you consume alcohol or medication or when you are tired.
- Put on applicable clothing and safety equipment.
- Use applicable tools only. Do not use alternative tools or parts.
- When 2 or more persons do servicing, make sure that you do it safely.
- Do not touch the hot parts or parts that turn when the engine operates.
- Do not remove the radiator cap when the engine operates, or immediately after it stops. If not, hot water can spout out from the radiator. Only remove the radiator cap when it is at a sufficiently low temperature to touch with bare hands. Slowly
loosen the cap to release the pressure before you remove it fully.
• Released fluid (fuel or hydraulic oil) under pressure can cause damage to the skin and cause serious injury. Release the pressure before you disconnect hydraulic or fuel lines. Tighten all connections before you apply the pressure.
• Do not open a fuel system under high pressure. The fluid under high pressure that stays in fuel lines can cause serious injury. Do not disconnect or repair the fuel lines, sensors, or any other components between the fuel pump and injectors on engines with a common rail fuel system under high pressure.
• Put on an applicable ear protective device (earmuffs or earplugs) to prevent injury against loud noises.
• Be careful about electric shock. The engine generates a high voltage of more than DC100 V in the ECU and is applied to the injector.

5. Protect against high pressure spray

• Spray from high pressure nozzles can penetrate the skin and cause serious injury. Keep spray from contacting hands or body.
• If an accident occurs, see a doctor immediately. Any high pressure spray injected into the skin must be surgically removed within a few hours or gangrene may result. Doctors unfamiliar with this type of injury should reference a knowledgeable medical source.

6. Avoid hot exhaust

• Servicing machine or attachments with engine operating can result in serious personal injury. Avoid exposure and skin contact with hot exhaust gases and components.
• Exhaust parts and streams become very hot during operation. Exhaust gases and components reach temperatures hot enough to burn people, ignite, or melt common materials.

7. Exhaust filter cleaning

• Servicing machine or attachments during exhaust filter cleaning can result in serious personal injury. Avoid exposure and skin contact with hot exhaust gases and components.
• During auto or manual/stationary exhaust filter cleaning operations, the engine will operate at elevated idle and hot temperatures for an extended period of time. Exhaust gases and exhaust filter components reach temperatures hot enough to burn people, or ignite, or melt common materials.
8. Prevent a fire

- Fuel is very flammable and explosive under some conditions. Do not smoke or let flames or sparks in your work area.
- To prevent sparks from an accidental short circuit, always disconnect the battery negative cable first and connect it last.
- The battery gas can cause an explosion. Keep the sparks and open flame away from the top of battery, especially when you charge the battery.
- Make sure that you do not spill fuel on the engine.

9. Keep a good airflow in the work area

- If the engine is in operation, make sure that the area has good airflow. Do not operate the engine in a closed area. The exhaust gas contains poisonous carbon monoxide.

10. Discard fluids correctly

- Do not discard fluids on the ground, down the drain, into a stream, pond, or lake. Obey related environmental protection regulations when you discard oil, fuel, coolant, electrolyte and other dangerous waste.

11. Prevent acid burns

- Keep electrolyte away from your eyes, hands and clothing. Sulfuric acid in battery electrolyte is poisonous and it can burn your skin and clothing and cause blindness. If you spill electrolyte on yourself, clean yourself with water, and get medical aid immediately.
12. Prepare for emergencies

- Keep a first aid kit and fire extinguisher ready at all times.
- Keep the emergency contact telephone numbers near your telephone at all times.
1. Safety labels for BX tractor

The safety labels are installed on the machine. If a label becomes damaged, illegible or is not on the machine, replace it. The label part number is listed in the parts list.
1. INFORMATION

SAFETY LABEL

1-8 BX23S, LA340, BT603, RCK54D, RCK60D, RCK54, RCK60B

KiSC issued 03, 2017 A
1. INFORMATION

SAFETY LABEL

(1) Part No. K2871-6541-1

**DANGER**

TO AVOID POSSIBLE INJURY OR DEATH FROM A MACHINE RUNAWAY:
1. Do not start engine by shorting across starter terminals or bypassing the safety start switch. Machine may start in gear and move if normal starting circuitry is bypassed.
2. Start engine only from operator’s seat with transmission and PTO off. Never start engine while standing on the ground.

1AGAJAXAP049E

(3) Part No. K2581-6543-1

Stay clear of engine fan and fanbelt.

1AGAJAXAP052E

(2) Part No. K2581-6547-1

Stay clear of engine fan and fanbelt.

1AGAJAXAP049E

1BXMC00018A01

1BXMC00019A01

1BXMC00094A02

1PSQW00007A01
2. Safety labels for mower

The safety labels are installed on the mower. If a label becomes damaged, illegible or is not on the mower, replace it. The label part number is listed in the parts list.

![Safety labels for mower](image)

[Part No. K5112-7311-2]

- **DANGER**
  1. Stay clear of discharge opening at all times.
  2. Do not put hands or feet into mower when engine is running.
  3. Do not operate mower without discharge deflector.

![Safety labels for mower](image)

[Part No. K5112-7312-2]

- **DANGER**
  Do not put hands or feet into mower when engine is running.

![Safety labels for mower](image)

[Part No. K5384-4715-1]

- **WARNING**
  To avoid serious injury or death:
  1. Keep all shields in place.
  2. Stop engine and wait until blades stop before leaving operator position.
  3. Keep hands, feet, and clothing away from all moving or rotating parts.
  4. Make sure area of operation is clear of all persons and foreign objects.
  5. Stop mower blades when crossing gravel, driveways, or roads.

![Safety labels for mower](image)

[Part No. K5384-4171-1]

- **WARNING**
  To avoid serious injury of death:
  Make sure the PTO shaft lock:
  (yellow handle; push rearward) and rear deck lock (pin handle; rotate counter clockwise) locking levers are fully engaged and locked before operating the mower deck.
3. Safety labels for loader

The safety labels are installed on the loader. If a label becomes damaged, illegible or is not on the loader, replace it. The label part number is listed in the parts list.
1. INFORMATION

SAFETY LABEL

(1) Part No. 7J526-3648-1

DANGER

TO AVOID PERSONAL INJURY OR DEATH

1. Make sure both handles (LH, RH) contact the ear plate (A) at the points and are all the way down.

2. Make sure both lock pins (LH, RH) protrude through the pin slots (D).

Kubota recommends the use of Kubota attachments on Kubota loaders. Use of a non-Kubota attachment that does not comply with SAE J513 or the improper positioning of handle(s) or non-prominence of pin(s) may result in the attachment or deformation, causing loss of performance, personal injury or death.

For information, contact your Kubota Dealer.

(2) Part No. 7J048-3923-4

DANGER

PALLET FORK RATED CAPACITY

LA40, LA90A, LA95A: 800 LBS.
LA40: 300 LBS.
LA34: 240 LBS.

TO AVOID PERSONAL INJURY OR DEATH CAUSED BY ROLLOVER

- Do not exceed rated load listed above.
- Use rear implement and tire ballast recommended in loader operator’s manual.
- Operate tractor slowly taking special care when turning.

(3) Part No. 7J248-5643-1

DANGER

TO AVOID SERIOUS INJURY OR DEATH CAUSED BY FALLING LOADS:

1. Load on raised bucket or fork can fall or roll back onto operator causing serious injury or death.
2. Use approved clamping and/or guard attachments for handling large, loose or shiftable loads such as bales, posts, sheets of plywood etc.
3. Carry loads as low as possible.

[BX2415 Pallet Fcrk]
4. Safety labels for backhoe

The safety labels are installed on the backhoe. If a label becomes damaged, illegible or is not on the backhoe, replace it. The label part number is listed in the parts list.

**DANGER, WARNING AND CAUTION LABELS OF THE BACKHOE**

1. **WARNING**
   - To avoid personal injury: when mounting and dismounting the backhoe.
   - Set the swing lock pin, and lower the boom to the ground when leaving the operator's seat.

2. **WARNING**
   - To avoid serious crushing injury or death: make sure boom swing lock pin is installed from operator's seat before entering this area.

3. **WARNING**
   - To avoid personal injury: keep both feet on foot platform and away from stabilizer.

4. **WARNING**
   - To avoid personal injury: when starting the engine, always sit in the operator's seat.
   - When getting off the tractor, make sure that PTO lever is off and range gear shift lever is in neutral. Then set the parking brake.
   - Keep hands, feet and body from between tractor and backhoe. Never allow any part of body under the machine.

5. **DANGER**
   - To avoid serious crushing injury or death: make sure boom swing lock pin is installed from operator's seat before entering this area.
[BX6316 MECHANICAL THUMB] (Option for BT603)

(1) Part No. 7K523-8452-1 (Both sides)

WARNING

TO AVOID INJURY FROM CRUSHING:
Keep all body parts (Head, Arms, Hands, Legs, and Feet) out of the operating area of the Thumb and Backhoe Bucket.

</table>
2. GENERAL
1. Tractor identification

1.1 Checking serial number and hour meter

- When contacting your local KUBOTA distributor, always specify engine serial number, tractor serial number and hour meter reading.

1.2 Cylinder number

The cylinder numbers of KUBOTA diesel engine are designated as shown in the figure.

The sequence of cylinder numbers is given as No.1, No.2 and No.3 starting from the gear case side.
2. Checking mower identification

- When contacting your local KUBOTA distributor, always specify mower serial number.

3. Checking loader identification

- When contacting your local KUBOTA distributor, always specify loader serial number.

4. Checking backhoe identification

- When contacting your local KUBOTA distributor, always specify backhoe serial number.
GENERAL PRECAUTIONS

- Before you disassemble or repair machine, make sure that you always disconnect the ground cable from the battery first.
- Remove oil and dirt from parts before you measure.
- Use KUBOTA genuine parts for replacement to keep the machine performance and to make sure of safety.
- You must replace the gaskets and O-rings when you assemble again. Apply grease (1) to new O-rings or oil seals before you assemble.
- When you assemble the external or internal snap rings, make sure that the sharp edge (3) faces against the direction from which force (2) is applied.
- When inserting spring pins, their splits must face the direction from which a force is applied.
- To prevent damage to the hydraulic system, use specified fluid or equivalent.
- Clean the parts before you measure them.
- Tighten the fittings to the specified torque. Too much torque can cause damage to the hydraulic units or the fittings. Not sufficient torque can cause oil leakage.
- When you use a new hose or pipe, tighten the nuts to the specified torque. Then loosen (approx. by 45°) and let them be stable before you tighten to the specified torque (This is not applied to the parts with seal tape.).
- When you remove the two ends of a pipe, remove the lower end first.
- Use two pliers in removal and installation. One to hold the stable side, and the other to turn the side you remove to prevent twists.
- Make sure that the sleeves of flared connectors and tapers of hoses are free of dust and scratches.
- After you tighten the fittings, clean the joint and apply the maximum operation pressure 2 to 3 times to check oil leakage.
HANDLING PRECAUTIONS FOR ELECTRICAL PARTS AND WIRING

IMPORTANT

- Check electrical wiring for damage and loosened connection every year. To this end, educate the customer to do his or her own check and at the same time recommend the dealer to perform periodic check for a fee.
- Do not try to modify or remodel any electrical parts and wiring.
- When removing the battery cables, disconnect the negative cable first. When installing the battery cables, connect the positive cable first.

(1) Negative terminal  (2) Positive terminal

To ensure safety and prevent damage to the machine and surrounding equipment, heed the following precautions in handling electrical parts and wiring.
# LUBRICANTS, FUEL AND COOLANT

## 1. BX tractor

### 1.1 Lubricants, fuel, and coolant

**IMPORTANT**
- To prevent serious damage to hydraulic systems, use only KUBOTA genuine fluid or its equivalent.

<table>
<thead>
<tr>
<th>No.</th>

</tr>
</tbody>
</table>

*₁ Oil amount when the oil level is at the upper level of the oil level gauge.

*₂ The product name of KUBOTA genuine UDT fluid may be different from that in the operator's manual depending on countries or territories.
1.1.1 Fuel

- Use the ultra low sulfur diesel fuel only [below 0.0015 % (15 ppm)] for these engines.
- Cetane number of 45 minimum. Cetane number greater than 50 is preferred, especially for temperatures below −20 °C (−4 °F) or elevations above 1500 m (5000 ft).
- Diesel fuels specified to EN 590 or ASTM D975 are recommended.
- No.2-D is a distillate fuel of lower volatility for engines in industrial and heavy mobile service. (SAE J313 JUN87)

1.1.2 Engine oil

- Oil used in the engine should have an American Petroleum Institute (API) service classification and Proper SAE Engine Oil according to the ambient temperatures.
- Refer to the following table for the suitable API classification engine oil according to the engine type (with internal EGR, external EGR or non-EGR) and the fuel.

<table>
<thead>
<tr>
<th>Fuel used</th>
<th>Engine oil classification (API classification)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Oil class of engines except external EGR</td>
</tr>
<tr>
<td>Ultra Low Sulfur Fuel [&lt; 0.0015% (&lt; 15 ppm)]</td>
<td>CF, CF-4, CG-4, CH-4 or CI-4</td>
</tr>
<tr>
<td></td>
<td>(Class CF-4, CG-4 and CH-4 engine oils cannot be used on EGR type engines)</td>
</tr>
</tbody>
</table>

EGR:
Exhaust gas re-circulation

- The CJ-4 engine oil is intended for diesel particulate filter (DPF) type engines, and cannot be used on this tractor.

1.1.3 Transmission oil

*KUBOTA Super UDT-2: For an enhanced ownership experience, we highly recommend Super UDT-2 to be used instead of standard hydraulic/transmission fluid. Super UDT-2 is a proprietary KUBOTA formulation that delivers superior performance and protection in all operating conditions. Regular UDT is also permitted for use in this machine.
- Indicated capacities of water and oil are manufacturer’s estimate.
1.2 Overview of biodiesel fuel (BDF)

B0-B20 biodiesel fuels (BDF)

You can use mixed diesel fuels containing 20% or less biodiesel under the following conditions.

**IMPORTANT**
- Concentrations greater than B5 (5%) are not approved for common rail engines and engines with aftertreatment device. Using concentrations greater than B5 (5%) can cause damage and reduce engine life.
- Refuel and use the fuel with caution in order to avoid contact with the fuel and spillage that could create a potential environmental or fire hazard. Wear appropriate protective equipment when refueling.

Applicable BDF
- You can use blended diesel fuels containing 6% through 20% BDF (B6-B20) which comply with American society for testing and materials (ASTM) D7467 standard, as revised, without adversely affecting the performance and durability of the engine and the components of the fuel system.
- Any mineral-oil-diesel-fuel, if used, must conform to ASTM D975 (or the European EN590) Standard, as revised. B100 fuel used to generate biodiesel-blended-fuels must meet ASTM D6751 (or EN14214) Standard, as revised. The final blended fuel B20 must conform to ASTM D7467 standard, as revised.
- Straight-vegetable-oil is not allowed in any blended fuel.
- Allowable blended fuel is mineral-oil-diesel-fuel blended with B100 (for example 100% BDF). The blended fuel ratio shall be less than 20% B100 and 80% or more diesel fuel.

Purchasing the B100 source used for biodiesel blends from an accredited BQ-9000 marketer or producer. You can find more information about qualified marketer(s) and producer(s) at [http://www.bq-9000.org](http://www.bq-9000.org).

Product warranty, emission, and other precautions
- The engine-emission-control-system was certified according to current regulations based on the use of non-BDF. When using BDF, the owner is advised to check applicable local and federal emission regulations, and comply with all of them.
- BDF may cause restricted or clogged fuel filters during cold weather conditions, resulting in the engine not operating properly.
- BDF encourages the growth of microorganisms which may cause degradation of the fuel. Degradation of the fuel may cause corrosion of the fuel line or reduce the fuel filter flow earlier than expected.
- BDF inherently absorbs moisture which may cause degradation of the fuel earlier than expected. To avoid absorbing moisture of BDF, drain the water separator and the fuel-filter-port often.
- Do not use biodiesel whose concentrations higher than 20% (for example, greater than B20). Higher concentrated biodiesel will affect engine performance and fuel consumption, and degradation of the fuel system components may occur.
- Do not readjust the engine-fuel-control-system because readjusting it will violate the emission-control-levels for which the equipment was approved.
- Compared with soybean-based and rapeseed-based feedstock, palm-oil-based feedstock has a thicker consistency (for example, higher viscosity) at lower temperatures. Consequently, palm-oil-based feedstock may reduce performance of the fuel filter, particularly during cold weather conditions.
- The KUBOTA warranty, as specified in the Owner's Warranty Information Guide, only covers flaws in product materials and workmanship. Accordingly, The KUBOTA warranty do not cover any problems that may arise due to the use of poor quality fuels that fail to meet the preceding requirements, whether biodiesel or mineral-oil-based.

Routine using
- Avoid spilling BDF onto painted surfaces because this may damage the finish. If the fuel is spilled, immediately wipe clean and flush with soapy water to avoid permanent damage.
- When using BDF, you are advised to keep a full tank of the fuel, especially overnight and during short term storage, to reduce condensation within the tank. Be sure to tighten the fuel cap after refueling to prevent moisture build up within the tank. Water in the biodiesel mixture will damage the fuel filters and may damage the engine components.

Maintenance requirements when using BDF B0 through B5

Extended oil-change-intervals may result in premature wear or engine damage.

Maintenance requirements when using BDF B6 through B20

The maintenance interval for fuel related parts changes.
See the following table for the new maintenance interval.

<table>
<thead>
<tr>
<th>Items</th>
<th>Interval</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fuel filter</td>
<td>Check</td>
<td>Every 50 hr</td>
</tr>
<tr>

</tr>
<tr>
<td>Fuel hose</td>
<td>Check</td>
<td>Every 6 months</td>
</tr>
<tr>
<td></td>
<td>Replace</td>
<td>Every 2 years</td>
</tr>
</tbody>
</table>

**Long term storage for B5**
- BDF easily deteriorates due to oxygen, water, heat, and foreign substances. Do not store B5 longer than three months.
- When using B5 fuel and storing the machine longer than three months, drain the fuel from the tanks and replace with light-mineral-oil-diesel-fuel. Subsequently, operate the engine at least the following minutes to remove all of the biodiesel from the fuel lines.

| Operating the engine | 30 minutes |

**Long term storage for B6 through B20**
- BDF easily deteriorates due to oxygen, water, heat, and foreign substances. Do not store B6 through B20 longer than one month.
- When using B6 through B20 fuel and storing the machine longer than one month, drain the fuel from the tanks and replace with light-mineral-oil-diesel-fuel. Subsequently, operate the engine at least the following minutes to remove all of the biodiesel from the fuel lines.

| Operating the engine | 30 minutes |

## IMPORTANT
- You must do the jobs indicated by ◎ after the first 50 hours of operation.
- The items which is @ marked are registered as the emission related critical parts by KUBOTA in the U.S.EPA nonroad emission regulation. As the engine owner, you are responsible for the performance of the required maintenance on the engine according to the preceding instruction.
  Please see Warranty Statement in detail.

*1 The initial 50 hours should not be a replacement (changing) cycle.
*2 When the battery is used for less than 100 hours per year, check the battery condition by reading the indicator annually.
*3 You should clean the air cleaner more often in dusty conditions than in normal conditions.
*4 Every 1,000 hours or every 1 year whichever comes faster.
*5 Every 2,000 hours or every 2 years whichever comes faster.
*R Replace if any deterioration (crack, hardening, scar, or deformation) or damage occurred.

- The jobs indicated by ◎ must be done after the first 50 hours of operation.

*1 Replace the gear box oil seal if any deterioration (crack, hardening, scar, or deformation) or damage occurred.
CHECK AND MAINTENANCE

1. Periodic service

**WARNING**
To avoid serious injury or death:
- Do not work under any hydraulically supported devices. Working under any hydraulically supported devices can settle, suddenly leak down, or be accidentally lowered.
- If necessary to work under the tractor or any machine elements for servicing or adjustment, securely support the tractor or any machine elements with stands or suitable blocking beforehand.

1.1 Opening bonnet

**WARNING**
- Never open the bonnet while the engine operates.
- Do not touch the muffler or the exhaust pipes while they are hot. Touching the hot muffler or exhaust pipes could cause severe burns.

1. Pull the guard forward.
2. Pull the bonnet open lever to release the latch to open the bonnet, and open the bonnet.

1.2 Daily check

**WARNING**
- To avoid serious injury or death:

Take the following precautions when checking the tractor.
- Park the machine on firm and level ground.
- Set the parking brake.
- Lower the implement to the ground.
- Release all residual pressure of the hydraulic system.
- Stop the engine and remove the key.

For your own safety and maximum service life of the machine, make a thorough daily inspection before operating the machine or starting the engine.

1.2.1 Walk around inspection

Look around and under the tractor for such items as loose bolts, trash build-up, oil or coolant leaks, or broken or worn parts.

1.2.2 Checking fuel gauge and refueling

**WARNING**
To avoid serious injury or death:
- Do not smoke while refueling.
- Be sure to stop the engine and remove the key before refueling.

To avoid allergic skin reaction:
- Wash hands immediately after contact with diesel fuel.

**IMPORTANT**
- Do not permit dirt, trash, or water to get into the fuel system.
- Be careful not to empty the fuel tank, otherwise air will enter the fuel system, necessitating bleeding before next starting the engine.
- Be careful not to spill the fuel during refueling. If you should spill, wipe it off at once, or it may cause a fire.
- To prevent water condensation and water accumulation in the fuel tank, fill the tank before parking overnight.

Using fuel

<table>
<thead>
<tr>
<th>Temperature</th>
<th>fuel</th>
</tr>
</thead>
<tbody>
<tr>
<td>Above -10 °C (14 °F)</td>
<td>Grade No. 2-Diesel fuel</td>
</tr>
<tr>
<td>Below -10 °C (14 °F)</td>
<td>Grade No. 1-Diesel fuel</td>
</tr>
</tbody>
</table>

1. Turn the key switch to the **ON** position and check the amount of fuel by the fuel gauge.
2. Fill the fuel tank with fuel when the fuel gauge shows as follows.

<table>
<thead>
<tr>
<th>Amount of fuel for refueling</th>
<th>1/4 or less in the fuel tank</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fuel tank</td>
<td>Capacity</td>
</tr>
<tr>
<td></td>
<td>25 L</td>
</tr>
<tr>
<td></td>
<td>6.6 U.S.gals.</td>
</tr>
</tbody>
</table>

2. Check the engine oil before starting the engine, or, after five minutes or more when the engine has been stopped.
3. To check the engine oil level, draw out the dipstick, wipe it clean, replace it, and draw it out again.
4. Check to see that the engine oil level lies between the two notches.
5. If the engine oil level is too low, add new oil to the prescribed level at the oil inlet.

1.2.3 Checking engine oil level

**WARNING**

To avoid serious injury or death:
- Be sure to stop the engine before checking the engine oil level.

**IMPORTANT**

- When using an engine oil of different maker or viscosity from the previous one, remove all of the old oil and oil filter. Never mix two different types of oil.
- If the engine oil level is low, do not operate the engine.
- When using the BT603 Backhoe and checking oil level, locate the tractor, the loader, and the backhoe on a flat surface and set the loader and the backhoe as illustrated as follows.

1. Park the machine on a firm, flat, and level surface.

1.2.4 Checking transmission fluid level

**WARNING**

To avoid serious injury or death:
- Park the tractor on a firm, flat, and level surface, lower the implement to the ground, and stop the engine.

**IMPORTANT**

- If the transmission fluid level is low, do not operate the engine.

1. To check the transmission fluid level, check the dipstick as the following procedure.
   a. Draw out the dipstick.
   b. Wipe the dipstick clean.
   c. Replace the dipstick.
   d. Draw the dipstick out again.
2. Check to see that the transmission fluid level lies between the two notches.
3. If the transmission fluid level is too low, add new fluid to the prescribed level at the oil inlet.

(1) Oil inlet
(2) Dipstick

(A) Transmission fluid level is acceptable within this range.

1.2.5 Checking coolant level

**WARNING**
To avoid serious injury or death:
- Be sure to stop the engine and remove the key before checking coolant level.
- Do not remove the radiator cap while the coolant is hot. When coolant is cool, slowly rotate the radiator cap to the first stop and allow sufficient time for excess pressure to escape before removing the radiator cap completely.

**IMPORTANT**
- If the radiator cap has to be removed, follow the preceding warning and securely retighten the radiator cap.
- Use clean, fresh, soft water and anti-freeze to fill the recovery tank.

1. Check to see that the coolant level is between the "H" and "L" marks of the recovery tank.
2. When the coolant level drops due to evaporation, add soft water only. In case of leakage, add antifreeze and soft water in the specified mixing ratio up to the "H" level.

**WARNING**
To avoid serious injury or death:
- Be sure to stop the engine and remove the key before removing the screen.
- Before checking or cleaning the panel, wait long enough until it cools down.

**IMPORTANT**
- The panel and the radiator screen must be clean from debris to prevent the engine from overheating and to allow good air intake for the air cleaner.
- Be sure to reinstall the panel on the pillar completely to prevent the invasion of dust.
- Be sure to stop the engine to avoid personal injury and to allow good air intake for air cleaner.

1. Check the panel and the radiator screen to be sure that they are clean from debris.
2. Remove the radiator screen, and then remove all the foreign material.

**NOTE**
- If the dust or chaff is accumulated in the battery compartment, open the panel and clean completely.

1.2.7 Checking brake pedal
1. Inspect the brake pedal for free travel, and smooth operation.
2. Adjust the brake pedal if incorrect measurement is found.

1.2.8 Checking gauges, meters, and Easy Checker™
1. Inspect the instrument panel for broken gauge(s), meter(s) and Easy Checker™ lamps.
2. Replace the gauge(s), the meter(s), or the Easy Checker™ if they are broken.

1.2.9 Checking head light, hazard light, and tail light
1. Inspect the lights for broken bulbs and lenses.

2. Replace the lights if they are broken.

1.2.10 Checking seat belt and ROPS
1. Always check condition of the seat belt and the ROPS attaching hardware before operating the tractor.
2. Replace the seat belt or the ROPS if it is damaged.

1.2.11 Checking and cleaning electrical wiring and battery cables

**WARNING**
To avoid serious injury or death:
- A loosened terminal or connector, or damaged wire may affect the performance of the electrical components or cause short circuits. Leakage of electricity could result in a fire hazard, a dead battery, or damage to the electrical components.
- Replace the damaged wires or connections promptly.
- If a fuse blows soon after replacement, do not use the capacity larger than recommended or bypass the fuse system.
- Many wiring connections are protected by waterproof plugs. Plug and unplug these connections carefully and make sure that they are sealed correctly after assembly.
- Accumulation of dust, chaff, and deposits of spilled fuel around the battery, electrical wiring, engine, or exhaust system may cause fire hazards.
  Clean around the battery, electrical wiring, engine or exhaust system before starting to work.
- To avoid premature electrical malfunctions, do not apply high pressure water directly to the battery, the wiring, the connectors, the electrical components, or the instrument panel.

- Inspect the following check items regularly.
  - Check the wiring for chafed or cracked insulation.
  - Check the wiring harness clamps. Replace them if necessary.
  - Check the connectors and the terminals for looseness, contamination, or overheated or discolored connections.
  - Check the instrument panel for correct operation of the switches and the gauges.
1.2.12 Checking movable parts

1. If any of the movable parts, such as levers and pedals, is not smoothly moved because of rust or sticky material, remove the rust or the sticky material, and apply oil or grease on the relevant spot.
Do not force the movable parts into motion. Otherwise, the machine may get damaged.

1.3 Check points of initial 50 hours
1.3.1 Changing engine oil

**WARNING**
To avoid serious injury or death:
- Be sure to stop the engine and remove the key before changing the oil.
- Oil can be hot and can burn. Allow the engine to cool down sufficiently.

<table>
<thead>
<tr>
<th>Engine oil with filter</th>
<th>Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>3.3 L</td>
</tr>
<tr>
<td></td>
<td>3.49 U.S.qts.</td>
</tr>
</tbody>
</table>

1. To drain the used engine oil, remove the drain plug at the bottom of the engine, and drain the engine oil completely into the oil pan.
2. After draining of the used engine oil, reinstall the drain plug.
3. Fill the engine with the new engine oil up to the upper notch on the dipstick.
4. Properly dispose of the used engine oil.

**1.3.2 Replacing engine oil filter**

**WARNING**
To avoid serious injury or death:
- Be sure to stop the engine before replacing the oil filter cartridge.
- Oil can be hot and can burn. Allow the engine to cool down sufficiently.

**IMPORTANT**
- To prevent serious damage to the engine, use only a KUBOTA genuine filter.

1. Remove the oil filter.
2. Put a film of the clean engine oil on the rubber seal of the new filter.
3. Tighten the filter quickly until it contacts the mounting surface.
4. Tighten filter by hand an additional 1/2 turn only.
5. After the new filter has been replaced, the engine oil normally decreases a little. Make sure that the engine oil does not leak through the seal and be sure to check the oil level on the dipstick.
6. Fill the engine with the engine oil up to the prescribed level.
1.3.3 Replacing transmission oil filter

**WARNING**
To avoid serious injury or death:
- Be sure to stop the engine before changing the transmission oil filter cartridge.
- Oil can be hot and can burn. Allow the engine to cool down sufficiently.

**IMPORTANT**
- To prevent serious damage to the hydraulic system, use only a KUBOTA genuine filter.

1. Remove the transmission oil filter.
2. Put a film of clean transmission oil on rubber seal of new transmission oil filter.
3. Tighten the transmission oil filter quickly until it contacts the mounting surface.
4. Tighten the transmission oil filter by hand an additional 1/2 turn only.
5. After the new transmission oil filter has been replaced, the transmission fluid level will decrease a little. Make sure that the transmission fluid does not leak through the seal, and check the fluid level.
6. Check the dipstick and refill with oil to prescribed level.
7. Properly dispose of used oil.

1.3.4 Changing transmission fluid

**WARNING**
To avoid serious injury or death:
- Oil can be hot and can burn. Allow the engine to cool down sufficiently.

1. To drain the used transmission fluid, remove the drain plug at the bottom of the transmission case and drain the transmission fluid completely into the oil pan.
2. After draining the transmission fluid, reinstall the drain plug.
3. Clean the transmission strainer.
4. Fill with new transmission fluid up to the upper notch on the dipstick.

5. After operating the engine for a few minutes, stop it and check the transmission fluid level again.

6. If the transmission fluid level is lower than the prescribed level shown on the dipstick (3), add fluid to the prescribed level.

7. Properly dispose of used transmission fluid.

**IMPORTANT**
- Do not operate the tractor immediately after changing the transmission fluid.
  Operate the engine at medium speed for a few minutes to prevent damage to the transmission.

--- RELATED PAGE ---
LUBRICANTS, FUEL AND COOLANT on page 2-7

**1.3.5 Cleaning transmission strainer**

1. When changing the transmission fluid, disassemble and rinse the transmission strainer with nonflammable solvent to completely clean off filings. When reassembling the transmission strainer, be careful not to damage the parts.

**NOTE**
- Since the fine filings in the oil can damage the precision component parts of the hydraulic system, the end of the suction line is provided with an oil strainer.

**1.4 Check points of every 50 hours**

**1.4.1 Greasing**

**NOTE**
- If the machine is operated in extremely wet and muddy conditions, lubricate grease fittings more often.
1. Apply a small amount of multipurpose grease to the following points

1BXMCO0071A01

1BXMCO00107A03

(1) Speed control pedal
(2) Battery terminals
(3) Bonnet lock
(4) Bonnet guide rod

1BXMCO00070A01

2. GENERAL

CHECK AND MAINTENANCE

1. Periodic service
1.4.2 Checking engine start system

**WARNING**
To avoid serious injury or death:
- Do not allow anyone near the tractor while testing.
- If the tractor does not pass the test, do not operate the tractor.

Preparation before testing
1. Sit on the operator's seat.
2. Set the parking brake and stop the engine.
3. Shift the range gear shift lever to the neutral position.
4. Check whether the speed control pedal is in the neutral position.
5. **Shift the PTO clutch lever to the off position.**

[Test 1] Switch for the speed control pedal
1. Make sure that the range gear shift lever is set in the neutral position.
2. Depress the speed control pedal.
3. Turn the key to the start position.

The engine must not crank.

[Test 2] Switch for the PTO clutch lever
1. Make sure that the range gear shift lever is set in the neutral position.
2. Make sure that the speed control pedal is set in the neutral position.
3. **Shift the PTO clutch lever to the on position.**
4. Turn the key to the start position.

The engine must not crank.

1.4.3 Checking operator presence control (OPC) system

**WARNING**
To avoid serious injury or death:
- Do not allow anyone near the tractor while testing.
- If the tractor does not pass the test, do not operate the tractor.

Preparation before testing
1. Sit on the operator's seat.
2. Set the parking brake and stop the engine.
3. Shift the range gear shift lever to the neutral position.
4. Check whether the speed control pedal is in the neutral position.
5. **Shift the PTO clutch lever to the off position.**

[Test 1] Switches for the operator's seat and the speed control pedal
1. Start the engine.
2. Depress the speed control pedal.
3. Stand up.
   - Do not get off the machine.
   - The engine must stop after approximately one second.

[Test 2] Switches for the operator's seat and the PTO clutch lever
1. Start the engine.
2. Engage the PTO clutch lever.
3. Stand up.
Do not get off the machine.
The engine must stop after approximately one second.

1.4.4 Checking wheel bolt torque

**WARNING**
To avoid serious injury or death:
- Never operate the tractor with a loose rim, wheel, or axle.
- Any time bolts are loosened, retighten to the specified torque.
- Check all bolts frequently and keep them tight.

1. Check the wheel bolts regularly especially when new.
2. If they are loose, tighten them as follows.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Front wheel bolt</th>
<th>149.2 to 179.0 N-m</th>
<th>15.2 to 18.3 kgf-m</th>
<th>110 to 132 lbf-ft</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rear wheel bolt</td>
<td>108.5 to 130.2 N-m</td>
<td>11.1 to 13.3 kgf-m</td>
<td>80 to 96 lbf-ft</td>
<td></td>
</tr>
</tbody>
</table>

1.4.5 Cleaning lock lever shaft

1. Before you use the lock lever, clean the lever movable area (1).

**DANGER**
To avoid the possibility of battery explosion:
For the refillable type battery, follow the instructions below.
- Do not use or charge the refillable type battery if the fluid level is below the “LOWER” (lower limit level) mark. Otherwise, the battery component parts may prematurely deteriorate, which may shorten the battery’s service life or cause an explosion.

1.5 Check points of every 100 hours
1.5.1 Checking battery condition
• Check the fluid level regularly and add distilled water as required so that the fluid level is between the “UPPER” and “LOWER” levels.

⚠️ DANGER
To avoid serious injury or death:
• When the battery is being activated, hydrogen and oxygen gases in the battery are extremely explosive. Keep open sparks and flames away from the battery at all times, especially when charging the battery.

⚠️ WARNING
To avoid serious injury or death:
• Batteries, battery posts, terminals and related accessories contain lead and lead compounds, and other chemicals known to the State of California to cause cancer and birth problems or other reproductive harm. Wash hands after handling.
• Never remove the battery cap while the engine operates.
• Keep electrolyte away from eyes, hands and clothes. If you are spattered with it, wash it away completely with water immediately and get medical attention.
• Keep open sparks and flames away from the battery at all times. Hydrogen gas mixed with oxygen becomes very explosive.
• Wear eye protection and rubber gloves when working around battery.

■ IMPORTANT
• The factory-installed battery is of non-refillable type. If the battery is weak, charge the battery or replace it with new one.
• Mishandling the battery shortens the service life and adds to maintenance costs. The original battery is maintenance free, but needs some servicing. If the battery is weak, the engine will be difficult to start and the lights will be dim. It is important to check the battery periodically.
• When exchanging an old battery for new one, use battery of equal specification in table below.

<table>
<thead>
<tr>
<th>Battery type</th>
<th>Volts</th>
<th>Reserve capacity</th>
<th>Cold cranking amps</th>
<th>Normal charging rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>526RMF</td>
<td>12 V</td>
<td>86 min.</td>
<td>560</td>
<td>8.6 A</td>
</tr>
</tbody>
</table>

Maintenance-free, non-accessible batteries are designed to eliminate the need to add water. Yet the volume of electrolyte above plates may eventually become depleted due to abnormal conditions such as high heat or improper regulator setting. Use a voltmeter to check the state of charge. See reference chart below to determine if charging is necessary.

<table>
<thead>
<tr>
<th>Battery voltage</th>
<th>Reference state of charge</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.6 V</td>
<td>100% (Full charge)</td>
</tr>
<tr>
<td>12.4 V</td>
<td>75%</td>
</tr>
<tr>
<td>12.2 V</td>
<td>50%</td>
</tr>
<tr>
<td>12.0 V</td>
<td>25%</td>
</tr>
<tr>
<td>11.8 V</td>
<td>0%</td>
</tr>
</tbody>
</table>

Battery charging

⚠️ DANGER
To avoid serious injury or death:
• When the battery is being activated, hydrogen and oxygen gases in the battery are extremely explosive. Keep open sparks and flames away from the battery at all times, especially when charging the battery.

⚠️ WARNING
To avoid serious injury or death:
• When disconnecting the cable from the battery, start with the negative terminal first. When connecting the cable to the battery, start with the positive terminal first.
• Never check battery charge by placing a metal object across the posts. Use a voltmeter or hydrometer.

1. To slow charge the battery, connect the battery positive terminal to the charger positive terminal and the negative to the negative, then charge for at least 1 hour at 6.5 amperes.
2. A boost charge is only for emergencies. It will partially charge the battery at a high rate and in a short time. When using a boost-charged battery, it is necessary to recharge the battery as early as possible
possible. Failure to do this will shorten the battery's service life.

3. When the specific gravity of electrolyte is between 1.27 and 1.29 the charging is completed.

**Battery for storage**

1. When storing the machine for a long period, remove the battery from the machine, adjust the electrolyte to the proper level and store in a dry place out of direct sunlight.

2. The battery self-discharges while it is stored. Recharge it once every 3 months in hot seasons and once every 6 months in cold seasons.

### 1.5.2 Cleaning air cleaner element

**WARNING**

To avoid serious injury or death:
* Be sure to stop the engine and remove the key before cleaning the air cleaner element.

**IMPORTANT**

- The air cleaner uses a dry element. Never apply oil to the air cleaner.
- Do not operate the engine with the filter element removed.
- Align the arrow marks when reinstalling the cover. If the cover is improperly fitted, dust passes by the baffle and directly adheres to the air cleaner element.

**NOTE**

- Check to see if the evacuator valve is blocked with dust.
- Open the evacuator valve once a week under ordinary conditions or daily when used in a dusty place to get rid of large particles of dust and dirt.

**Cleaning dust from the air cleaner element**

1. Remove the air cleaner cover and the element.
2. When dry dust adheres to the element, blow compressed air from the inside, turning the element. Pressure of compressed air must be below 205 kPa (2.1 kgf/cm², 30 psi).

**Cleaning carbon or oil from the air cleaner element**

1. Remove the air cleaner cover and the element.
2. Soak the air cleaner element in detergent for 15 minutes.
3. Then wash it several times in water.
4. Rinse the air cleaner element with clean water.
5. Dry the air cleaner element naturally.
6. After the air cleaner element is fully dried, inspect inside of it with a light and check if it is damaged or not.

Refer to the instructions on the label attached to the case.

### 1.5.3 Checking fuel filter

**WARNING**

To avoid serious injury or death:
* Stop the engine and remove the key before checking the fuel lines and the fuel filter.
* Check the fuel lines periodically. The fuel lines are subject to wear and aging. Fuel may leak out onto the running engine, causing a fire.

**IMPORTANT**

- When the fuel line is disconnected for maintenance or repair, plug both ends of the fuel line with a clean plug of suitable size to prevent dust and dirt from entering. You must take particular care of the fuel filter in order to avoid dust and dirt getting into the fuel system. Entrance of dust and dirt causes malfunction of the fuel pump.

The fuel line is made of rubber and ages regardless of service period.

1. Inspect the fuel filter.
2. After inspection of the fuel filter, if the fuel line and clamps are found damaged or deteriorated, replace them.
3. Check the fuel filter. If the fuel filter is clogged by debris or contaminated by water, replace it.

![Diagram of fuel system components]

(1) Pipe clamps (2) Fuel line (3) Fuel filter (4) Fuel pump

**NOTE**
- If the fuel line is removed, be sure to properly bleed the fuel system.

### 1.5.4 Adjusting fan belt tension

**WARNING**
- To avoid serious injury or death:
  - Be sure to stop the engine and remove the key before checking the fan belt tension.

1. Stop the engine and remove the key.
2. Apply moderate thumb pressure to belt between pulleys.

<table>
<thead>
<tr>
<th>Fan belt tension</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>A deflection of between 7 to 9 mm (0.28 to 0.35 in.) when the belt is pressed in the middle of the span.</td>
<td></td>
</tr>
</tbody>
</table>

3. If tension is incorrect, loosen the alternator mounting bolts and, using a lever placed between the alternator and the engine block, pull the alternator out until the deflection of the belt falls within acceptable limits.

![Diagram of alternator and belt tension]

(1) Bolt (A) Check the belt tension.

4. Replace fan belt if it is damaged.

### 1.5.5 Adjusting HST neutral spring

**WARNING**
- Do not operate if tractor moves on level ground with foot off speed control pedal.
- If tractor moves on level ground with foot off the pedal, or, if the pedal is too slow in returning to neutral position when removing the foot from the pedal, adjust the HST neutral spring.

The HST neutral spring located under the front right side of the fender can adjust returning speed of speed control pedal. Since the HST neutral spring tension is weakened, the HST tension should be checked and adjusted every 100 hours.

**Checking the HST neutral spring tension: Dynamic braking**

1. Start the engine and hold the maximum engine speeds.
2. Operate the machine on the concrete level ground.
3. Shift the range gear shift lever to hi position.
4. Depress the speed control pedal to forward.
5. Release the foot from the speed control pedal.
6. Check the distance between the foot releasing point (A) and the machine stopping point (B). If distance (L) is more than approximately 3 m (10 ft.), strengthen the HST neutral spring tension so that the machine will stop in approximately 3 m (10 ft.) after releasing the foot from the speed control pedal.
Adjusting the HST neutral spring tension: Dynamic braking
1. Remove the step from the machine.
2. Loosen the lock nut (2).
3. Adjust the adjusting nut (3) on the adjusting rod (4).
4. Tighten the lock nut (2).
5. Start the engine and check dynamic brake as mentioned former.
6. If the machine will not stop with dynamic brake in approximately 3 m (10 ft.), adjust the neutral spring again.

<table>
<thead>
<tr>
<th>Length (M)</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 mm</td>
<td>0.39 in.</td>
</tr>
</tbody>
</table>

1.5.6 Adjusting brake pedal

**WARNING**
To avoid serious injury or death:
- Stop the engine, remove the key, lower the implement to the ground, and chock the wheels before checking the brake pedal.

1. Release the parking brake.
2. Loosen the lock nut and turn the turnbuckle to adjust the rod length so that the brake free travel is 10 mm (0.4 in.).
3. Extend the turnbuckle one additional turn.
4. Retighten the lock nut.
5. Depress the brake pedal several times and make sure that free travel is inside factory specification.

<table>
<thead>
<tr>
<th>Brake pedal free travel</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>25 to 35 mm</td>
<td>1.0 to 1.4 in.</td>
</tr>
</tbody>
</table>

1.6 Check point of every 200 hours
1.6.1 Replacing engine oil filter

**WARNING**
To avoid serious injury or death:
- Be sure to stop the engine before replacing the oil filter cartridge.
- Oil can be hot and can burn. Allow the engine to cool down sufficiently.
**IMPORTANT**
- To prevent serious damage to the engine, use only a KUBOTA genuine filter.

1. Remove the oil filter.
2. Put a film of the clean engine oil on the rubber seal of the new filter.
3. Tighten the filter quickly until it contacts the mounting surface.
4. Tighten filter by hand an additional 1/2 turn only.
5. After the new filter has been replaced, the engine oil normally decreases a little. Make sure that the engine oil does not leak through the seal and be sure to check the oil level on the dipstick.
6. Fill the engine with the engine oil up to the prescribed level.
7. Properly dispose of the used engine oil.

### 1.6.2 Changing engine oil

**WARNING**
- To avoid serious injury or death:
  - Be sure to stop the engine before changing the oil.
  - Oil can be hot and can burn. Allow the engine to cool down sufficiently.

<table>
<thead>
<tr>
<th>Engine oil with filter</th>
<th>Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>3.3 L</td>
</tr>
<tr>
<td></td>
<td>3.49 U.S.qts.</td>
</tr>
</tbody>
</table>

1. To drain the used engine oil, remove the drain plug at the bottom of the engine, and drain the engine oil completely into the oil pan.
2. After draining of the used engine oil, reinstall the drain plug.
3. Fill the engine with the new engine oil up to the upper notch on the dipstick.
4. Properly dispose of the used engine oil.

### 1.6.3 Replacing transmission oil filter

**WARNING**
- To avoid serious injury or death:
  - Be sure to stop the engine before changing the transmission oil filter cartridge.
  - Oil can be hot and can burn. Allow the engine to cool down sufficiently.

**IMPORTANT**
- To prevent serious damage to the hydraulic system, use only a KUBOTA genuine filter.

1. Remove the transmission oil filter.
2. Put a film of clean transmission oil on rubber seal of new transmission oil filter.
3. Tighten the transmission oil filter quickly until it contacts the mounting surface.
4. Tighten the transmission oil filter by hand an additional 1/2 turn only.
5. After the new transmission oil filter has been replaced, the transmission fluid level will decrease a little. Make sure that the transmission fluid does not leak through the seal, and check the fluid level.
6. Check the dipstick and refill with oil to prescribed level.
7. Properly dispose of used oil.

1.6.4 Adjusting toe-in

**WARNING**
To avoid serious injury or death:
- Park the tractor on a firm, flat, and level place.
- Lower the implement to the ground, and apply the parking brake.
- Stop the engine and remove the key.

Checking toe-in
1. Turn the steering wheel so that the front wheels are in the straight ahead position.
2. Measure the distance between the tire beads at front of the tires, and at the hub heights.
3. Measure the distance between the tire beads at rear of the tires, and at the hub heights.
4. Front distance should be 0 to 5.0 mm (0 to 0.2 in.) less than rear distance. If front distance is not proper length, adjust the length of the tie rod.

<table>
<thead>
<tr>
<th>Toe-in ((B) — (A))</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 to 5.0 mm</td>
<td>0 to 0.2 in.</td>
</tr>
</tbody>
</table>

1.7 Check points of every 400 hours

1.7.1 Adjusting front axle pivot

**WARNING**
To avoid serious injury or death:
- Be sure to stop the engine and remove the key before adjusting the front axle pivot.

If the front axle pivot pin adjustment is not correct, front wheel vibration can occur causing vibration in the steering wheel.

1. Remove the split pin and tighten the adjusting nut.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Adjusting nut</th>
</tr>
</thead>
<tbody>
<tr>
<td>20 N·m</td>
<td>2.0 kgf m</td>
</tr>
<tr>
<td>15 lbf·ft</td>
<td></td>
</tr>
</tbody>
</table>

2. Make sure that one of the nut slots aligns with the split pin hole.
3. Tighten the nut slightly if necessary when aligning the nut slots with the split pin hole.
4. Replace the split pin.

1.7.2 Changing transmission fluid

**WARNING**
To avoid serious injury or death:
- Oil can be hot and can burn. Allow the engine to cool down sufficiently.

1. To drain the used transmission fluid, remove the drain plug at the bottom of the transmission case and drain the transmission fluid completely into the oil pan.
2. After draining the transmission fluid, reinstall the drain plug.
3. Clean the transmission strainer.
4. Fill with new transmission fluid up to the upper notch on the dipstick.
5. After operating the engine for a few minutes, stop it and check the transmission fluid level again.
6. If the transmission fluid level is lower than the prescribed level shown on the dipstick (3), add fluid to the prescribed level.
7. Properly dispose of used transmission fluid.

**IMPORTANT**
- Do not operate the tractor immediately after changing the transmission fluid.
  Operate the engine at medium speed for a few minutes to prevent damage to the transmission.

---

**LUBRICANTS, FUEL AND COOLANT on page 2-7**
1.7.3 Cleaning transmission strainer

1. When changing the transmission fluid, disassemble and rinse the transmission strainer with nonflammable solvent to completely clean off filings. When reassembling the transmission strainer, be careful not to damage the parts.

**NOTE**
- Since the fine filings in the oil can damage the precision component parts of the hydraulic system, the end of the suction line is provided with an oil strainer.

1.7.4 Changing front axle case oil

**WARNING**
To avoid serious injury or death:
- Be sure to stop the engine and remove the key before changing the front axle case oil.

1. Park the tractor on a firm, flat, and level place.
2. To drain the used front-axle-case-oil, remove the right and left drain plugs and oil gauge at the front axle case.

1. Drain the front-axle-case-oil completely into the oil pan.
2. After draining the front-axle-case-oil, reinstall the drain plugs.
3. Remove the right and left breather plugs.
4. Fill with new front-axle-case-oil up to the upper notch on the dipstick.

<table>
<thead>
<tr>
<th>Front axle case oil</th>

<td>4.7 L</td>
</tr>
<tr>
<td></td>
<td>5.0 U.S.qts</td>
</tr>
<tr>
<td></td>
<td>4.1 Imp.qts</td>
</tr>
</tbody>
</table>

**IMPORTANT**
- After 10 minutes, check the front-axle-case-oil level again. If the front-axle-case-oil level is lower than the prescribed level, add the front-axle-case-oil to prescribed level.

7. After filling with front-axle-case-oil, reinstall the oil gauge and breather plugs.

**RELATED PAGE**
LUBRICANTS, FUEL AND COOLANT on page 2-7

1.7.5 Replacing fuel filter element

**NOTE**
- If the fuel line is removed, be sure to properly bleed the fuel system.

1. Disconnect the fuel hoses and replace the fuel filter (2).
2. Disconnect the fuel hoses and loosen the pipe clamp to replace the fuel filter (5).

1.8 Check points of every 800 hours
1.8.1 Adjusting engine valve clearance
• See “Checking engine valve clearance”.

1.9 Check points of every 1000 hours or 1 year
Be sure to do the following servicing once every 1000 hours or yearly, whichever comes first.

1.9.1 Replacing air cleaner element
See “Cleaning air cleaner element”.

1.10 Check points of every 1500 hours
1.10.1 Checking injection pressure of fuel injection nozzle
• See “Checking fuel injection pressure”.

1.11 Check points of every 2000 hours or 2 years
1.11.1 Flushing cooling system and changing coolant

**WARNING**
To avoid serious injury or death:
• Do not remove the radiator cap while the coolant is hot. When the coolant is cool, slowly rotate the radiator cap to the first stop and allow sufficient time for excess pressure to escape before removing the radiator cap completely.

**IMPORTANT**
• Do not start the engine without coolant.
• Use clean, fresh soft water and the anti-freeze to fill the radiator and the recovery tank.
• When mixing the anti-freeze with water, the anti-freeze mixing ratio is 50%.
• Securely tighten the radiator cap. If the radiator cap is loose or improperly fitted, water may leak out and the engine could overheat.

<table>
<thead>
<tr>
<th>Coolant (with recovery tank)</th>
<th>Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>3.1 L</td>
</tr>
<tr>
<td></td>
<td>3.3 U.S.qts</td>
</tr>
<tr>
<td></td>
<td>2.7 Imp.qts</td>
</tr>
</tbody>
</table>

1. Stop the engine and let it cool down.
2. To drain the coolant, open the radiator drain plug or the engine drain plug and remove the radiator cap. The radiator cap must be removed to completely drain the coolant.
3. After all coolant is drained, close the drain plug.
4. Fill the radiator with clean soft water and the cooling system cleaner.
5. Follow directions of the instruction of cooling system cleaner.
6. After flushing the radiator, fill it with clean soft water and the anti-freeze until the coolant level is just below the radiator cap.
7. Install the radiator cap securely.
8. Fill the recovery tank with coolant up to the “H” mark on the recovery tank.
9. Start and operate the engine for a few minutes.
10. Stop the engine and let it cool.
11. Check the coolant level of the recovery tank and add the coolant if necessary.

When using the antifreeze, put on some protection such as rubber gloves. The antifreeze contains poison.

If someone drank antifreeze, seek immediate medical help. Do not make a person throw up unless told to throw up by poison-control center or a health care professional. Use standard first aid and CPR for signs of shock or cardiac arrest. Call your local poison control center or your local emergency number for further assistance.

When the antifreeze comes in contact with the skin or clothing, wash it off immediately.

Do not mix different types of the antifreeze. The mixture can produce chemical reaction causing harmful substances.

The antifreeze is extremely flammable and explosive under certain conditions. Keep fire and children away from the antifreeze.

When draining fluids from the engine, place some container underneath the engine body.

Do not pour waste onto the ground, down a drain, or into any water source.

Also, follow the relevant environmental protection regulations when disposing of the antifreeze.

Always use a 50/50 mix of long-life coolant and clean soft water in KUBOTA engines.

■ NOTE

- The following data represent industry standards that necessitate a minimum glycol content in the concentrated antifreeze.

- Long-life coolant (hereafter LLC) comes in several types. Use ethylene glycol (EG) type for this engine.

- Before using LLC-mixed cooling water, fill the radiator with fresh water and empty it again. Repeat this procedure two times or three times to clean up the inside.

- Mixing the LLC

<table>
<thead>
<tr>
<th>Premix</th>
<th>50% LLC with 50% clean soft water.</th>
</tr>
</thead>
</table>

When mixing, stir it up well, and then fill into the radiator.

- Adding the LLC.
  - Add only water if the mixture reduces in amount by evaporation.
  - If there is a mixture leak, add the LLC of the same manufacturer and type in the same mixture percentage.

■ IMPORTANT

- Never add any long-life coolant of different manufacturer. Different brands may have different additive components,
and the engine may fail to perform as specified.

- When the LLC is mixed, do not use any radiator cleaning agent. The LLC contains anticorrosive agent. If mixed with the cleaning agent, sludge may build up, adversely affecting the engine parts.
- KUBOTA's genuine long-life coolant has a service life of two years. Be sure to change the coolant every two years.
- The procedure for the mixing of water and the antifreeze differs according to the make of the antifreeze and the ambient temperature. Refer to SAE J1034 standard, more specifically also to SAE J814c.

| Antifreeze | Freezing point | Boiling point
<table>
<thead>
<tr>
<th></th>
<th></th>

</tr>
</tbody>
</table>

*1 At 1.013 × 10^5 Pa (760 mmHg) atmospheric pressure. A higher boiling point is obtained by using a radiator pressure cap which permits the development of pressure within the cooling system.

1.12 Check points of every 3000 hours

1.12.1 Checking injection pump

- See “Fuel system” for checking injection pump.

--- RELATED PAGE ---

4. Fuel system on page 3-12

1.13 Check points of every 1 year

1.13.1 Checking intake air line

**WARNING**

To avoid serious injury or death:

- Stop the engine and remove the key before checking the intake air line.

1. Check to see that the hose and the hose clamps are tight and not damaged.
2. If the hose and the clamps are found worn or damaged, replace or repair them at once.

1.13.2 Checking radiator hoses and hose clamps

**WARNING**

To avoid serious injury or death:

- Be sure to stop the engine and remove the key before checking the radiator hose and the hose clamps.

1. If the hose clamps are loose or water leaks, tighten them securely.
2. Replace the radiator hoses and tighten the hose clamps securely if you checked and found that the radiator hoses are swollen, hardened, or cracked.
3. Properly dispose of used coolant.

1.13.3 Checking power steering line

**WARNING**

To avoid serious injury or death:

- Be sure to stop the engine and remove the key before checking the power steering line.

1. Check to see that all power steering lines are tight and not damaged.
2. If the power steering pressure hoses are found to be worn or damaged, replace or repair them at once.

1.13.4 Checking fuel lines

**WARNING**

To avoid serious injury or death:
- Stop the engine and remove the key before checking the fuel lines and fuel filter.
- Check the fuel lines periodically. The fuel lines are subject to wear and aging. Fuel may leak out onto the running engine, causing a fire.

**IMPORTANT**

- When the fuel line is disconnected for maintenance or repair, plug both ends of the fuel line with a clean plug of suitable size to prevent dust and dirt from entering. You must take particular care of the fuel lines in order to avoid dust and dirt getting into the fuel system. Entrance of dust and dirt causes malfunction of the fuel pump.

The fuel line is made of rubber and ages regardless of service period.

1. Inspect the fuel lines.
2. After inspection, if the fuel lines and clamps are found damaged or deteriorated, replace them.
3. Check the fuel filter. If the fuel filter is clogged by debris or contaminated by water, replace it.

**NOTE**

- If the fuel line is removed, be sure to properly bleed the fuel system.

1.13.5 Checking engine breather hose

1. Check the engine breather hose (1) for damage.
2. If the engine breather hose (1) is damaged, replace it with new one.
1.14 Check points of every 4 years

1.14.1 Replacing radiator hose
1. Replace the radiator hoses and tighten the hose clamps securely.

1.14.2 Replacing fuel hose
• See “Checking fuel lines”.

1.14.3 Replacing power steering hose
• See “Checking power steering line”.

1.14.4 Replacing intake air line
• See "Checking intake air line".

1.14.5 Replacing engine breather hose
• See “Checking engine breather hose”.

1.15 Service as required

1.15.1 Bleeding fuel system
Air must be removed:
• When the fuel filter or lines are removed.
• When the tank is completely empty.
• After the tractor has not been used for a long period of time.

Bleeding procedure
1. Fill the fuel tank with fuel.
2. Turn the key switch to the ON position for about 30 seconds.
   This allows the fuel pump (1) to work and pump air out of the fuel system.
3. Start the engine and operate for about 30 seconds, and then stop the engine.

1.15.2 Replacing fuse
The electrical system of the tractor is protected from potential damage by fuses.
A blown fuse indicates that there is an overload or short somewhere in the electrical system.
1. If any of the fuses should blow, replace with a new fuse with the same capacity.

**IMPORTANT**
- Before replacing a blown fuse, determine why the fuse blew and make any necessary repairs. Failure to follow this procedure may result in serious damage to the electrical system of the tractor.

**Head light**
1. Take the light bulb out of the body of the light and replace with a new one.

**Other lights**
1. Remove the lens and replace the light bulb.

---

2. Mower

2.1 Check points of daily or each use

2.1.1 Retightening mower blade screw

**NOTE**
- To avoid injury, always handle the mower blade with care.
1. Tilt up the mower and turn it over to expose the mower blades.
2. Wedge a wooden block (1) securely between the mower blade and mower deck.
3. Retighten the mower blade screw to the specified torque.

RCK54D-26BX and RCK60D-26BX

<table>
<thead>
<tr>
<th>Tightening torque Mower blade screw</th>

</tr>
</tbody>
</table>
|                                    | 75.9 to 86.8 lbf·ft

4. If the mower blade screw (2) is worn or broken, replace it.

### 2.1.2 Checking mower blade

**WARNING**
To avoid serious injury or death:
- Be sure to stop the engine and remove the key.
- Blades may be sharp. When you handle blades, wear heavy gloves or wrap end of blade with a rag.

**IMPORTANT**
- Use the proper metric size box or socket wrench to tighten or loosen the blade mounting bolt.

**NOTE**
- Before checking or replacing the blade, wipe grass and mud off the top and inside of the mower.
- Especially clean up the inside of the belt cover, because otherwise the belt life will be reduced.

1. The blade cutting edges must be kept sharp at all times. Sharpen the cutting edges, if they resemble blade (B). Replace the blades if they appear similar to blade (C).

### 2.1.3 Checking mower belt

1. Inspect the mower belt.
2. Replace the mower belt, if there is any damage found.

### 2.1.4 Checking gear box oil level

**IMPORTANT**
- Use the specified gear oil.
1. Place the mower on level ground.
2. Loosen the check plug (2), and check to see if oil seems from the opening.
3. If the oil level is low, remove the oil filler plug (3) and add new gear oil.

--- RELATED PAGE ---
LUBRICANTS, FUEL AND COOLANT on page 2-7

2.1.5 Greasing spindle shafts, belt tension pivot and tension pulley
1. Grease the grease fittings (1), (2), (3) if the amount of grease is insufficient.

[Only for RCK54D-26BX]
2. Remove the ramp bracket (5) for greasing spindle shafts. To remove the ramp bracket, remove the pin (6) and clevis pin (4) and slide the ramp bracket to the rear side (A). Then lift up (B) the ramp bracket to remove from mower deck.

2.1.6 Greasing front and rear anti-scalp rollers
1. Grease the grease fitting (1), (2) of the front and rear anti-scalp rollers if the amount of grease is insufficient.

2.1.7 Greasing universal joint
1. Grease the internal splines (1) and grease fittings (2) of the universal joint if the amount of grease is insufficient.
2. Grease between the hole and rod (3).

2.2 Check points of initial 50 hours

2.2.1 Changing gear box oil

**CAUTION**
- Be sure to stop the engine and remove the key before changing the oil.

**IMPORTANT**
- Use the specified gear oil.

1. Dismount the mower from the tractor, and place the mower on level ground.
2. Remove the oil filler plug (3).
3. Remove the drain plug (1), and drain the used oil completely.
4. After draining the used oil, reinstall the drain plug.
5. Fill with new oil up to the specified level.

---

### RELATED PAGE

**LUBRICANTS, FUEL AND COOLANT** on page 2-7

---

2.3 Check point of every 150 hours

2.3.1 Changing gear box oil

1. See “Changing gear box oil” in “Check points of initial 50 hours”.

---

### RELATED PAGE

2.2.1 Changing gear box oil on page 2-47

---

2.4 Check points of every 1 year

2.4.1 Checking gear box oil seal

1. Check the gear box oil seals (1), (2) for leaks. If oil seals are leaking, replace them.
2.5 Check point of every 4 years
2.5.1 Replacing gear box oil seal
1. Replace the gear box oil seals (1), (2) with new ones.

3. Front loader
3.1 Check points of daily or each use
3.1.1 Checking transmission fluid level

**WARNING**
To avoid serious injury or death:
- Park the tractor on a firm, flat, and level surface, lower the implement to the ground, and stop the engine.

**IMPORTANT**
- If the transmission fluid level is low, do not operate the engine.

1. To check the transmission fluid level, check the dipstick as the following procedure.
   a. Draw out the dipstick.
   b. Wipe the dipstick clean.
   c. Replace the dipstick.
   d. Draw the dipstick out again.
2. Check to see that the transmission fluid level lies between the two notches.
3. If the transmission fluid level is too low, add new fluid to the prescribed level at the oil inlet.

3.1.2 Checking hydraulic hoses

**WARNING**
To avoid serious injury or death:
- Escaping the hydraulic fluid under pressure can obtain sufficient force to penetrate skin, causing serious personal injury.
- Before disconnecting lines, be sure to relieve all pressure. Before applying pressure to the loader system, be sure that all connections are tight and that lines, tubes, and hoses are not damaged. Fluid escaping from a very small hole can be almost invisible. Use a piece of cardboard or wood, rather than your hands, to search for suspected leaks.
- If you are injured by escaping fluid, see a doctor at once. Serious infection or allergic reaction will develop if proper medical treatment is not administered immediately.

1. With the engine off and bucket on the ground, inspect all hydraulic hoses for cuts or wear.
2. Check for signs of leaks and make sure all fittings are tight.
3. If damage is found, replace the hoses.

### 3.2 Check points of every 10 hours

#### 3.2.1 Greasing loader

1. Grease the grease fittings of the front loader in the locations shown.
2. Grease the joints of the control lever linkage.

### 3.3 Check points of every 50 hours

#### 3.3.1 Checking torque of main frame bolt and nut

**WARNING**

To avoid serious injury or death:
- Never operate the front loader with a loose main frame.
- Any time bolts and nuts are loosened, retighten to specified torque.
- Check all bolts and nuts frequently and keep them tight.
- Check the bolts and nuts of the main frame regularly especially when they are new. If the bolts and nuts of the main frame are loose, tighten them as follows.

1. Check the torque of bolts and nuts.

<table>
<thead>
<tr>

### 4. Backhoe

#### 4.1 Check points of daily or each use

##### 4.1.1 Checking transmission fluid level

**WARNING**

To avoid serious injury or death:
- Park the tractor on a firm, flat, and level surface, lower the implement to the ground, and stop the engine.

**IMPORTANT**

- If the transmission fluid level is low, do not operate the engine.

1. To check the transmission fluid level, check the dipstick as the following procedure.
   a. Draw out the dipstick.
   b. Wipe the dipstick clean.
   c. Replace the dipstick.
   d. Draw the dipstick out again.

2. Check to see that the transmission fluid level lies between the two notches.

3. If the transmission fluid level is too low, add new fluid to the prescribed level at the oil inlet.

**WARNING**

To avoid serious injury or death:

1. Bolt and nut of the main frame
2. Bolt and nut of the main frame

**WARNING**

To avoid serious injury or death:
• Escaping the hydraulic fluid under pressure can obtain sufficient force to penetrate skin, causing serious personal injury.
• Before disconnecting lines, be sure to relieve all pressure. Before applying pressure to the loader system, be sure that all connections are tight and that lines, tubes, and hoses are not damaged. Fluid escaping from a very small hole can be almost invisible. Use a piece of cardboard or wood, rather than your hands, to search for suspected leaks.
• If you are injured by escaping fluid, see a doctor at once. Serious infection or allergic reaction will develop if proper medical treatment is not administered immediately.

1. With the engine off and bucket on the ground, inspect all hydraulic hoses for cuts or wear.
2. Check for signs of leaks and make sure all fittings are tight.
3. If damage is found, replace the hoses.

4.2 Check points of every 10 hours

4.2.1 Greasing backhoe

1. Grease the grease fittings of the backhoe in the locations shown.
4.3 Check points of every 50 hours
4.3.1 Checking torque sub frame bolt and nut

**WARNING**
To avoid serious injury or death:
- Never operate the backhoe and front loader with a loose sub frame.
- Any time bolts and nuts are loosened, retighten to specified torque.
- Check all bolts and nuts frequently and keep them tight.
- Check the bolts and nuts of the main frame regularly especially when they are new. If the bolts and nuts of the sub frame are loose, tighten them as follows.

1. Check the torque of bolts and nuts.

<table>
<thead>
<tr>
<th>Tightening torque</th>

[Diagram of sub frame and bolt]
TIRES, WHEELS, AND BALLAST

1. Tires

**WARNING**
To avoid serious injury or death:
- Do not try to mount a tire on a rim. Only a qualified person with the proper equipment should mount a tire on a rim.
- Always keep the correct tire pressure. Do not inflate the tires above the recommended pressure shown in the “Inflation pressure of tires” section.

**IMPORTANT**
- Do not use tires other than those approved by KUBOTA.
- When you intend to mount different size of tires from equipped ones, consult your dealer about front drive gear ratio for details. Excessive wear of tires may occur due to improper gear ratio.

### 1.1 Inflation pressure of tires

Though the tire pressure is factory-set to the prescribed level, it naturally drops slowly in the course of time. Thus, check it everyday and inflate as necessary.

<table>
<thead>
<tr>
<th>Tire sizes</th>
<th>Inflation pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rear</td>
<td></td>
</tr>
<tr>
<td>26×12.00-12 Turf</td>
<td>100 kPa (1.0 kgf/cm²) [14 psi]</td>
</tr>
<tr>
<td>26×12.00-12 Bar</td>
<td>120 kPa (1.2 kgf/cm²) [17 psi]</td>
</tr>
<tr>
<td>26×12.00-12 Ind.</td>
<td>120 kPa (1.2 kgf/cm²) [17 psi]</td>
</tr>
<tr>
<td>Front</td>
<td></td>
</tr>
<tr>
<td>18×8.50-10 Turf</td>
<td>120 kPa (1.2 kgf/cm²) [17 psi]</td>
</tr>
<tr>
<td>18×8.50-10 Bar</td>
<td>150 kPa (1.5 kgf/cm²) [22 psi]</td>
</tr>
<tr>
<td>18×8.50-10 Ind.</td>
<td>150 kPa (1.5 kgf/cm²) [22 psi]</td>
</tr>
</tbody>
</table>

**NOTE**
- Keep the maximum pressure in front tires, if using a front loader or when equipped with a full load of front weight.

### 1.2 Dual tires

Dual tires are not approved.

2. Wheel tread

**WARNING**
To avoid serious injury or death:
- Support the tractor securely on stands before removing a wheel.
- Never operate the tractor with a loose rim, wheel, or axle.

**IMPORTANT**
- When re-fitting or adjusting a wheel, follow the procedure.
  1. Tighten the bolts to the torques as shown in the following table.

<table>
<thead>
<tr>
<th>Tightening torques</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Front</strong></td>
</tr>
<tr>
<td>149.2 N·m to 179.0 N·m (15.2 kgf·m to 18.3 kgf·m) [110 lbf·ft to 132 lbf·ft]</td>
</tr>
<tr>
<td><strong>Rear</strong></td>
</tr>
<tr>
<td>108.5 N·m to 130.2 N·m (11.1 kgf·m to 13.3 kgf·m) [80 lbf·ft to 96 lbf·ft]</td>
</tr>
</tbody>
</table>

2. Then recheck as the following table.

| Timing to recheck the bolts | After driving the tractor 200 m (200 yards), after 1 day (8 hours), and thereafter every 50 hours |

**NOTE**
- Use the tapered bolts for wheels with beveled or tapered holes.
2. GENERAL

2.1 Front wheels

**IMPORTANT**
- Do not turn the front discs to obtain wider tread.
- Always attach the front wheels as shown in the following table.
If you do not attach the front wheels as illustrated in the table, transmission parts may be damaged.

You cannot adjust width of the front tread.

<table>
<thead>
<tr>
<th>Model</th>
<th>BX23S</th>

<td>Tire</td>
<td>18×8.50-10 Turf, 18×8.50-10 Bar, 18×8.50-10 Ind.</td>
</tr>
</tbody>
</table>

![Diagram of front wheel](image1)

**Tread**

(A) 910 mm (35.8 in.)

How to jack up the front axle

**WARNING**
To avoid serious injury or death:
- Before jacking up the tractor, park it on a firm and level ground and chock the rear wheels.
- Fix the front axle to keep it from pivoting.
- Select jacks that withstand the machine weight and set them up at jack point (2).

![Diagram of front axle jack](image2)

(1) Front axle case  (2) Jack point

2.2 Rear wheels

**IMPORTANT**
- Do not turn the rear discs to obtain wider tread.
- Always attach the rear wheels as shown in the following table.
If you do not attach the rear wheels as illustrated in the table, transmission parts may be damaged.

You cannot adjust width of the rear tread.

<table>
<thead>
<tr>

![Diagram of rear wheel](image3)

**Tread**

(B) 820 mm (32.2 in.)

How to jack up rear part of the tractor

**WARNING**
To avoid serious injury or death:
- Before jacking up the tractor, park it on a firm and level ground and chock the front wheels.
- Fix the front axle to keep it from pivoting.
- Select jacks that withstand the machine weight and set them up as shown in the following figure.

![Diagram of rear axle jack](image4)

(1) Frame  (2) Jack point
3. Ballast

**WARNING**
To avoid serious injury or death:
• You will need the additional ballast for transporting the heavy implements. When the implement is raised, drive slowly over rough ground, regardless of how much ballast is used.
• Do not fill the front wheels with liquid to keep steering control.

**NOTE**
• The ballast is not required when doing the normal operations with the BX23E tractor, the LA340 loader, and the BT603 backhoe connected in factory settings.

3.1 Front ballast

**IMPORTANT**
• Do not overload tires.
• Add no more weight than indicated in the following table.

| Maximum weight | 125 kg (275 lbs) |

Add weights if needed to improve traction or for stability. Heavy pulling and heavy rear mounted implements tend to lift front wheels. Add enough ballast to keep steering control and prevent tip over. Remove weight when no longer needed.

3.2 Rear ballast

Add weight to rear wheels if needed to improve traction or for stability. The amount of rear ballast should be matched to job and the ballast should be removed when it is not needed.

**Liquid ballast in rear tires**
The weight should be added to the tractor in the form of liquid ballast.

Water and calcium chloride solution provides safe economical ballast. Using the liquid ballast properly will prevent tires, tubes, or rims from damaging. The addition of calcium chloride is recommended to prevent the water from freezing. The addition of calcium chloride for weighting the wheels has the full approval of the tire companies. Consult your tire dealer for addition of calcium chloride.

</tr>
</tbody>
</table>

**IMPORTANT**
• Do not fill tires with water or solution more than the correct percentage of full capacity as shown in the following table to the level of valve stem at 12 o’clock position.

1BXMC00066A01

<table>
<thead>
<tr>
<th>Amount of water</th>
<th>75% of full capacity of tire</th>
</tr>
</thead>
<tbody>
<tr>
<td>Characteristic</td>
<td>Air compresses like a cushion.</td>
</tr>
</tbody>
</table>

• To avoid damage of the transmission, do not use the rear wheel weights and liquid ballast at the same time.
• Do not add liquid ballast or any other weights to the front tires.
• While BT603 backhoe is installed on the tractor, remove liquid ballast from the rear tires.

**NOTE**
• When mounting a heavy implement, a liquid in the tire may not be required.

**Rear wheel weight (option)**
You can install the rear wheel weight to the 3-point hitch.
NOTE

- Besides the rear wheel weight, a 3-point kit is required for installing the weight.
**IMPLEMENT LIMITATIONS**

1. Implement limitation tables

**IMPORTANT**
The KUBOTA tractor has been thoroughly tested for proper performance with implements sold or approved by KUBOTA.
Do not use the following implements:
- Implements which are not sold or approved by KUBOTA
- Implements which exceed the maximum specifications listed in the following table
- Implements which are otherwise unfit for use with the KUBOTA tractor
These implements may result in malfunctions or failures of the tractor, damage to other property, and injury to the operator or others.

**NOTE**
- Any malfunctions or failures of the tractor resulting from use with improper implements are not covered by the warranty.

</tr>
</tbody>
</table>

**NOTE**
- Implement size may vary depending on soil operating conditions.
- Strictly follow the instructions outlined in the operator’s manual of the mounted or trailed machinery or trailer, and do not operate the combination tractor-machine or tractor-trailer unless all instructions have been followed.
- When you use the forestry application, there are following hazards:
  - toppling trees, primarily in case a rear-mounted-tree-grab-crane is mounted at the rear of the tractor
  - penetrating objects in the operator’s enclosure, primarily in case a winch is mounted at the rear of the tractor
To deal with these hazards and other related hazards, the tractor requires optional equipment such as operator protective structure (OPS), falling object protective structure (FOPS), and so on. This optional equipment, however, is not available for this tractor. Without optional equipment such as OPS and FOPS, the use of the tractor is limited to tractor specific applications like transport and stationary work.

<sup>1</sup> KUBOTA provides BT603 backhoe for BX23S. No other backhoe installed by 3-point hitch is permitted for BX23S.

<sup>2</sup> KUBOTA provides LA340 and LA340S Front-end Loader for BX23S.

<sup>3</sup> The value contains the weight of KUBOTA standard bucket.

<sup>4</sup> Reduce speed and trailer loads when operating in slippery conditions or when operating on slopes and using front wheel drive.
SPECIAL TOOLS

1. Special tools for engine

1.1 Special use puller set
Use exclusively to pull out bearing, gears and other parts with ease.

![Image of Special Use Puller Set](image1)

Code No.
- 07916-09032

1.2 Diesel engine compression tester (for injection nozzle)
Use to measure diesel engine compression and diagnostics of need for major overhaul.

![Image of Diesel Engine Compression Tester](image2)

(1) Gauge  (7) Adaptor F
(2) L joint  (8) Adaptor G
(3) Adaptor A  (9) Adaptor H
(4) Adaptor B  (10) Adaptor I
(5) Adaptor C  (11) Adaptor J
(6) Adaptor E

Code No.
- 07909-30208 (Assembly)
- 07909-30934 (A to F)
- 07909-31211 (E and F)
- 07909-31231 (H)

1.3 Nozzle tester
Use to check the fuel injection pressure and spray pattern of nozzle.

![Image of Nozzle Tester](image3)

Code No.
- 07909-31361

Measuring range
- 0 to 50 MPa (0 to 500 kgf/cm², 0 to 7200 psi)

1.4 Injection pump pressure tester
Use to check fuel tightness of injection pumps.

NOTE
- The special tools are not provided, so make them referring to the figure.
### 1.5 Valve guide replacing tool

Use to press out and press fit the valve guide.

**NOTE**
- The special tools are not provided, so make them referring to the figure.
1.6 Bushing replacing tool
Use to press out and press fit the bushing.

3. ENGINE
1. Engine body

1.1 Function of cylinder block
The cylinder block is the main housing of engine and supports the other main parts.

The cylinder block is usually of integrated cast iron construction, and includes complete passages for coolant and lubricating oil.

1.2 Function of closed breather
Closed breather system has been adopted to prevent the release of blow-by gas into the atmosphere.

After its oil content is filtered by oil shield (4), the blow by gas in fed back to the intake manifold through breather valve (3) to be used for re-combustion.

1.3 Function of half-floating head cover
The half-floating head cover helps reduce noise coming from the cylinder head.

Rubber packing (2) is fitted in to keep the cylinder head cover (1) 0.5 mm (0.02 in.) or so off the cylinder head.
1.4 Function of piston

The piston creates the forces for the suction, compression, power and exhaust cycles.

The reciprocating motion of a piston in the engine cylinder creates the forces for the suction, compression, power and exhaust cycles. The piston's skirt is coated with molybdenum disulfide (MoS$_2$) which reduces the piston slap noise and thus the entire operating noise. The molybdenum disulfide (MoS$_2$) (1) improves the fit of the piston with the cylinder and helps to prevent scorching. This material helps resist metal wears even with little lube oil.

1.5 Function of piston ring

Piston rings are classified as compression and oil control rings. Diesel engine has two or three compression rings around the piston head and one oil ring just below them. The compression rings prevent gases from leaking by the piston during the compression and expansion strokes. They seal by expanding out against the cylinder wall. The rings expand by their own tension and also by combustion pressure behind the rings during the expansion stroke. The compression rings are split for easy assembly on the piston. The piston rings are usually made of hardened cast iron. To reduce the wear on the ring, they are often plated with chrome on their contact faces, or are coated their contact faces with molybdenum disulfide.

- The top compression ring (1) is a keystone type ring to get durability against heavy load.
- The second compression ring (2) is an undercut ring to prevent shortage of oil.
- The main job of the oil control ring (3) is to wipe the excess oil from the cylinder walls. This oil is fed through slots in the rings to holes in the piston groove, where it returns to the crankcase. For better oil control, spring expanders are often used under the oil control ring.

1.6 Function of connecting rod

The connecting rod connects the piston to the crankshaft.

The connecting rod must be light and yet strong enough to transmit the thrust of the piston to crankshaft. The big end of connecting rod has a crankpin bushing (3) (split type) and the small end has a small end bushing (1) (solid type).

1.7 Function of crankshaft

The crankshaft converts the up-and-down motion of the pistons into rotary motion. It ties together the reactions
of all the pistons into one rotary force that drives the machine.

The crankshaft is made of tough special alloy steel, and the journals, pins and oil seal sliding portions are induction hardened to increase the hardness for higher wear resistance. The front journal is supported by a split type (1) and the intermediate journal by a split type (2), and the rear journal by a split type (3) with thrust bearings (4). The crankshaft is provided with an oil gallery, through which engine oil is fed to the crankpin portion, and lubricates it.

1.8 Function of camshaft

The camshaft controls the opening and closing of the intake and exhaust valves in the cylinder head.

The camshaft (3) is normally driven by gearing from the crankshaft. This is made of special cast iron, and the journal and cam sections are chilled to resist wear. One intake and one exhaust cam is provided for each cylinder. The journal diameters are large to permit removal of the shaft from its bore. The journal sections are force lubricated.

1.9 Function of rocker arm

The rocker arm is an oscillating lever that conveys radial movement from the camshaft lobes into linear movement at the exhaust and intake valves to open and close them.

The rocker arms (2) are mounted on a rocker arm shaft (a single hollow shaft) (1) at the top of the engine. When the push rods (6) move up, the mating rocker arm is moved down, contacting its valve stem tip and opening the valve. Lubricating oil pressurized through the rocker arm bracket to the rocker arm shaft, which serves as a fulcrum so that the rocker arm and the entire system are lubricated sufficiently.

1.10 Function of flywheel

A flywheel is a rotating mechanical device that is used to store rotational energy.

The flywheel (2) is generally made of heavy cast iron or steel and has gear teeth around its outer rim, which mesh with the drive pinion of starter. The flywheel stores the rotating force in the combustion stroke as inertial energy, reduces crankshaft rotating speed fluctuation and keeps the smooth rotating conditions.
The flywheel periphery is inscribed with the marks showing fuel injection timing angle lines and top dead center mark TC. The flywheel (2) mounted on the rear of the crankshaft (1) is a stabilizer for the whole engine.

1.11 Function of timing gears

The timing gears correctly control fuel injection to the cylinders and valve timing.

![Diagram of timing gears](3EEAAA1P029A)

<table>

<td>Governor gear</td>
</tr>
<tr>
<td>5</td>
<td>Crank gear</td>
</tr>
</tbody>
</table>

The timing gears transmit torque from the crankshaft to the oil pump and injection pump and, at the same time, correctly control fuel injection to the cylinders and valve timing. Each gear has a mating mark inscribed on it for correct and easy assembly and is spherical with teeth set obliquely to the axis of rotation to rotate smoothly and reduce noise. The crankshaft is the hub around which other parts of the engine can be timed and driven. This is done by the meshing of gears as shown in the figure.
2. Lubricating system

2.1 Overview of lubricating system

This engine's lubricating system consists of oil strainer (8), oil pump (7), relief valve (9), oil filter cartridge (15) and oil pressure switch (2).
The oil pump sucks lubricating oil from the oil pan through the oil strainer and the oil flows down to the filter cartridge, where it is further filtered. Then the oil is forced to crankshaft (6), connecting rods (14), idle gear (5), camshaft (12) and rocker arm shaft (3) to lubricate each part. Some part of oil, splashed by the crankshaft or leaking and dropping from gaps of each part, lubricates these parts: piston (13), cylinders, small ends or connecting rods, tappets (11), push rods (10), inlet and exhaust valves (4) and timing gears.
2.2 Function of oil strainer
The oil strainer strains large particles from the oil.

The strainer (1) has a mesh screen (2) suitable for straining large particles from the oil and yet passes a sufficient quantity of oil to the inlet side of the oil pump. The strainer is located so all oil entering the pump from the oil pan must flow through it.

2.3 Function of oil pump
The oil pump circulates engine oil under pressure to the rotating bearings, the pistons and the camshaft.

2.4 Function of oil filter
The oil filter is responsible for filtering impurities from the oil.

In the filtration system, there is only one oil flow from the oil pump to the oil filter cartridge. After filtering, the oil goes to the lubricating portion, and is returned to the crankcase. When the filter cartridge is new, there is very little pressure drop through the filter element (1). However, if the filter gets clogged, the resulting pressure (the oil pressure in inlet line builds up by 98 kPa (1.0 kgf/cm², 14 psi) more than the outlet line) will open the bypass valve (2) and allow unfiltered oil to bypass to the lubricating portion.
2.5 Function of relief valve

The relief valve prevents the damage of the lubricating system due to high oil pressure.

The valve is closed when the spring tension is greater than the oil pressure at the inlet. The spring tension holds poppet (2) securely in position. The valve opens when the oil pressure at the inlet exceeds that of the spring (1). This pushes the poppet off the inlet hole and oil flows through the valve.

2.6 Function of oil pressure switch

The oil pressure switch activates the oil warning light when the oil pressure falls below specified value.

The oil pressure switch is mounted on the cylinder block and is led to the lubricating oil passage. When the oil pressure falls below the specified value, the oil pressure-warning lamp lights.

[A] At the proper oil pressure

When the engine is started and as the proper oil pressure builds, the diaphragm (4) is pushed up. This separates the contact rivet (5) and breaks the circuit, causing the lamp to go out.

[B] At lower oil pressure

If the oil pressure drops, the resulting deflection of the diaphragm (4) will close the contact rivet (5) and again complete the circuit. The lighted lamp warns that the pressure of the lubricating system has dropped below the pressure setting.
3. Cooling system

3.1 Overview of cooling system

The cooling system cools the engine while it operates to prevent overheating and keep a proper operating temperature. KUBOTA engines are used pressurized forced-circulation type. This system consists of a radiator (1), water pump (2), cooling fan (3), thermostat (4) and coolant temperature sensor (some models). The coolant is cooled through the radiator core, and the fan set behind the radiator pulls cooling air through the core to improve cooling. When the coolant in the engine is at a low temperature, the thermostat valve is closed so that the coolant is circulated in the engine through the bypass pipe. When the temperature of the coolant becomes the valve opening temperature of thermostat (4), the thermostat (4) opens the valve to return the heated coolant to the radiator (1). The water pump (2) sucks the cooled coolant, forces it into the cylinder block (6) and draws out the hot coolant. Some engines employ the bottom bypass system to improve the cooling performance of radiator and the three step valve opening type thermostat to reduce thermal shock radically.

KiSC issued 03, 2017 A
3.2 Function of water pump

The water pump circulates the coolant through the system.

![Water pump diagram]

(1) Bearing unit  (3) Mechanical seal
(2) Pump body  (4) Impeller

If the pump fails to circulate the coolant, heat is not removed from the engine and overheating damage may occur. KUBOTA engines use a centrifugal type, and is driven by the crankshaft via a fan belt. It is composed of a pump body (2), impeller (4), mechanical seal (3) and bearing unit (1).

3.3 Function of radiator

The radiator is one of the major components of the coolant cooling system.

![Radiator diagram]

(1) Cooling air  (3) Fin
(2) Tube

The radiator is one of the major components of the coolant cooling system. It is here that heat in the coolant is released to the atmosphere. The radiator core consists of water carrying tubes (2) and fins (3) at a right angle to the tubes. KUBOTA engines use corrugated fin type core which has a right weight and high heat transfer rate. Radiators are usually made of copper or brass. Recently, however, aluminum-made radiators are introduced for their light weight.

3.4 Function of radiator cap

The radiator cap keeps coolant from boiling out or evaporating.

![Radiator cap diagram]

(1) Overflow tube  (A) Pressure valve open
(2) Pressure valve  (B) Vacuum valve open
(3) Vacuum valve

The pressure system permits operating the engine at a higher temperature without boiling the coolant or losing it by evaporation. The radiator cap consists of a pressure valve (2), vacuum valve (3), valve springs, gasket, and has two functions.

(A) Pressure valve open
The pressure valve (2) in the cap permits the escape of coolant or steam when the pressure reaches a certain point (88 kPa, 0.90 kgf/cm², 13 psi).

(B) Vacuum valve open
The vacuum valve (3) in the cap opens to prevent a vacuum in the cooling system.
4. Fuel system

4.1 Overview of fuel system

Fuel from the fuel tank (3) passes through the fuel filter (4), and then enters the injection pump (7) after impurities such as dirt, water, etc. are removed. The fuel pressurized by the injection pump to the opening pressure (13.7 to 14.7 MPa, 140 to 150 kgf/cm², 1990 to 2133 psi), of the injection nozzle (1) is injected into the combustion chamber. Part of the fuel fed to the injection nozzle (1) lubricates the moving parts of the needle valve inside the nozzle, then returns to the fuel tank through the fuel overflow pipe (2) from the upper part of the nozzle holder.

4.2 Function of fuel filter

The fuel filter filters impurities from the fuel.

In-line filter is installed in the fuel line with an electromagnetic fuel feed pump and is used to filter impurities such as dirt, water, etc.

4.3 Function of fuel feed pump

An electromagnetic fuel feed pump is used when a fuel tank is set below the pump of the engine.

An electromagnetic fuel feed pump uses a transistor that causes the pump to start pumping fuel when the main switch is turned to the ON position. Therefore, fuel is supplied to the injection pump regardless of engine speed. This pump is driven by the battery. It can therefore be operated even with the engine being stopped.

4.4 Function of injection nozzle

(1) Bar filter
(2) Nozzle holder body
(3) Adjusting washer
(4) Nozzle spring
(5) Push rod
(6) Retaining nut
(7) Nozzle piece
(8) Needle valve
(9) Heat seal
(10) Gasket
Uses as E-TVCS system, the small-sized DENSO made OPD mini nozzle is of a flat-cut-provided double throttle type. This type of nozzle is designed to control the injection quantity when the lift rate is low at start of the injection, and to cut down on the knocking sound caused by excessive fuel injection by giving the needle valve (8) section more taper than before to prevent the rapid increase in the injection quantity when the initial injection turns into the full-force injection. Also, employed to prevent the injection quantity loss in the throttle section caused by carbon, the flat cut provided at the needle valve section helps the throttle withstand long use and reduce as much knocking sound as when it was new. The heat seal (9) is employed to improve the durability and reliability of the nozzle.

3. Tightening torques for engine

Tightening torques of screws, bolts and nuts on the table below are especially specified.

**NOTE**
- In removing and applying the bolts and nuts marked with "***", a pneumatic wrench or similar pneumatic tool, if employed, must be used with enough care not to get them seized.
- For the screws, bolts and nuts with the mark "**", apply engine oil to their threads and seats before you tighten.
- The letter "M" in Dimension × Pitch shows that the screw, bolt or nut dimensions are in the metric system.
  The dimension is the nominal external diameter in mm of the threads. The pitch is the nominal distance in mm between 2 threads.

**RELATED PAGE**

TIGHTENING TORQUES on page 2-13
4. Checking and adjusting

4.1 Engine body

4.1.1 Checking compression pressure

**NOTE**
- Check the compression pressure with the specified valve clearance.
- Always use a fully charged battery for performing this test.
- Variances in cylinder compression values should be under 10%.

1. Operate the engine until it is warmed up.
2. Stop the engine.
3. Remove the air cleaner, the muffler and all glow plugs (or nozzles).
4. Set a compression tester with the adapter to the glow plug hole (or nozzle hole).

**Nozzle hole:**
- Adapter H (07909-31231)

**Glow plug hole:**
- Adapter L (07909-31301)

5. Disconnect the connector of engine stop solenoid and keep the engine stop position (non-injection). Then, operate the engine with the starter and measure the compression pressure.
6. Repeat steps 4 and 5 for each cylinder.
7. If the measurement is below the allowable limit, apply a small amount of oil to the cylinder wall through the glow plug hole (or nozzle hole) and measure the compression pressure again.

<table>
<thead>
<tr>
<th>Compression pressure</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>3.53 to 4.02 MPa</td>
</tr>
<tr>
<td></td>
<td>36.0 to 41.0 kgf/cm²</td>
</tr>
<tr>
<td></td>
<td>512 to 583 psi</td>
</tr>
<tr>
<td>Allowable limit</td>
<td>2.55 MPa</td>
</tr>
<tr>
<td></td>
<td>26.0 kgf/cm²</td>
</tr>
<tr>
<td></td>
<td>370 psi</td>
</tr>
</tbody>
</table>

8. If the compression pressure is still less than the allowable limit, check the top clearance, valve clearance and cylinder head.
9. If the compression pressure increases after applying oil, check the cylinder wall and piston rings.

4.1.2 Checking valve clearance

**IMPORTANT**
- Valve clearance must be checked and adjusted when engine is cold.

**NOTE**
- The sequence of cylinder numbers is given as No. 1, No. 2 and No. 3 starting from the gear case side.
- After adjusting the valve clearance, secure the adjusting screw with the lock nut.
3. Check the following valve clearance marked with "★" using a feeler gauge.
4. If the clearance is not within the factory specifications, adjust with the adjusting screw.

<table>
<thead>
<tr>
<th>Intake and exhaust valve clearance (Cold)</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.145 to 0.185 mm</td>
</tr>
<tr>
<td></td>
<td>0.00571 to 0.00728 in.</td>
</tr>
</tbody>
</table>

5. Then turn the flywheel 6.28 rad (360°), and align the “1TC” mark at “1TC” and "timing line" (1) on the flywheel and alignment mark (2) on the rear end plate so that the No. 1 piston comes to the overlap position.
6. Check the following valve clearance marked with "☆" using a feeler gauge.
7. If the clearance is not within the factory specifications, adjust with the adjusting screw.

4.2 Lubricating system
4.2.1 Checking engine oil pressure

1. Remove the engine oil pressure switch, and set an oil pressure tester.
2. Start the engine. After warming up, measure the oil pressure of both idling and rated speeds.

Valve clearance marked with "★" can be adjusted.

1. Remove the cylinder head cover and the glow plugs.
2. Align the “1TC” mark at “1TC” and "timing line" (1) on the flywheel and alignment mark (2) on the rear end plate so that the No. 1 piston comes to the compression top dead center.
3. If the oil pressure is less than the allowable limit, check the following.
   - Engine oil insufficient
   - Oil pump damaged
   - Oil strainer clogged
   - Oil filter cartridge clogged
   - Oil gallery clogged
   - Excessive oil clearance
   - Foreign matter in the relief valve
   - Relief valve spring length.

### Engine Oil Pressure

<table>

</tbody>
</table>

### 4.3 Cooling System

#### 4.3.1 Checking Fan Belt Tension
1. Measure the deflection (A), depressing the belt halfway between the fan drive pulley and alternator pulley at specified force.

![Fan Belt Diagram](image_url)

2. If the measurement is not within the factory specifications, loosen the alternator mounting screws and relocate the alternator to adjust.

#### 4.3.2 Checking Fan Belt Damage and Wear
1. Check the fan belt for damage.
2. If the fan belt is damaged, replace it.

![Fan Belt Damage Images](image_url)

3. Check if the fan belt is worn and sunk in the pulley groove.
4. If the fan belt is nearly worn out and deeply sunk in the pulley groove, replace it.

#### 4.3.3 Checking Radiator Cap Air Leakage

**CAUTION**
- When removing the radiator cap, wait at least ten minutes after the engine has stopped and cooled down. Otherwise, hot water may gush out, scalding nearby people.
1. Set a radiator tester (1) and an adapter (2) on the radiator cap.
2. Apply the specified pressure.

<table>
<thead>
<tr>
<th>Specified pressure</th>
<th>88 kPa</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.90 kgf/cm²</td>
</tr>
<tr>
<td></td>
<td>13 psi</td>
</tr>
</tbody>
</table>

3. If the measurement is less than the factory specification, replace the radiator cap.

4. Check the radiator for water leaks.
4.3.5 Checking thermostat valve opening temperature

CAUTION
- When removing the radiator cap, wait at least ten minutes after the engine has stopped and cooled down. Otherwise, hot water may gush out, scalding nearby people.

NOTE
- The pressure of the leak test is different from each radiator specification. Thus, do the leak test referring to the test pressure of each radiator specification.

1. Pour a specified amount of water into the radiator.
2. Set a radiator tester (1) and an adaptor (2) and raise the water pressure to the specified pressure.

1. Suspend the thermostat in the water by a string with its end inserted between the valve and seat.
2. Heating the water gradually, read the temperature when the valve opens and leaves the string.
3. Continue heating and read the temperature when the valve opens.

<table>
<thead>
<tr>
<th>Valve opens</th>
<th>Approximately</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>8 mm 0.3 in.</td>
</tr>
</tbody>
</table>
4. If the measurement is not within the factory specifications, replace the thermostat.

</tr>
</tbody>
</table>

4.4 Fuel system

4.4.1 Checking injection timing

**NOTE**
- The liquid gasket is not required for assembling.
- Shims are available in thickness of 0.20 mm (0.0079 in.), 0.25 mm (0.0098 in.), 0.30 mm (0.012 in.) and 0.175 mm (0.00689 in.). Combine these shims for adjustments.
- Addition or reduction of shim (0.05 mm, 0.002 in.) delays or advances the injection timing by approx. 0.009 rad (0.5°).
- In disassembling and replacing the injection pump, be sure to use the same number of new shims with the same thickness.
- The 0.175 mm thick shim is coated only on the lower face. Therefore, do not use the 0.175 mm thick shim as the top shim of the combination (injection pump side), because this can cause oil leakage.

1. Remove the injection pipes.
2. Remove the engine stop solenoid.
3. Turn the flywheel counterclockwise (viewed from flywheel side) until the fuel fills up to the hole of the delivery valve holder (3) for No. 1 cylinder.
4. After the fuel fills up to the hole of the delivery valve holder for No. 1 cylinder, turn back (clockwise) the flywheel around 1.6 rad (90°).
5. Turn the flywheel counterclockwise to set at around 0.44 rad (25°) before T.D.C.
6. Slowly turn the flywheel counterclockwise and stop turning when the fuel begins to come up, to get the present injection timing.
7. Check to see the degree on flywheel.
   The flywheel has mark “1TC”, “10” and “20” for the crank angle before the top dead center of No. 1 cylinder.
8. If injection timing is out of adjustment, readjust the timing with shims.

<table>
<thead>
<tr>
<th>Injection timing</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.3360 to 0.3621 rad (19.25 to 20.75°) before T.D.C.</td>
</tr>
</tbody>
</table>

4.4.2 Checking fuel tightness of pump element

**NOTE**
- Never try to disassemble the injection pump assembly. For repairs, you are strongly requested to contact a Kubota-authorized pump service shop.

1. Remove the engine stop solenoid.
2. Remove the injection pipes and glow plugs.
3. Install the injection pump pressure tester to the injection pump.
4. Install the injection nozzle (2) jetted with the proper injection pressure to the injection pump pressure tester (1). (Refer to the photo.)
5. Set the speed control lever to the maximum speed position.
6. Run the starter to increase the pressure.
7. If the pressure cannot reach the allowable limit, replace the pump with new one or repair with a Kubota-authorized pump service shop.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

4.4.3 Checking fuel tightness of delivery valve

**NOTE**
- Never try to disassemble the injection pump assembly. For repairs, you are strongly requested to contact a Kubota-authorized pump service shop.

1. Remove the engine stop solenoid.
2. Remove the injection pipes and glow plugs.
3. Set a pressure tester to the fuel injection pump.
4. Install the injection nozzle (2) jetted with the proper injection pressure to the injection pump pressure tester (1).
5. Run the starter to increase the pressure.
6. Stop the starter when the fuel jets from the injection nozzle. After that, turn the flywheel by the hand and raise the pressure.
7. Now turn the flywheel back about half a turn (to keep the plunger free). Keep the flywheel at this position and clock the time taken for the pressure to drop.
8. Measure the time needed to decrease the pressure.
9. If the measurement is less than allowable limit, replace the pump with new one or repair with a Kubota-authorized pump service shop.

<table>

4.4.4 Checking nozzle spraying condition

**CAUTION**
- Check the nozzle injection pressure and condition after you make sure that there is nobody standing in the direction the fume goes. If the fume from the nozzle directly contacts the
human body, cells may be destroyed and blood poisoning may be caused.

(a) Good  (b) Bad

1. Set the injection nozzle to a nozzle tester, and check the nozzle spraying condition.
2. If the spraying condition is damaged, replace the nozzle piece.

4.4.5 Checking fuel injection pressure

**CAUTION**
- Check the nozzle injection pressure and condition after you make sure that there is nobody standing in the direction the fume goes. If the fume from the nozzle directly contacts the human body, cells may be destroyed and blood poisoning may be caused.

(Reference)

<table>
<thead>
<tr>
<th>Pressure variation (0.01 mm (0.0004 in.))</th>
<th>Factory specification</th>
<th>Approximately 235 kPa 2.4 kgf/cm² 34 psi</th>
</tr>
</thead>
</table>

Pressure variation difference of adjusting washer thickness

1. Set the injection nozzle to a nozzle tester.
2. Slowly move the tester handle to measure the pressure at which fuel begins jetting out from the nozzle.
3. If the measurement is not within the factory specifications, replace the adjusting washer (1) in the nozzle holder to adjust it.

4.4.6 Checking valve seat tightness

**CAUTION**
- Check the nozzle injection pressure and condition after you make sure that there is nobody standing in the direction the fume goes. If the fume from the nozzle directly contacts the human body, cells may be destroyed and blood poisoning may be caused.
1. Set the injection nozzle to a nozzle tester.

2. Raise the fuel pressure, and keep at specified pressure for 10 seconds.

<table>
<thead>
<tr>
<th>Valve seat tightness</th>

</tr>
</thead>
<tbody>
<tr>
<td>No fuel leak at 12.75 MPa 130.0 kgf/cm² 1849 psi</td>
<td></td>
</tr>
</tbody>
</table>

3. If any fuel leak is found, replace the nozzle piece.

4.4.7 Checking nozzle holder

⚠️ CAUTION
• Check the nozzle injection pressure and condition after you make sure that there is nobody standing in the direction the fume goes. If the fume from the nozzle directly contacts the human body, cells may be destroyed and blood poisoning may be caused.

1. Secure the nozzle retaining nut (7) with a vise.
2. Remove the nozzle holder (1), and remove parts inside.

(When reassembling)
• Assemble the nozzle in clean fuel oil.
• Install the push rod (4), noting its direction.
• After assembling the nozzle, be sure to adjust the fuel injection pressure.

5. Disassembling and assembling

5.1 Separating engine

5.1.1 Draining engine oil
1. Start and warm up the engine for approx. 5 minutes.
2. Place an oil pan underneath the engine.
3. Remove the drain plug (1) to drain oil.

![Image of drain plug](image1)

(1) Drain plug

4. After draining, reinstall the drain plug (1).

(When refilling)

**IMPORTANT**
- Never mix two different type of oil.
- Use the proper SAE Engine Oil according to ambient temperature.
- Fill the engine with the new engine oil through the oil inlet (2) to the upper line on the dipstick (3).

![Image of oil inlet and dipstick](image2)

LUBRICANTS, FUEL AND COOLANT on page 2-7
5.1.3 Removing bonnet

1. Remove the front guard (3).
2. Open the bonnet.
3. Disconnect the headlight harness from the headlights and bonnet.
4. Disconnect the bonnet guide rod from the bonnet.
5. Disconnect the L.H. and R.H. bonnet brackets (2) from the frame.
6. Remove the bonnet (1).

5.1.4 Disconnecting wiring harness and ground cables

1. Disconnect the starter connector and cable (1), oil pressure switch (2), alternator connector and cable (3) and coolant temperature switch (4).
2. Disconnect the stop solenoid (5) and glow plug wire (6).
3. Disconnect the ground cables (7), (8), and (9).

(7) Ground cable (Starter to frame)
(8) Ground cable (Harness to frame)
(9) Ground cable (Battery to L.H. engine support)

(10) Ground cable (Wire harness to R.H. engine support)

</tbody>
</table>

5.1.8 Separating engine

**WARNING**

To avoid serious injury or death:

- The engine is heavy. Use a hoist or crane when removing the engine.

1. Remove the engine mounting nuts (1) from both sides of the engine.

**NOTE**

- The rear engine mounting nuts secure ground cables to the L.H. and R.H. engine supports. If the rear engine mounting nuts have already been removed from a previous step, just remove the front engine mounting nuts.

2. Securely attach the lifting chain to the engine hooks (2), (3) and separate the engine assembly with the radiator from the frame.

(When reassembling)

<table>
<thead>

5.1.9 Draining coolant and removing outer engine parts

**CAUTION**
• Never open the radiator cap while operating or immediately after stopping. Otherwise, hot water will spout out from the radiator. Wait for more than ten minutes to cool the radiator, before opening the cap.

1. Connect the engine stands (9) to the crankcase.
2. Open the radiator drain plug, and remove radiator cap to completely drain the coolant.
3. After all coolant is drained, close the drain plug.
4. Loosen the inlet hose band and the radiator hose bands, and remove the radiator (1) with the radiator hoses (2) and the air cleaner (3).
5. Loosen the fan belt. Remove the alternator (6), the starter motor (8), the fan and the fan belt.
6. Remove the heat proof cover (7), the muffler (5) and the exhaust manifold.

(When reassembling)

5.2 Disassembling the engine
5.2.1 Cylinder head and valve
5.2.1.1 Removing cylinder head cover
1. Disconnect the breather hose.
2. Remove the cylinder head cover nuts.
3. Remove the cylinder head cover (1).

(When reassembling)
• Check to see if the cylinder head cover gasket is not damaged.
5.2.1.2 Removing injection pipes

1. Loosen the screws to the pipe clamp (1).
2. Remove the injection pipes (2).

(When reassembling)
- Send compressed air into the pipes to blow out dust. Then, reassemble the pipes in the reverse order.

5.2.1.3 Removing nozzle holder assembly and glow plug

1. Remove the overflow pipe (1).
2. Remove the nozzle holder assemblies (4).

5.2.1.4 Removing nozzle heat seal

**IMPORTANT**
- Use a plus (phillips head) screw driver (1) that has a diameter which is bigger than the heat seal hole.

<table>
<thead>
<tr>
<th>Heat seal hole</th>
<th>Factory specification</th>
<th>Heat seal hole</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Approximately 6 mm (1/4 in.)</td>
</tr>
</tbody>
</table>
1. Drive screw driver (1) lightly into the heat seal hole.
2. Turn screw driver three or four times each way.
3. While turning the screw driver, slowly pull the heat seal (4) out together with the injection nozzle gasket (3).
4. If the heat seal drops, repeat the above procedure.

**When reassembling**
- Heat seal and injection nozzle gasket must be changed when the injection nozzle is removed for cleaning or for service.

### 5.2.1.5 Removing rocker arm and push rod

1. Remove the rocker arm bracket screw.
2. Remove the rocker arm assembly (1).
3. Remove the push rods (2).

**When reassembling**

- **IMPORTANT**
  - After installing the rocker arm, be sure to adjust the valve clearance.

### 5.2.1.6 Removing cylinder head and cylinder head gasket

<table>
<thead>

- BX23S, LA340, BT603, RCK54D, RCK60D, RCK54, RCK60B

KiSC issued 03, 2017 A
(a) to (n):
To tighten

1. Loosen the pipe clamps (1), and remove the water return pipe (2).

2. Remove the cylinder head screw in the order of (n) to (a) and remove the cylinder head.

3. Remove the cylinder head gasket.

(When reassembling)

**NOTE**
- Do not use O-ring on the pin pipe.
- It is not necessary to retighten the cylinder head screw and to readjust valve clearance after engine warmed up.

- Replace the cylinder head gasket with a new one.
- When mounting the gasket, set it to the pin pipe holes. Be careful not to mount it reversely.
- The cylinder head should be free of scratches and dust.
- Install the cylinder head, using care not to damage the gasket.
- After applying engine oil to the thread of screws, tighten them in several steps and specified sequence (a) to (n).

<table>
<thead>

</table>

5.2.1.7 Removing tappets

**IMPORTANT**
- Do not change the combination of tappet and tappet guide.

1. Remove the tappets (1) from the crankcase.

5.2.1.8 Removing valves

**IMPORTANT**
- Do not change the combination of valve and valve guide.

1. Remove the valve caps (2).
2. Remove the valve spring collet (3), pushing the valve spring retainer (4) by valve spring replacer (1).
3. Remove the valve spring retainer (4), valve spring (5) and valve stem seal (6).
4. Remove the valve (7).

(When reassembling)
- Wash the valve stem and valve guide hole, and apply engine oil sufficiently.
• After installing the valve spring collets, lightly tap the stem to assure proper fit with a plastic hammer.

5.2.1.9 Removing thermostat assembly

![Thermostat cover mounting screws diagram](3GFA8AB1P041C)

1. Remove the thermostat cover mounting screws (1), and remove the thermostat cover (2).
2. Remove the thermostat assembly (4).

(When reassembling)
- Apply a liquid gasket (Three Bond 1215 or equivalent) only at the thermostat cover side of the gasket (3).

5.2.2 Gear case and timing gears

5.2.2.1 Removing oil pan and oil strainer

![Oil pan and oil strainer diagram](3EAAEAE1P008A)

1. Remove the oil pan mounting screws.
2. Remove the oil pan (2).
3. Remove the oil strainer (1).

(When reassembling)
- Scrape off the old adhesive completely. Wipe the sealing surface clean using waste cloth soaked with gasoline. Now apply new adhesive thick all over the contact surface. Apply the adhesive also on the center of the flange as well as on the inner wall of each screw hole.

<table>
<thead>
<tr>
<th>New adhesive</th>
<th>Apply</th>
<th>Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>3.0 to 5.0 mm (0.12 to 0.19 in.)</td>
</tr>
</tbody>
</table>

- Cut the nozzle of the "liquid gasket" container at its second notch. Apply "liquid gasket" about 5.0 mm (0.19 in.) thick. Within 20 minutes after the application of fluid sealant, reassemble the components. Wait then for about 30 minutes, and pour oil in the crankcase.

<table>
<thead>
<tr>
<th>Liquid gasket</th>
<th>Apply</th>
<th>Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>5.0 mm 0.19 in.</td>
</tr>
</tbody>
</table>

- After cleaning the oil strainer, check to see that the filter mesh in clean, and install it.
- Visually check the O-ring, apply engine oil, and install it.
- Securely fit the O-ring to the oil strainer.
- To avoid uneven tightening, tighten oil pan mounting screws in diagonal order from the center.

5.2.2.2 Removing fan drive pulley

1. Secure the flywheel to keep it from turning.
2. Remove the fan drive pulley screw.
3. Draw out the fan drive pulley with a puller.
(When reassembling)
- Install the pulley to crankshaft, aligning the mark (1) on them (3-cylinder engine).

• Aligning mark

- Apply engine oil to the fan drive pulley retaining screw. And tighten it.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Fan drive pulley screw</th>
</tr>
</thead>
<tbody>
<tr>
<td>118 to 127 N·m</td>
<td>12.0 to 13.0 kgf·m</td>

<tr>
<td>86.8 to 94.0 lbf·ft</td>
<td>118.0 to 127.0 lbf·ft</td>
</tr>
</tbody>
</table>

5.2.2.3 Removing gear case

1. Remove the fuel feed pump.
2. Remove the gear case.

(When reassembling)
- Grease thinly to the oil seal, and install it, ensuring the lip does not come off.

5.2.2.4 Removing speed control plate

1. Remove the engine stop solenoid.
2. Remove the speed control plate (1).

(When reassembling)
- Apply a liquid gasket (Three Bond 1215 or equivalent) to both sides of the solenoid cover gasket and control plate gasket.
- Be careful not to drop the governor spring (2) into the crankcase.
5.2.2.5 Removing injection pump

1. Disconnect the start spring (4) on the thrust lever (5) side.
2. Align the control rack pin (2) with the notch (1) on the crankcase, and remove the injection pump (3).
3. Remove the injection pump shims.
4. In principle, the injection pump should not be disassembled.

(When reassembling)

**NOTE**

- Addition or reduction of shim delays or advances the injection timing.

<table>
<thead>
<tr>
<th>Shim (0.05 mm (0.002 in.))</th>
<th>Delays or advances the injection timing</th>
<th>Approximately</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>0.0087 rad</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0.50°</td>
</tr>
</tbody>
</table>

- In disassembling and replacing, be sure to use the same number or new gasket shims with the same thickness.
- When installing the injection pump, insert the control rack pin (2) firmly into the groove (7) of the thrust lever of fork lever.
5.2.2.6 Removing cam gear, idle gear 1, 2 and governor gear

1. Remove the idle gear 1 (4).
2. Remove the fuel camshaft stopper (7).
3. Draw out the fuel cam gear (1) with fuel camshaft (8).
4. Remove the camshaft stopper bolt.
5. Remove the cam gear (3) with camshaft.

6. Remove the external snap ring (10) from the governor shaft (11).
7. Remove the governor gear (6) with governor shaft (11).

**NOTE**
- Three-lever type fork lever
  To remove the governor shaft, follow the procedures in 5, 6 above and never remove fork lever and the max. torque limiter.

(When reassembling)

**IMPORTANT**
- When replacing the ball bearing of governor shaft, securely fit the ball bearing (9) to the crankcase, apply an adhesive (Three Bond 1324B or equivalent) to the set screw (12), and fasten the screw until its tapered part contacts the circumferential end of the ball bearing.
- When installing the idle gear, be sure to align the alignment marks (2) on each gears.
- Apply engine oil thinly to the fuel camshaft before installation.
- Make sure to assemble the external snap ring of the governor shaft.
- Check the governor shaft for smooth rotation.
5.2.3 Piston and connecting rod

5.2.3.1 Removing connecting rod

1. Remove the connecting rod cap.

(When reassembling)
- Align the marks (a) with each other. (Face the marks toward the injection pump.)

2. Apply engine oil to the connecting rod screws and lightly screw it in by hand, then tighten it to the specified torque.
   If the connecting rod screw does not screw in smoothly, clean the threads.
   If the connecting rod screw is still hard to screw in, replace it.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Connecting rod screw</th>
</tr>
</thead>

<tr>
<td>27 to 30 N⋅m</td>
<td>2.7 to 3.1 kgf⋅m</td>
</tr>
<tr>
<td>20 to 22 lbf⋅ft</td>
<td></td>
</tr>
</tbody>
</table>

5.2.3.2 Removing pistons

1. Turn the flywheel and bring the piston to top dead center.
2. Draw out the piston upward by lightly tapping it from the bottom of the crankcase with the grip of a hammer.
3. Draw out the other piston in the same method as above.

(When reassembling)

**IMPORTANT**
- Do not change the combination of cylinder and piston. Make sure of the position of each piston by marking. For example, mark “1” on the No. 1 piston.
- When installing the piston into the cylinder, place the gaps of all the piston rings as shown in the figure.

(A) Top ring gap (a) 0.79 rad (45°)
(B) Second ring gap (b) 0.79 rad (45°)
(C) Oil ring gap (c) 1.6 rad (90°)
(D) Piston pin hole

- Carefully insert the pistons using a piston ring compressor (1). Otherwise, their chrome-plated section may be scratched, causing trouble inside the cylinder.
3. ENGINE

5. Disassembling and assembling

5.2.3.3 Removing piston ring and connecting rod

<td>(3) Oil ring</td>
<td>(4) Piston pin snap ring</td>
<td>(5) Piston</td>
<td>(6) Connecting rod</td>
<td>(7) Piston pin</td>
<td>(8) Mark on connecting rod</td>
<td>(9) Fan-shaped concave</td>
<td>(10) Expander joint</td>
<td>(11) Oil ring gap</td>
</tr>
</tbody>
</table>

1. Remove the piston rings using a piston ring tool.
2. Remove the piston pin (7), and separate the connecting rod (6) from the piston (5).

(When reassembling)

**NOTE**

- Mark the same number on the connecting rod and the piston so as not to change the combination.
- Install the rings so that the manufacturer's mark (12) near the gap faces the top of the piston.

- When inserting the piston into the cylinder, apply enough engine oil to the piston.
- When inserting the piston into the cylinder, face the mark on the connecting rod to the injection pump.

- When installing the oil ring onto the piston, place the expander joint (10) on the opposite side of the oil ring gap (11).

- When installing the connecting rod to the piston, align the mark (8) on the connecting rod to the fan-shaped concave (9).

Temperature of oil  | Factory specification  | For 10 to 15 minutes 80 °C (176 °F)
---|---|---
80 °C (176 °F) |
5.2.4 Flywheel and crankshaft

5.2.4.1 Removing flywheel

1. Secure the flywheel to keep it from turning, using a flywheel stopper.
2. Remove all flywheel screws (1) and then remove the flywheel (2).

(When reassembling)
- Align the “1TC” mark (a) on the outer surface of the flywheel horizontally with the alignment mark (b) on the rear end plate. Now fit the flywheel in position.

- Apply engine oil to the threads and the undercut surface of the flywheel screw and fit the screw.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Flywheel screw</th>
</tr>
</thead>
<tbody>
<tr>
<td>54 to 58 N·m</td>
<td>5.5 to 6.0 kgf·m</td>
</tr>
<tr>
<td>40 to 43 lbf·ft</td>
<td></td>
</tr>
</tbody>
</table>

5.2.4.2 Removing bearing case cover

1. Remove the bearing case cover mounting screws.
2. Remove the bearing case cover (6).

(When reassembling)
- Fit the bearing case gasket (3) and the bearing case cover gasket (4) with correct directions.
5.2.4.3 Removing crankshaft assembly

**IMPORTANT**
- Be careful to protect crankshaft bearing 1 from scratches, caused by the crank gear, etc. (Wrap the gear in vinyl tape, etc.)

1. Remove the main bearing case screw 2 (1).
2. Pull out the crankshaft assembly.

(When reassembling)
- Clean the oil passage of the crankshaft with compressed air.
- Apply oil to the main bearing case screw 2 (1).
- Install the crankshaft assembly, aligning the screw hole of main bearing case with the screw hole of crankcase.

<table>
<thead>
<tr>
<th>Tightening torque</th>

<td>7.24 to 8.31 lbf • ft</td>
<td></td>
</tr>
</tbody>
</table>

5.2.4.4 Removing main bearing case assembly

1. Remove the two main bearing case screws 1 (2) of each main bearing cases.
2. Remove the main bearing case from crankshaft.

(When reassembling)
- Clean the oil passage in the main bearing cases.
- Apply clean engine oil on the bearings.
- Install the main bearing case assemblies in the original positions. Since diameters of main bearing cases vary, install them in order of markings (b) (“A”, “B”, “C”) from the gear case side.
- Match the alignment numbers (a) on the main bearing case assembly 1.
- When installing the main bearing case 1 and 2, face the mark “FLYWHEEL” to the flywheel.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Main bearing case screw 2</th>

</tbody>
</table>

6. Servicing

6.1 Cylinder head and valve

6.1.1 Checking top clearance

1. Remove the cylinder head.
2. With the piston at T.D.C., use grease to affix three or four plastigauges (1) of a diameter 1.5 mm (0.059 in.) × 5.0 to 7.0 mm (0.20 to 0.27 in.) long to the crown of the piston; keep the gauges away from the intake valve and combustion chamber fittings.
3. Take the piston to an intermediate position, install the cylinder head and tighten the head bolts to the specified torque.
4. Turn the crankshaft so the piston goes through T.D.C.
5. Remove the cylinder head and compare the width of the crushed plastigauges (2) with the scale.
6. If they are out of specification, check the oil clearance of the crank pin, journals and piston pins.

<table>
<thead>
<tr>
<th>Top clearance</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.55 to 0.70 mm</td>
</tr>
<tr>
<td></td>
<td>0.022 to 0.027 in.</td>
</tr>
</tbody>
</table>

NOTE
• Top clearance = Width of the crushed plastigauge (2).

6.1.2 Checking cylinder head surface flatness

IMPORTANT
• Do not place the straightedge on the combustion chamber.
• Be sure to check the valve recessing after correcting.

1. Clean the cylinder head surface.
2. Place a straightedge on the cylinder head’s four sides and two diagonal as shown in the figure.
3. Measure the clearance with a thickness gauge.

4. If the measurement exceeds the allowable limit, correct it with a surface grinder.

<table>
<thead>
<tr>
<th>Cylinder head surface flatness</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.05 mm</td>
</tr>
<tr>
<td></td>
<td>0.002 in.</td>
</tr>
</tbody>
</table>

6.1.3 Checking cylinder head flaw

1. Prepare an air spray red check.
2. Clean the surface of the cylinder head with detergent (2).
3. Spray the cylinder head surface with the red permeative liquid (1). Leave it five to ten minutes after spraying.
4. Wash away the red permeative liquid on the cylinder head surface with the detergent (2).
5. Spray the cylinder head surface with white developer (3).
6. If flawed, it can be identified as red marks.

6.1.4 Checking valve recessing

1. Clean the cylinder head surface, valve face and valve seat.
2. Insert the valve into the valve guide.
3. Measure the valve recessing with a depth gauge.
4. If the measurement exceeds the allowable limit, replace the valve.

<table>
<thead>
<tr>
<th>Valve recessing</th>
<th>Factory specification</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recessing</td>
<td>0.10 (recessing) mm</td>
<td>0.030 (recessing) mm</td>
</tr>
<tr>
<td></td>
<td>0.0039 (recessing) in.</td>
<td>0.012 (recessing) in.</td>
</tr>
</tbody>
</table>

5. If it still exceeds the allowable limit after replacing the valve, replace the cylinder head.

6.1.5 Checking clearance between valve stem and valve guide

1. Remove carbon from the valve guide section.
2. Measure the valve stem O.D. with an outside micrometer.

Valve stem O.D. Factory specification 5.968 to 5.980 mm 0.2350 to 0.2354 in.

3. Measure the valve guide I.D. with a small hole gauge, and calculate the clearance.

Valve guide I.D. Factory specification 6.010 to 6.025 mm 0.2367 to 0.2372 in.

4. If the clearance exceeds the allowable limit, replace the valves. If it still exceeds the allowable limit, replace the valve guide.

Clearance between valve stem and valve guide Factory specification 0.030 to 0.057 mm 0.0012 to 0.0022 in. Allowable limit 0.10 mm 0.0039 in.

6.1.6 Replacing valve guide

IMPORTANT
• Do not hit the valve guide with a hammer during replacement.

(When removing)
1. Press out the used valve guide using a valve guide replacing tool. (See “Special tools”.)

(When installing)
1. Clean a new valve guide and valve guide bore, and apply engine oil to them.
3. Ream precisely the I.D. of the valve guide to the specified dimension.

Valve guide I.D. (Intake and exhaust) Factory specification 6.010 to 6.025 mm 0.2367 to 0.2372 in.

— RELATED PAGE —
1. Special tools for engine on page 2-61
6.1.7 Checking valve seating

1. Coat the valve face lightly with prussian blue and put the valve on its seat to check the contact.

![Image of valve face coated with prussian blue](image)

2. If the valve does not seat all the way around the valve seat or the valve contact is less than 70%, correct the valve seating as follows.

3. If the valve contact does not comply with the reference value, replace the valve or correct the contact of valve seating.

<table>
<thead>
<tr>
<th>Valve seat width</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2.12 mm</td>
</tr>
<tr>
<td></td>
<td>0.835 in.</td>
</tr>
</tbody>
</table>

6.1.8 Correcting valve

**NOTE**
- Before correcting the valve and seat, check the valve stem and the I.D. of valve guide section, and repair them if necessary.

1. Correct the valve with a valve refacer.

6.1.9 Correcting valve seat

**NOTE**
- Before correcting the valve and seat, check the valve stem and the I.D. of valve guide section, and repair them if necessary.
1. Slightly correct the seat surface with a 1.0 rad (60°) (intake valve) or 0.79 rad (45°) (exhaust valve) valve seat cutter.

<table>
<thead>
<tr>
<th>Valve seat angle</th>
<th>Factory specification</th>
<th>0.79 rad 45°</th>
</tr>
</thead>
</table>

2. Resurface the seat surface with a 0.52 rad (30°) valve seat cutter to intake valve seat and with a 0.26 rad (15°) valve seat cutter to exhaust valve seat so that the width is close to specified valve seat width (2.12 mm, 0.0835 in.).

3. After resurfacing the seat, inspect for even valve seating, apply a thin film of compound between the valve face and valve seat, and fit them with valve lapping tool.

4. Check the valve seating with prussian blue. The valve seating surface should show good contact all the way around.

**NOTE**
- After correcting the valve seat, be sure to check the valve recessing.

### 6.1.10 Lapping valve

**IMPORTANT**
- When valve lapping is performed, be sure to check the valve recessing and adjust the valve clearance after assembling the valve.

1. Apply compound evenly to the valve lapping surface.
2. Insert the valve into the valve guide. Lap the valve onto its seat with a valve flapper or screwdriver.
3. After lapping the valve, wash the compound away and apply oil, then repeat valve lapping with oil.
4. Apply prussian blue to the contact surface to check the seated rate. If it is less than 70%, repeat valve lapping again.

### 6.1.11 Checking free length and tilt of valve spring

1. Measure the free length (B) of valve spring with vernier calipers. If the measurement is less than the allowable limit, replace it.

<table>
<thead>
<tr>
<th>Free length (B)</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>31.3 to 31.8 mm</td>
</tr>
<tr>
<td></td>
<td>1.24 to 1.25 in.</td>
</tr>
</tbody>
</table>

| Allowable limit | |
|-----------------| 28.4 mm 1.12 in. |

2. Put the valve spring on a surface plate, place a square on the side of the valve spring.
3. Check to see if the entire side is in contact with the square. Rotate the valve spring and measure the maximum tilt (A). If the measurement exceeds the allowable limit, replace it.

<table>
<thead>
<tr>
<th>Tilt (A)</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1.2 mm 0.047 in.</td>
</tr>
</tbody>
</table>

4. Check the entire surface of the valve spring for scratches. If there is any problem, replace it.

### 6.1.12 Checking valve spring setting load

1. Place the valve spring on a tester and compress it to the same length it is actually compressed in the engine.
2. Read the compression load on the gauge.
3. If the measurement is less than the allowable limit, replace it.

<table>
<thead>
<tr>
<th>Setting load / Setting length</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>65 N / 27.0 mm</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td></td>
<td>15 lbf / 1.06 in.</td>
</tr>
<tr>
<td>Allowable limit</td>
<td>55 N / 27.0 mm</td>
</tr>
<tr>
<td></td>
<td>5.6 kgf / 27.0 mm</td>
</tr>
<tr>
<td></td>
<td>12 lbf / 1.06 in.</td>
</tr>
</tbody>
</table>

6.1.13 Checking oil clearance between rocker arm and rocker arm shaft

1. Measure the rocker arm shaft O.D. with an outside micrometer.

<table>
<thead>
<tr>
<th>Rocker arm shaft O.D.</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>10.473 to 10.484 mm</td>
</tr>
<tr>
<td></td>
<td>0.41233 to 0.41275 in.</td>
</tr>
</tbody>
</table>

2. Measure the rocker arm I.D. with an inside micrometer, and then calculate the oil clearance.

<table>
<thead>
<tr>
<th>Rocker arm I.D.</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>10.500 to 10.518 mm</td>
</tr>
<tr>
<td></td>
<td>0.41339 to 0.41409 in.</td>
</tr>
</tbody>
</table>

3. If the oil clearance exceeds the allowable limit, replace the rocker arm and measure the oil clearance again. If it still exceeds the allowable limit, replace also the rocker arm shaft.

<table>
<thead>
<tr>
<th>Oil clearance between rocker arm and rocker arm shaft</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.016 to 0.045 mm</td>
</tr>
<tr>
<td></td>
<td>0.00063 to 0.0017 in.</td>
</tr>
<tr>
<td>Allowable limit</td>
<td>0.15 mm</td>
</tr>
<tr>
<td></td>
<td>0.0059 in.</td>
</tr>
</tbody>
</table>

6.1.14 Checking push rod alignment

1. Place the push rod on V blocks.
2. Measure the push rod alignment.
3. If the measurement exceeds the allowable limit, replace the push rod.

<table>
<thead>
<tr>
<th>Push rod alignment</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.25 mm</td>
</tr>
<tr>
<td></td>
<td>0.0098 in.</td>
</tr>
</tbody>
</table>

6.1.15 Checking oil clearance between tappet and tappet guide bore

1. Measure the tappet O.D. with an outside micrometer.

<table>
<thead>
<tr>
<th>Tappet O.D.</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>17.966 to 17.984 mm</td>
</tr>
<tr>
<td></td>
<td>0.70733 to 0.70803 in.</td>
</tr>
</tbody>
</table>

2. Measure the I.D. of the tappet guide bore with a cylinder gauge, and calculate the oil clearance.

<table>
<thead>
<tr>
<th>Tappet guide bore I.D.</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>18.000 to 18.018 mm</td>
</tr>
<tr>
<td></td>
<td>0.70867 to 0.70937 in.</td>
</tr>
</tbody>
</table>

SERVICING
6. Servicing
3. If the oil clearance exceeds the allowable limit or the tappet is damaged, replace the tappet.

<table>
<thead>
<tr>
<th>Oil clearance between tappet and tappet guide bore</th>
<th>Factory specification</th>

</tbody>
</table>

6.2 Timing gears, camshaft and governor gear

6.2.1 Checking timing gear backlash

[A] 1. Set a dial indicator (lever type) with its tip on the gear tooth.
2. Move the gear to measure the backlash, holding its mating gear.
3. If the backlash exceeds the allowable limit, check the oil clearance of the shafts and the gear.

<table>
<thead>
<tr>
<th>Backlash between idle gear and crank gear</th>
<th>Factory specification</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.0430 to 0.124 mm</td>
<td>0.15 mm</td>
</tr>
<tr>
<td></td>
<td>0.00170 to 0.00488 in.</td>
<td>0.0059 in.</td>
</tr>
</tbody>
</table>

6.2.2 Checking idle gear 1 side clearance

1. Set a dial indicator with its tip on the idle gear.
2. Measure the side clearance by moving the idle gear to the front and rear.
3. If the measurement exceeds the allowable limit, replace the idle gear collar.

<table>
<thead>
<tr>
<th>Idle gear 1 side clearance</th>
<th>Factory specification</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.20 to 0.51 mm</td>
<td>0.80 mm</td>
</tr>
<tr>
<td></td>
<td>0.0079 to 0.020 in.</td>
<td>0.031 in.</td>
</tr>
</tbody>
</table>

6.2.3 Checking camshaft side clearance

1. Set a dial indicator with its tip on the camshaft.
2. Measure the side clearance by moving the cam gear to the front to rear.
3. If the measurement exceeds the allowable limit, replace the camshaft stopper.

<table>
<thead>
<tr>
<th>Camshaft side clearance</th>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.15 to 0.31 mm</td>
<td>0.50 mm</td>
</tr>
<tr>
<td></td>
<td>0.0059 to 0.012 in.</td>
<td>0.020 in.</td>
</tr>
</tbody>
</table>

4. If the oil clearance is proper, replace the gear.
6.2.4 Checking camshaft alignment

1. Support the camshaft with V blocks on the surface plate at both end journals.
2. Set a dial indicator with its tip on the intermediate journal.
3. Measure the camshaft alignment.
4. If the measurement exceeds the allowable limit, replace the camshaft.

<table>
<thead>
<tr>
<th>Camshaft alignment</th>

<tr>
<td>Allowable limit</td>
<td>0.10 mm</td>
</tr>
<tr>
<td></td>
<td>0.0039 in.</td>
</tr>
</tbody>
</table>

6.2.8 Replacing idle gear bushing

(When removing)
1. Press out the used idle gear bushing using an idle gear bushing replacing tool.

(When installing)
1. Clean a new idle gear bushing and idle gear bore, and apply engine oil to them.
2. Press in a new bushing using an idle gear bushing replacing tool, until it is flush with the end of the idle gear.

6.3 Piston and connecting rod

6.3.1 Checking piston pin bore I.D.
1. Measure the piston pin bore I.D. in both the horizontal and vertical directions with a cylinder gauge.

<table>
<thead>
<tr>
<th>Piston pin bore I.D.</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>20.000 to 20.013 mm</td>
</tr>
<tr>
<td></td>
<td>0.78741 to 0.78791 in.</td>
</tr>
<tr>
<td>Allowable limit</td>
<td>20.05 mm</td>
</tr>
<tr>
<td></td>
<td>0.7894 in.</td>
</tr>
</tbody>
</table>

6.3.2 Checking oil clearance between piston pin and small end bushing

1. Measure the piston pin O.D. where it contacts the bushing with an outside micrometer.

<table>
<thead>
<tr>
<th>Piston pin O.D.</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>20.002 to 20.011 mm</td>
</tr>
<tr>
<td></td>
<td>0.78748 to 0.78783 in.</td>
</tr>
</tbody>
</table>
2. Measure the small end bushing I.D. with an inside micrometer, and calculate the oil clearance.

| Small end bushing I.D. | Factory specification | 20.025 to 20.040 mm 0.78839 to 0.78897 in. |

3. If the oil clearance exceeds the allowable limit, replace the bushing. If it still exceeds the allowable limit, replace the piston pin.

<table>
<thead>
<tr>
<th>Oil clearance between piston pin and small end bushing</th>
<th>Factory specification</th>
<th>0.015 to 0.075 mm 0.00059 to 0.0029 in.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowable limit</td>
<td>0.15 mm 0.0059 in.</td>
<td></td>
</tr>
</tbody>
</table>

### 6.3.3 Replacing small end bushing

1. Press out the used bushing using a small end bushing replacing tool. (See "Special tools").

2. Using a small end bushing replacing tool, press in a new bushing (service parts) being careful to see that the connecting rod oil hole matches the bushing hole.

### 6.3.4 Checking connecting rod alignment

**NOTE**
- Since the I.D. of the connecting rod small end bushing is the basis of this check, check bushing for wear beforehand.

1. Install the piston pin into the connecting rod.
2. Install the connecting rod on the connecting rod alignment tool.
3. Put a gauge over the piston pin, and move it against the face plate.
4. If the gauge does not fit squarely against the face plate, measure the space between the pin of the gauge and the face plate.
5. If the measurement exceeds the allowable limit, replace the connecting rod.

| Connecting rod alignment | Allowable limit | 0.05 mm 0.002 in. |

### 6.3.5 Checking piston ring gap

1. Insert the piston ring into the lower part of the cylinder (the least worn out part) with a piston.
2. Measure the ring gap with a thickness gauge.

3. If the measurement exceeds the allowable limit, replace the piston ring.

<table>
<thead>
<tr>
<th>Piston ring gap</th>
<th>Top ring</th>
<th>Factory specification</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>0.20 to 0.35 mm</td>

</tr>
<tr>
<td></td>
<td></td>
<td>0.0079 to 0.013 in.</td>
<td></td>
</tr>
</tbody>
</table>

6.3.6 Checking clearance between piston ring and piston ring groove
1. Clean the rings and the ring grooves, and install each ring in its groove.
2. Measure the clearance between the ring and the groove with a feeler gauge or depth gauge.

3. If the clearance exceeds the allowable limit, replace the piston ring.

<table>
<thead>

6.5 Cylinder

6.5.1 Checking cylinder wear

1. Measure the I.D. of the cylinder at the six positions (see figure) with a cylinder gauge to find the maximum and minimum I.D.’s.

<table>
<thead>
<tr>
<th>(A) Top</th>
<th>(a) Right-angled to piston pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>(B) Middle</td>
<td>(b) Piston pin direction</td>
</tr>
<tr>
<td>(C) Bottom (Skirt)</td>
<td></td>
</tr>
</tbody>
</table>

2. Get the difference (maximum wear) between the maximum and the minimum I.D.’s.

3. If the wear exceeds the allowable limit, bore and hone to the oversize dimension. (See “Correcting cylinder”.)

4. Visually check the cylinder wall for scratches. If deep scratches are found, the cylinder should be bored. (See “Correcting cylinder”.)

6.5.2 Correcting cylinder (Oversize)

1. When the cylinder is worn beyond the allowable limit, bore and hone it to the specified dimension.

<table>
<thead>
<tr>
<th>Cylinder liner I.D.</th>
<th>Factory specification</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>72.250 to 72.269 mm</td>
<td>72.400 mm</td>

<tr>
<td></td>
<td>2.8445 to 2.8452 in.</td>
<td>2.8504 in.</td>
</tr>
</tbody>
</table>

Finishing Hone to 2.2 to 3.0 μm Rz (87 to 110 μin. Rz)

2. Replace the piston and piston rings with oversize ones.

**Oversize:**

0.25 mm (0.0098 in.)

**Marking:**

025

**NOTE**

- When the oversize cylinder is worn beyond the allowable limit, replace the cylinder block with a new one.
6.6 Oil pump

6.6.1 Checking rotor lobe clearance
1. Measure the clearance between lobes of the inner rotor and the outer rotor with a thickness gauge.

2. If the clearance exceeds the factory specifications, replace the oil pump rotor assembly.

<table>
<thead>
<tr>
<th>Rotor lobe clearance</th>

(17) Needel bearing
(18) Ball bearing
(19) Pump shaft
(20) Cylinder block (Pump)
(21) Charge relief valve
2.1.2 Oil flow of hydrostatic transmission

The pump and motor are joined in a closed hydraulic loop and most of oil circulates within the main oil circuit. A little oil lubricates and oozes out from the clearance between the moving parts of the case. Then oil in the main oil circuit of the HST needs to be supplied a want.

The oil from the power steering circuit flows into the HST for charging. The charge oil aids smooth operation of pistons for pump and motor. The charge oil passes through the oil filter cartridge to charge relief valve port. The rest of oil passes through the charge relief valve into the HST housing. And overflow oil from HST housing return to the transmission case.
2.1.2.1 Neutral position

When the speed control pedal is in neutral, the variable swashplate is not tilted as shown in figure. The pump pistons only rotate with cylinder block without reciprocating. Since the oil is not being pumped to the motor, the cylinder block in the motor is stationary and the output shaft does not move.
2.1.2.2 Forward position

When the speed control pedal is stepped on and in forward, the variable swashplate is tilted as shown in figure. As the pump cylinder block rotates with the input shaft, oil is forced out of pump port B at high pressure. As pressure oil enters motor port D, the pistons, which align with port D, are pushed against the swashplate and slide down the inclined surface.

Then the output shaft rotates with the motor cylinder block. This drives the machine forward and the angle of pump swashplate determines the output shaft speed.

As the motor cylinder block continues to rotate, oil is forced out of motor port C at low pressure and returns to the pump.
2.1.2.3 Reverse position

When the speed control pedal is stepped on and in reverse, the variable swashplate is tilted as shown in figure.

As the pump cylinder block rotates with the input shaft, oil is forced out of pump port A at high pressure. As pressure oil enters motor port C, the pistons, which align with port C, are pushed against the swashplate and slide down the inclined surface.

Then the output shaft rotates with the motor cylinder block. This drives the machine rearward and the angle of pump swashplate determines the output shaft speed.

As the motor cylinder block continues to rotate, oil is forced out of motor port D at low pressure and returns to the pump.

![Diagram of reverse position](image-url)
2.1.2.4 Relief (reverse position)

When the speed control pedal is in reverse, the variable swashplate is tilted as shown in figure.
As the pump cylinder block rotates with the input shaft, oil is forced out of pump port A at high pressure. As pressure oil enters motor port C, the pistons, which align with port C, are pushed against the swashplate and slide down the inclined surface. Since the oil pressure in the check and high pressure relief valve (reverse) increase, the high oil pressure opens the check and high pressure relief valve (reverse) and the flows through the charge relief valve to the transmission case.

Then the output shaft rotates with the motor cylinder block. This drives the machine rearward and the angle of pump swashplate determines the output shaft speed.
As the motor cylinder block continues to rotate, oil is forced out of motor port D at low pressure and returns to the pump.
2.1.3 Structure of HST control linkage

The speed control pedal (4) and the trunnion arm are linked with the HST pedal link (8) and the speed change rod (9). As the front of the pedal is depressed, the swashplate connected to the trunnion arm (2) rotates and forward travelling speed increases. Depressing the rear end increases reverse speed. The trunnion arm (2) is returned to neutral position by the neutral arm and the tension of neutral spring. At the same time, the swashplate is returned to neutral, when the pedal is released. The damper (10) connected to the HST pedal link (8) restricts the movement of the linkage to prevent abrupt operation or reversing. Moreover, the feeling of the dynamic braking can be adjusted by changing the arm (11) position of damper (10).

(Reference)

[A]  Force of the damper is large.

[B]  Force of the damper is small.
2.1.4 Speed set linkage

2.1.4.1 Speed set
When pushing and holding the speed set rod (1) and depressing the speed control pedal (2), the desired speed is set. When pushing the speed set rod (1), the cruise plate (5) is rotated counter clockwise. When depressing the speed control pedal (2) forward, the HST pedal link clockwise. Since both the cruise lock (3) of the cruise plate (5) and the cruise lock (4) of HST pedal link (6) are locked, the speed control pedal (2) is held at a selected position.

2.1.4.2 When brake pedal is depressed

When the brake pedal (2) is depressed, the release plate (1) located under the brake pedal (2) is pushed down. Since the cruise plate (3) rotates, the cruise lock (4) and (6) between the cruise plate (3) and the HST pedal link (5) are released.

2.2 Range gear shift section

2.2.1 Structure of range gear shift

Two kinds of power flow are selected by operating the range gear shift lever to shift the 16T-24T shifter gear (4) on the spiral bevel pinion shaft (3).

**Low range**

17T gear shaft (2) → Shifter gear (24T) (4) → Spiral bevel pinion shaft (3).

**High range**

25T gear (1) → Shifter gear (16T) (4) → Spiral bevel pinion shaft (3).
2.3 Front wheel drive section

2.3.1 Structure of front wheel drive

2-wheel drive or 4-wheel drive is selected by changing the position of 19T shifter gear (2) with the front wheel drive lever.

Front wheel drive "disengaged"
When the front wheel drive lever is set to "disengaged" position, the 19T shifter gear (2) is neutral and power is not transmitted to the front wheel drive shaft (1).

Front wheel drive "engaged"
When the front wheel drive lever is set to "engaged" position, the 19T shifter gear (2) slides to the right to engage with 13T-25T gear shaft (5). Therefore, the power from spiral bevel pinion shaft (3) is transmitted to the front wheel drive shaft (1) through the gears.
2.4 Differential gear section

2.4.1 Structure of differential gears

During straight running
Rotation of the spiral bevel pinion is transmitted to the 37T spiral bevel gear (3), 10T final gear shaft (4), 66T final gear (7) and differential case (1). When road resistance to the right and left wheels are equal, differential pinions (2), (8) and differential side gears (5), (9) all rotate as a unit. Both rear axles received equal input, and both wheels turn at the same speed, allowing the tractor to go straight ahead.
At this time, differential pinions (2), (8) do not rotate around the differential pinion shaft (6).

During turning
When the tractor turns, the road resistance to the inside tire increases. In other words, if one of tires slows down, revolution difference is generated in the differential side gears (5), (9). When rotation of one differential side gear becomes lower than the other, differential pinions (2), (8) begin rotating around differential pinion shaft (6). The other differential side gear is increased in speed by the speed increment of differential pinion shaft (6). This means that rotation of one rear axle is slowed down and that of the other rear axle is increased. Thus, the tractor turn smoothly without power loss.
The combined number of revolutions of the right and left differential side gears is always twice that of the spiral bevel gear (3). When spiral bevel gear revolution is 100 min\(^{-1}\) (rpm), and if one of the differential side gears stops moving, the revolution of the other differential side gear becomes 200 min\(^{-1}\) (rpm) and if one rotates at 50 min\(^{-1}\) (rpm), the other rotates at 150 min\(^{-1}\) (rpm).
(1) Differential case
(2) Differential pinion
(3) 37T spiral bevel gear
(4) 10T final gear shaft
(5) Differential side gear
(6) Differential pinion shaft
(7) 66T final gear
(8) Differential pinion
(9) Differential side gear
2.4.2 Structure of differential lock

When resistance to the right and left tires are greatly different due to ground conditions or type of work, the tire with less resistance slips and prevents the tractor from moving ahead. To compensate for this drawback, the differential lock restricts the differential action and causes both rear axles to rotate as a unit.

When the differential lock pedal is stepped on, it causes the differential lock arm (6) and differential lock shaft (7) to rotate, which will move the differential lock shift fork (8) and the differential lock shifter (2) toward the differential side gear (9). The pins on the differential lock shifter (2) go into the holes in the differential case (3) to cause the differential case (3), differential lock shifter (2) and differential side gear (9) to rotate as a unit.

Therefore, differential pinions (4), (11) are unable to rotate around differential pinion shaft (10) and identical revolutions are transmitted to the right and left rear axle (1), (5).
2.5 Brake section

2.5.1 Structure of brake system

The mechanical wet disc brakes are used for the travelling brake. The brake is operated by the brake pedal (13) through the mechanical linkages and provide stable braking and require little adjustment. The brake body is incorporated in the transmission case and axle cover filled with transmission oil. For greater braking force, four brake discs (11) are provided at the brake shaft, and the friction plates (5) fixed to the transmission case is arranged between the brake discs (11).
Travelling brake
When the brake pedal (13) is depressed, the brake rod (15) pulls the brake cam lever (8). Therefore, the cam plates also move and ride on the steel balls set in the grooves of the transmission case to press the brake disc, the final gear shaft is braked by the frictional force generated by the cam plate and brake disc.

Parking brake
When the parking brake is applied, the brake pedal (13) is locked by the parking brake lock pedal (14).
3. PTO system

3.1 Structure of PTO system

The BX 80 series equipped with hydraulic independent PTO clutch (wet multi-plates type). Therefore, the engine power engages or disengages to the PTO shafts without stopping the tractor movement.

The PTO clutch pack (2) has four clutch discs, four drive plates, pressure plate, clutch piston and so on. The clutch piston is actuated by hydraulic oil flow from the power steering controller.

The PTO clutch valve (5) controls the hydraulic oil flow from power steering controller to the PTO clutch pack (2) by operating the PTO clutch lever through the linkage.
3.1.1 Function of PTO clutch relief valve

The PTO clutch relief valve is provided to control the PTO operating pressure. When the oil pressure exceed the relief valve setting pressure, relief valve opens and the oil flows into PTO clutch and hydrostatic transmission.

3.1.2 Engaged function of PTO clutch

The oil from power steering controller flows into the PTO clutch valve. When the PTO clutch lever is set at the "engaged" position, the PTO clutch valve rotates. Oil flows from the oil line through transmission case to the PTO clutch pack. Oil entering the clutch pack pushes the clutch piston (4) to engage the clutch pack. Power is transmitted from the HST pump shaft (1) through the PTO clutch to the clutch gear (2) and the PTO shafts.

3.1.3 Disengaged function of PTO clutch

When the PTO clutch lever is set at the "disengaged" position, the PTO clutch valve closes the oil passage to the PTO clutch pack. The oil in the PTO clutch pack drain into the transaxle case (10). Thus the clutch piston (4) is pushed back by the spring (7). When the clutch piston (4) is pushed back by the spring (7), the brake plate (11) is also moved to contract the brake disc (12) so as to stop the rotation and drag of the PTO shafts.
3.2 Structure of mid and rear PTO

Three kinds of power flow are selected by operating the PTO select lever to shift the 28T PTO select gear (8) on the 11T gear shaft (9).

**Mid-PTO position "A"**
PTO clutch pack (3) → 12T clutch gear (2) → 28T PTO select gear (8) → 23T mid-PTO gear (5) → 24T mid-PTO idle gear (6) → Mid-PTO shaft (7).

**Rear PTO position "B"**
PTO clutch pack (3) → 12T clutch gear (2) → 28T PTO select gear (8) → 11T gear shaft (9) → Rear PTO shaft (4).

**Mid and rear PTO position**
"A" and "B" at the same time.
4. Others

4.1 Hydraulic pump drive gear section

4.1.1 Structure of hydraulic pump drive gear

The hydraulic pump (7) is mounted to the transmission case (10) and driven by the hydraulic pump drive gear (5). The spline boss (2) mounted on the HST pump shaft drives the hydraulic pump drive gear (5) mounted on the hydraulic pump drive gear shaft (4) through the idle gear (3).

**TIGHTENING TORQUES on page 2-13**
4. Checking and adjusting

4.1 Adjusting maximum speed

**IMPORTANT**
- Speed control pedal should contact with adjusting bolt (A) and / or (B), when depress the speed control pedal fully.

1. Lift up the rear wheels safely by the rigid jacks.
2. Shift the front wheel drive lever to OFF position.
3. Depress the speed control pedal to the forward all the way and lengthen the stopper bolt (for the forward) until it touches the speed control pedal.
4. Adjust the stopper bolt (for the forward) length (A) and lock it securely.
5. Adjust the stopper bolt (for the reverse) length (B) and lock it securely.

**Reference**

| Stopper bolt length | Forward | 17.0 mm  
|---------------------|---------|---------|
|                     |         | 0.669 in.

| Stopper bolt length | Reverse | 17.5 mm  
|---------------------|---------|---------|
|                     |         | 0.689 in.

6. Finally check the traveling speed or rear axle shaft rotation speed.
7. If the measurement is not within the references, check the adjusting bolt length (A), (B).

| Maximum rear axle shaft speed (At engine maximum speed and low range) | Reference | 52.2 min⁻¹  
|-----------------------------------------------------------------------|----------|---------|

4.2 Adjusting HST neutral position

**CAUTION**
- Park the machine on a firm and level ground.

**NOTE**
- When adjusting the HST neutral position, loosen the locking screw approximately 2 turns counterclockwise not to drop the nut inside.
1. Place the wooden blocks at the front and the rear side of the wheels to prevent tractor from moving.
2. Lift up the rear wheels and secure with rigid jacks.
3. Remove the R.H. rear wheel from the tractor.
4. Shift the front wheel drive lever (2) to the 4WD off position (A).
5. Start the engine.
6. Operate the engine at the maximum revolution.
7. Shift the range shift lever (1) to hi position (B).
8. Loosen the locking screw (4).

**Forward to neutral position**
9. Depress the speed control pedal to forward speed position, and release the foot from the speed control pedal. Check that the rear axle (or the wheel) stops rotating. If the rear axle (or the wheel) does not stop rotating, move the position of the locking screw (4) to the machine front side to stop rotating.

**Reverse to neutral position**
10. Depress the speed control pedal to reverse speed position, and release the foot from the speed control pedal. Check the rear axle (or the wheel) stops rotating. If the rear axle (or the wheel) does not stop rotating, adjust the locking screw (4) to stop rotating.

11. After adjusting the neutral position, tighten the locking screw (4) securely.

**4.3 Checking and adjusting HST neutral spring (dynamic braking)**

**WARNING**
- Do not operate if tractor moves on level ground with foot off speed control pedal.
- If tractor moves on level ground with foot off the pedal, or, if the pedal is too slow in returning to neutral position when removing the foot from the pedal, adjust the HST neutral spring.

The HST neutral spring located under the front right side of the fender can adjust returning speed of speed control pedal. Since the HST neutral spring tension is weakened, the HST tension should be checked and adjusted every 100 hours.
Checking the HST neutral spring tension
1. Start the engine and hold the maximum engine speeds.
2. Operate the machine on the concrete level ground.
3. Shift the range gear shift lever to hi position.
4. Depress the speed control pedal to forward.
5. Release the foot from the speed control pedal.
6. Check the distance (L) between the foot releasing point and the machine stopping point.
7. If the distance is more than shown below, strengthen the HST neutral spring tension so that the machine will stop in the specified distance after releasing the foot from the speed control pedal.

<table>
<thead>
<tr>
<th>Distance (L) between the foot releasing point and the machine stopping point</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>3 m</td>
</tr>
<tr>
<td></td>
<td>10 ft.</td>
</tr>
</tbody>
</table>

Adjusting the HST neutral spring tension
1. Remove the step from the machine.
2. Loosen the lock nut (2).
3. Turn the adjusting nut (3) half turn to pull the HST neutral spring (1).
4. Tighten and lock the lock nut (2).
5. Start the engine and check dynamic brake as mentioned former.
6. If the machine will not stop with dynamic brake in the specified distance, adjust the neutral spring again.
   - The feeling of dynamic braking can be adjusted by changing the arm (6) position of damper (5).

4.4 Checking charge relief pressure

**CAUTION**
- When checking, park the tractor on flat ground, and apply the parking brake.
1. Remove the plug (R 1/4) (1) from the front cover, then install the adaptor (R 1/4) and pressure gauge.

2. Set the range gear shift lever to neutral position.
3. Start the engine and operate it at the maximum speed.
4. Read the pressure gauge to measure the charge relief pressure.
5. If the measurement is not within the factory specifications, check the charge relief valve and related hydraulic components.

<table>
<thead>
<tr>
<th>Charge relief pressure</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.55 to 0.75 MPa</td>
<td>5.6 to 7.7 kgf/cm²</td>
</tr>
<tr>

<td>80 to 100 psi</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Oil temperature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>50 °C</td>
<td>122 °F</td>
</tr>
</tbody>
</table>

(When reassembling)

**NOTE**
- When reinstalling the hexagon socket head plug, apply liquid lock (Three Bond 1324 or its equivalent) to the plug.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Charge relief valve checking plug (R 1/4)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>30 to 44 N·m</td>
</tr>
<tr>
<td></td>
<td>3.0 to 4.5 kgf·m</td>
</tr>
<tr>
<td></td>
<td>22 to 32 lbf·ft</td>
</tr>
</tbody>
</table>

4.5 Checking high relief pressure (Forward)

**CAUTION**
- When checking, park the tractor on flat ground, and apply the parking brake.

**IMPORTANT**
- Measure quickly the high relief pressure within about 10 seconds.

<table>
<thead>
<tr>
<th>High relief pressure (Forward) (Oil temperature at 50 °C, 122 °F)</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>20.1 to 21.1 MPa</td>
<td>205 to 215 kgf/cm²</td>
</tr>
<tr>
<td>2920 to 3060 psi</td>
<td>2920 to 3060 psi</td>
</tr>
</tbody>
</table>

(When reassembling)

**NOTE**
- When reinstalling the hexagon socket head plug, apply liquid lock (Three Bond 1324 or its equivalent) to the plug.
4.6 Checking high relief pressure (Reverse)

**CAUTION**
- When checking, park the tractor on flat ground, and apply the parking brake.

**IMPORTANT**
- Measure quickly the high relief pressure within about 10 seconds.

1. Jack up machine.
2. Remove the hexagon socket head plug (R 1/4) from P1 (1), then install the adapter, cable and pressure gauge.
3. Start the engine and operate it at maximum speed.
4. Set the range gear shift lever to hi position.
5. Depress the speed control pedal to reverse, and read the pressure gauge to measure the high relief pressure.
6. If the measurement is not same as factory specification, check the high pressure relief valve and related hydraulic components.

<table>
<thead>
<tr>
<th>High relief pressure (Reverse) (Oil temperature at 50 °C, 122 °F)</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>20.1 to 21.1 MPa</td>
<td>205 to 215 kgf/cm²</td>
</tr>
<tr>
<td>2920 to 3060 psi</td>
<td></td>
</tr>
</tbody>
</table>

(When reassembling)

**NOTE**
- When reinstalling the hexagon socket head plug, apply liquid lock (Three Bond 1324 or its equivalent) to the plug.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Hexagon socket head plug (P1 and P2 port)</th>
</tr>
</thead>
<tbody>
<tr>
<td>30 to 44 N m</td>
<td>3.0 to 4.5 kgf m</td>
</tr>
<tr>
<td>22 to 32 lbf ft</td>
<td></td>
</tr>
</tbody>
</table>

### 4.7 Readjusting relief valve (When HST does not work due to its loose hexagon socket head screw)

**IMPORTANT**
- KUBOTA does not recommend readjusting the relief valve. KUBOTA recommends replacing it with genuine parts.
- As the HST may be damaged if the pressure is set to high by mistake, be careful when adjusting it.

**NOTE**
- The relief pressure is set within the factory specification when shipped from the factory. But, for the purpose of after-sales services, as it is impossible to reset the pressure precisely as set in the factory, its setting range is defined as a slightly wider range within the variable specification.

<table>
<thead>
<tr>
<th>Relief pressure</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>20.1 to 21.1 MPa</td>
<td>205 to 215 kgf/cm²</td>
</tr>
<tr>
<td>2920 to 3060 psi</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Variable specification</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0 to 20.0 MPa</td>
<td></td>
</tr>
<tr>
<td>153 to 203 kgf/cm²</td>
<td></td>
</tr>
<tr>
<td>2180 to 2900 psi</td>
<td></td>
</tr>
</tbody>
</table>
1. Measure the pre-adjustment distance (A).
2. Compress the spring of the relief valve with a relief valve assembling tool (3).
3. Find the distance (A) by turning the poppet (4) with a screwdriver.

<table>
<thead>
<tr>
<th>Distance (A) of relief valve (Forward)</th>
<th>Reference value</th>
</tr>
</thead>
<tbody>
<tr>
<td>39.10 to 39.20 mm / 1.540 to 1.543 in.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Distance (A) of relief valve (Reverse, ø1.5 mm orifice)</th>
<th>Reference value</th>
</tr>
</thead>
<tbody>
<tr>
<td>38.60 to 38.70 mm / 1.520 to 1.523 in.</td>
<td></td>
</tr>
</tbody>
</table>

The distance (A) changes by about 0.5 mm (0.02 in.) per one turn of the poppet (4).

4. Repeat the same operation a few times to find the distance (A) as it is difficult to acquire at the first time.
5. After finding the distance (A), hold the setscrew (6) to a vice and fasten the hexagon socket head screw (2) with specified torque. On this occasion, use a copper plate, etc. for the vice jaws not to damage the setscrew (6).

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Hexagon socket head screw</th>
</tr>
</thead>
<tbody>
<tr>
<td>25 to 29 N·m / 2.5 to 3.0 kgf·m / 18 to 21 lbf·ft</td>
<td></td>
</tr>
</tbody>
</table>

6. Install the relief valve in the HST.
7. Check the relief pressure as indicated in “Checking high relief pressure (Forward)” and “Checking high relief pressure (Reverse)”. The distance (A) is for refresh only. Make sure to check the relief pressure after readjustment.
8. If the relief pressure does not fall within the readjustment pressure range, repeat the processes of the above.

<table>
<thead>
<tr>
<th>Relief valve readjusting pressure</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0 to 20.0 MPa / 153 to 203 kgf/cm² / 2180 to 2900 psi</td>
<td></td>
</tr>
</tbody>
</table>

The pressure changes by 1.5 MPa (15 kgf/cm², 210 psi) per 0.1 mm (0.004 in.) in distance (A).

**4.8 Checking PTO clutch operating pressure**

**CAUTION**
- When checking, park the tractor on flat ground, apply the parking brake.

**IMPORTANT**
- Do not connect the universal joint of the implement to the mid and rear PTO shaft.
1. Lift the rear of the tractor and remove the left rear wheel.
2. Remove the plug (R 1/8), then install the adapter (R 1/8), cable and pressure gauge.
3. Start the engine and set at maximum speed.

**Condition**

<table>
<thead>
<tr>
<th>Engine speed</th>
<th>Oil temperature</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum</td>
<td>45 to 55 °C (113 to 131 °F)</td>
</tr>
</tbody>
</table>

4. Move the PTO clutch lever to Engaged position, and measure the pressure.
5. If the measurement is not same as factory specifications, check the PTO relief valve and related hydraulic components.

<table>
<thead>
<tr>
<th>PTO clutch operating pressure</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1.0 to 1.3 MPa, 11 to 13 kgf/cm², 150 to 180 psi</td>
</tr>
</tbody>
</table>

(When reassembling)

**NOTE**
- When reinstall the hexagon socket head plug, apply liquid lock (Three Bond 1324 or its equivalent) to the plug.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>PTO clutch valve plug (R 1/8)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>13 to 21 N⋅m, 1.3 to 2.2 kgf⋅m, 9.4 to 15 lbf⋅ft</td>
</tr>
</tbody>
</table>

### 4.9 Adjusting brake pedal free travel

**CAUTION**
- Stop the engine, remove the key, lower the implement to the ground, and chock the wheels before checking brake pedal.
- Even if the brake pedal free travel is within the limitation, adjust the brake pedal following the procedure below.

1. Release the parking brake.
2. Loosen the lock nut and turn the turnbuckle to adjust the rod length.
3. Extend the turnbuckle one additional turn.
4. Retighten the lock nut.
5. Depress the brake pedal several times and make sure the brake pedal free travel is correct according to specification.

<table>
<thead>
<tr>
<th>Brake pedal free travel</th>

</tr>
</thead>
<tbody>
<tr>
<td>25 to 35 mm, 1.0 to 1.4 in.</td>
<td></td>
</tr>
</tbody>
</table>

### 5. Disassembling and assembling

#### 5.1 Separating transaxle

#### 5.1.1 Draining transmission fluid

**CAUTION**
- Be sure to stop the engine before checking and changing the transmission fluid.

1. Place oil pan under the tractor.
2. Remove the drain plug (1) at the bottom of the transmission case.

3. Drain the transmission fluid and reinstall the drain plug.

(When refilling)

**IMPORTANT**
- Do not operate the tractor immediately after changing the transmission fluid.
- Operate the engine at medium speed for a few minutes to prevent damage to the transmission.
- Do not mix different brands oil together.
- Fill new oil from filling port after removing the filling plug (2) up to the upper notch on the dipstick (3).

(A) Oil level is acceptable within this range.

- After operating the engine for few minutes, stop it and check the oil level again, if low, add oil to prescribed level.

<table>
<thead>
<tr>
<th>Transmission fluid</th>
<th>Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>11.6 L</td>
</tr>
<tr>
<td></td>
<td>3.1 U.S.gals</td>

<tr>
<td></td>
<td>2.6 Imp.gals</td>
</tr>
</tbody>
</table>

5.1.2 Removing battery

**WARNING**
To avoid serious injury or death:
- When disconnecting the battery cables, disconnect the negative cable from the battery first.
- When connecting, connect the positive cable to the battery first.

1. Remove the under panel (1).

2. Disconnect the negative cable (3) from the battery (2).

3. Disconnect the positive cable (4) from the battery (2) and remove the battery.

5.1.3 Removing lift rod and lower link

1. Remove the top link (2).

RELATED PAGE
LUBRICANTS, FUEL AND COOLANT on page 2-7
2. Remove the stopper pin (6) and remove the check chain plate (3).

3. Move the bushes (8) to inside.
4. Move the shaft (9) to right side and remove the lower link as a unit.

5.1.4 Removing ROPS
1. Disconnect the R.H and L.H. hazard lamp/turn signals (3), (4) from the wire harness.
2. Remove the upper ROPS (1).

5.1.5 Removing seat
1. Disconnect the seat switch connectors.
2. Remove the snap pins (2) to remove the seat (1).

5.1.6 Removing step
1. Disconnect the upper cruise control rod (1) from the lower cruise control rod.
2. Remove the R.H. and L.H. side covers (2), (7).

3. Remove the step mat (3).

4. Remove the forward and reverse HST pedals (5), (6).

5. Remove the step (4).

5.1.7 Removing fender

1. Disconnect the L.H. and R.H. tail lamps (3), (7) from the wire harness.
2. Disconnect the 12 V outlet (2) from the wire harness.

■ NOTE
• 12 V outlet connector is near the L.H. tail lamp connector.

3. Remove the L.H. lever grips (3).

4. Remove the differential lock pedal cover (4), cutting height adjusting dial knob (5), and lower speed adjusting knob (6).

5. Remove the R.H. lever grips (7).

6. Remove the R.H. lever guide (8) and R.H. handrail (10).

7. Remove the L.H. lever guide stay nut.

8. Remove the fender (9).

5.1.8 Removing fuel tank

1. Remove the and R.H. lever guide stay (1).
2. Drain the fuel from the fuel tank.
3. Disconnect the fuel sensor connectors (4) and safety switch connector (7).

4. Remove the fuel tube cover (2).
5. Disconnect the fuel return hose (6) and fuel supply hose (8).
6. Remove the seat stopper (3).
SERVICING
5. Disassembling and assembling
4. TRANSAXLE

7. Remove the R.H. and L.H. fuel tank stays (9) and cushions (10), then remove the fuel tank (5).

(When reassembling)

| Tightening torque | Fuel tank stay mounting bolt and nut | 48 to 55 N·m  
|                  |                                        | 4.9 to 5.7 kgf·m  
|                  |                                        | 36 to 41 lbf·ft |
| Seat stopper bolts |                                    | 123.5 to 147.0 N·m  
|                  |                                        | 12.6 to 15.0 kgf·m  
|                  |                                        | 91.2 to 108 lbf·ft |

5.1.9 Removing rear wheel

1. Remove the rear wheels (1), (2).

(When reassembling)

| Tightening torque | Rear wheel mounting bolt | 109 to 129 N·m  
|                  |                                        | 11.1 to 13.2 kgf·m  
|                  |                                        | 80.3 to 95.4 lbf·ft |

5.1.10 Removing fender center stay

1. Remove the fender center stay (1).

(When reassembling)

| Tightening torque | Hitch plate mounting bolt and nut (M14) | 124 to 147 N·m  
|                  |                                        | 12.6 to 15.0 kgf·m  
|                  |                                        | 91.2 to 108 lbf·ft |
|                  | Fender bracket mounting bolt and nut (M14) | 124 to 147 N·m  
|                  |                                        | 12.6 to 15.0 kgf·m  
|                  |                                        | 91.2 to 108 lbf·ft |

5.1.11 Removing fender bracket and hitch plate

1. Remove the hitch plate (2).
2. Remove the parking brake return spring (4) and the fender brackets (1), (3).

(When reassembling)

- Do not firmly tighten all screws, bolts and nuts until most components are attached.
5.1.12 Removing transaxle assembly

1. Remove the differential lock rod (1) and disconnect the mower link (2).

2. Remove the brake rod (4).

3. Disconnect the hoses (3). (If equipped.)

4. Disconnect the connectors (5).

5. Remove the rear coupling mounting bolt (8).

6. Disconnect the power steering pipes (9) from the transaxle.

7. Remove the speed control rod (7).

8. Remove the wire harness clamps.

9. Remove the frame brackets (10).

| Speed control rod length (7) | Reference value | 373 mm | 14.7 in. |

(When reassembling)

- Tighten the smaller bolt (M12) first.
- Before mounting the transaxle assembly on the tractor main frame, check the flatness of the frame brackets with a straight edge securely.

5.1.13 Removing brake pedal

1. Unhook the spring (2) and remove the parking lock (1).

2. Remove the split pin then remove pin (5) from the brake arm (4).

3. Remove the brake pedal (6).

5.1.14 Removing propeller shaft

1. Disconnect the front coupling (1) from the engine.

2. Remove the propeller shaft assembly.

3. Remove the HST fan (3) from the propeller shaft.

(When reassembling)

- Apply grease to inside of the front coupling and the rear coupling.

<table>
<thead>
<tr>

</tbody>
</table>

5.1.15 Removing differential lock pedal

1. Remove the differential lock return spring (1).

2. Remove the rue ring cotter (3).

3. Turn and remove the differential lock pedal (2).
5.1.16 Removing speed control pedal, HST damper, and cruise rod

1. Remove the speed control pedal (1).
2. Remove the rue ring cotter (4).
3. Remove the HST dumper (2).
4. Remove the cruise arm (6).
5. Remove the cruise rod (5).
6. Remove the spring pin then remove the release arm (7) and cruise plate (9).

(When reassembling)
- Be sure to assemble the cruise spring (8) properly.

5.2 Hydrostatic transmission

5.2.1 Removing levers and mower lift arm

1. Tap out the spring pin from the range gear shift lever (1) and front wheel drive lever (3), then remove the both levers.
2. Remove the hydraulic control lever (2).
3. Remove the PTO select lever (4) and PTO clutch control lever (5).

(When reassembling)
- Apply grease to inside of the front coupling and rear mounting.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
5.2.2 Removing PTO clutch valve

1. Remove the stopper (1).
2. Draw out the PTO clutch valve (2) from the transaxle assembly.

(When reassembling)
1. Clean the oil passages (4).
2. Apply the transmission fluid to the O-rings (3).

5.2.3 Removing oil cooler cover

1. Remove the HST front cover (1) not to damage the oil seal (5).
2. Remove the center section (6).

(When reassembling)
- Do not damage the oil seal (5).
- Tighten the HST mounting bolts and the nut to the factory specifications.

<table>
<thead>
<tr>

5.2.4 Removing center section and valve plates

1. Remove the valve plates (2).
(When reassembling)

1. Check the direction of the groove (3).
2. Install the valve plates (2) to the anchor pins (4) securely.
3. Install the groove of the valve plate (pump plate) to the engine side.

5.2.5 Removing check and high pressure relief valve plug

1. Remove the check and high pressure relief plug (G 1/2).

(When reassembling)

• Be careful not to damage the O-ring (2) on the plug (1).
• Since there is an orifice in the check and relief valve body (reverse) (5), re-install the check and relief valve (4), (5) to their original positions.

<table>
<thead>

5.2.7 Removing cylinder block

1. Remove the gasket (1).

2. Remove the O-ring (2).

3. Remove the cylinder block assembly (4), (5) from the transaxle.

(When reassembling)
- Turn the disassembling and the assembling stand vertically.
- Install the cylinder block assembly (4), (5) to the shafts not to drop the pistons from the cylinder block assembly (4), (5) carefully.

5.2.8 Removing cylinder block and piston

■ NOTE
- Be careful not to damage the surface of the cylinder block and the piston.

1. Remove the piston (3) and the spring (2) from the cylinder block (1).

(When reassembling)
- Apply clean transmission oil to the cylinder block and the piston.
5.2.9 Removing swashplate and trust roller bearing

1. Remove the circlip (6) from the pump shaft (3) and the motor shaft (1).

2. Remove the thrust bearing (2).

3. Remove the swashplate (5) and the thrust roller bearing (4).

(WHEN REASSEMBLING)
- Apply clean transmission oil to the cradle bearing and the trunnion arm.
- Hold the slot guide with a minus screwdriver.
- Apply clean transmission oil to the thrust roller bearing.
5.2.10 Removing 4WD detent ball

1. Remove the 4WD detent bolt (1), the detent spring (2) and the detent ball (3) before removing the transaxle front case, not to drop the detent ball (3) into the transaxle case.

5.2.11 Removing neutral arm and trunnion arm

1. Disconnect the neutral spring (2) from the HST front cover.
2. Loosen the neutral adjuster (5).
3. Remove the external circlip (7).
4. Remove the bolts (1).
5. Remove the neutral adjuster (5) and the neutral arm (3).
6. Remove the trunnion arm (6).

(When reassembling)
- Adjust the HST neutral position. Refer to "Checking and adjusting" section.

5.3 Hydraulic cylinder

5.3.1 Removing hydraulic cylinder
1. Disconnect the delivery pipe (1).

2. Remove the hydraulic cylinder mounting bolts (3).
3. Remove the hydraulic cylinder (2).

(When reassembling)
- Apply liquid gasket (Three Bond 1208D or equivalent) to the joint surface of the transaxle case to the hydraulic cylinder.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Hydraulic cylinder mounting bolt</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

5.4 Transaxle shafts
5.4.1 Removing transaxle case front cover

**NOTE**
- Before removing the transaxle case front cover (4), remove the 4WD detent bolt (1), the detent spring (2) and the detent ball (3) from the transaxle case front cover (4).
- Remove the circlip (5) from the HST pump shaft (PTO shaft) (6) and the HST motor shaft securely.
1. Remove the transaxle case front cover mounting bolts (7).
2. Remove the transaxle case front cover (4) as an unit.

(When reassembling)
• Apply liquid gasket (Three Bond 1208D or equivalent) to the joint surface of the transaxle case to the front cover.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Transaxle case front cover mounting bolt (M10)</th>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>4.0 to 4.4 kgf·m</td>
<td>29 to 32 lbf·ft</td>
</tr>
</tbody>
</table>

5.4.2 Removing hydraulic pump assembly

1. Remove the hydraulic pump assembly mounting bolt (2), (3).
2. Remove the hydraulic pump assembly (1) as an unit from the transaxle case.

(When reassembling)
• Apply transmission oil to the O-rings.
• Since the mounting bolt (2) is installed through the hydraulic pump to the transaxle case, bind the sealing tape to the mounting bolt (2) securely.
5.4.3 Removing rear PTO cover assembly

1. Remove the rear PTO cover mounting bolts (1).
2. Remove the rear PTO cover (2).
3. Remove the rear PTO shaft (5) from the rear PTO cover (2).

(When reassembling)
- Pull the 11T PTO select shaft with the bearing approximately the bearing thickness.
- Apply liquid gasket (Three Bond 1208D or equivalent) to the joint surface of transaxle case to the rear PTO cover.
- Bind the vinyl tape to the rear PTO shaft not to damage the oil seal.

5.4.4 Disassembling rear axle (L.H.)

■ NOTE
- Prepare a specially bent snap ring pillar.
1. Draw out the oil seal with a screw driver.
2. Remove the internal circlip from the rear axle case.
3. Draw out the rear axle from the rear axle case.

(When reassembling)
- Do not damage the oil seal.

5.4.5 Removing rear axle case (R.H.)

1. Remove the rear axle case (R.H.) mounting bolts.
2. Remove the rear axle case (R.H.) (1) as an assembly from the transaxle case.

3. Remove the 37T spiral bevel gear (2).

**NOTE**
- Since the adjusting shims are installed behind the 37T spiral bevel gear, check the shims.

4. Remove the 10T final gear shaft (3).
5. Remove the 66T final gear with the differential lock shift fork.

(When reassembling)
- Apply liquid gasket (Three Bond 1208D or equivalent) to the joint surface of transaxle case to the rear axle case (R.H.).

<table>
<thead>
<tr>
<th>Tightening torque</th>

</tr>
</tbody>
</table>

5.4.6 Removing 66T final gear

1. Remove the bearing (2) with a puller.
2. Remove the bearing (4) with a puller.
3. Remove the differential lock shifter (5) and 66T final gear (6).
4. Put parting marks on the differential pinions (12), (16) and the differential side gears (9), (14).
5. Tap out the differential pinion shaft (8).
6. Remove the differential pinions (12), (16), the differential pinion washers (13), (17), differential side gears (9), (14) and the differential side gear washers (10), (15).

(When reassembling)
• Install the differential pinion and differential gear, aligning the parting marks.
• Lock the differential pinion shaft (8) by setting the key (11).

<table>
<thead>
<tr>
<th>Tightening torque</th>

<tr>
<td>45 to 52 lbf ft</td>
<td></td>
</tr>
</tbody>
</table>

5.4.7 Removing rear axle case, R.H. and brake

1. Remove the internal circlip (1).
2. Remove the shim (9), the bearing holder (8) and the other brake parts from the brake case.

(When reassembling)
• Apply grease to the steel balls.
• Be careful not to damage the O-ring on the brake cam lever.
• Check that the brake cam lever moves smoothly.
5.4.8 Removing PTO clutch assembly

1. Remove the bearing (2).
2. Remove the external circlip and the clutch gear (3).
3. Remove the seal rings (6).
4. Remove the bearing (5).
5. Remove the external circlip (18) using a clutch spring compressor.
6. Disassembling the clutch pack inner parts as show in the figure.

(When reassembling)
- Change the seal rings (6) with a new one.

5.5 Assembling shafts

5.5.1 Assembling select arms and HST pump shaft (PTO clutch shaft)
- Be careful not to damage the O-rings on the arms.
1. Install the PTO select arm (1).

2. Install the range shift arm (2) and the front wheel drive shift arm (3).

3. Install the idle gear shaft.

**NOTE**
- Install the rear PTO cover and the PTO select gear shaft before installing HST pump shaft assembly.

4. After installing the rear PTO cover to the transaxle case, install the PTO select gear shaft (6).

5. Install the HST pump shaft (PTO clutch shaft) (5).

### 5.5.2 Assembling front wheel drive shaft, shifter, spiral bevel pinion shaft and mid-PTO shaft

1. Install the front wheel drive shaft (1).

2. Install the shifter (2) and the spiral bevel pinion shaft (3) together.
3. Install the mid-PTO idle gear shaft (5) and the mid-PTO shaft (6) and the HST motor shaft (4) together.

6. Servicing

6.1 Hydrostatic transmission

6.1.1 Checking center section

1. Check the center section surface (1) for scratches or wear.

2. If deep scratch or excessive wear is found, replace the hydrostatic transmission assembly.

6.1.2 Checking charge relief valve

1. Check the charge relief valve (1) and the spring (2).

2. If damages are found, replace it.

6.1.3 Checking check and high pressure relief valve

■ NOTE
- Check and high pressure relief valve (reverse) has a pin hole.

<table>
<thead>
<tr>
<th>Pin hole</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.5 mm</td>
<td>0.059 in.</td>
</tr>
</tbody>
</table>

1. Check the check and high pressure relief valve (4), (5) for scratches and damage.

2. Check the spring (3) for breakage and wear.

3. If anything are unusual, replace the check and high pressure relief valve as complete assembly.
6.1.4 Checking cylinder block assembly

**IMPORTANT**
- Do not interchange the pistons between the pump cylinder block and the motor cylinder block. Pistons and cylinder blocks are matched.

1. Check the cylinder blocks (1) and the pistons (2) for scratches and wear.
2. If there are scratch or worn, replace the cylinder block assembly.
3. Check the pistons for their free movement in the cylinder block bores.
4. If the piston or the cylinder block is scored, replace the cylinder block assembly.
5. Check the polished face (4) of the cylinder block for scoring. If it is scored, replace the cylinder block assembly.

6.1.5 Checking thrust washer, thrust roller bearing, thrust plate and cradle bearing

1. Check the thrust bearing (3) for scratches and excessive wear.
2. If it is worn, replace it.
3. Check the thrust plate (4) for scratches and excessive wear. If it is worn or scored, replace it.
4. Check the cradle bearing (5) for excessive wear. If it is worn, replace it.

6.1.6 Checking pump shaft (PTO clutch shaft)

1. Check the seal surface (1) and the bearing surface (2).
2. If the pump shaft is rough or grooved, replace it.
3. If the ball bearing or the needle bearing is worn, replace it.
6.1.7 Checking needle bearing

1. Check the needle bearing (1) for wear.
2. If the needle bearing (1) are worn, replace them.

6.2 Transaxle case
6.2.1 Checking bearing

1. Hold the inner race, and push and pull the outer race in all directions to check wear and roughness.
2. Apply the transmission oil to the bearing, and hold the inner race.
3. Turn the outer race to check rotation.
4. If there are any damaged, replace the bearing.

6.2.2 Checking PTO clutch disc wear

1. Measure the thickness of PTO clutch disc with vernier calipers.
2. If the thickness is less than the allowable limit, replace it.

<table>
<thead>
<tr>
<th>Thickness of PTO clutch disc</th>
<th>Factory specification</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>

6.2.12 Checking brake cam lever movement

1. Move the brake cam lever by hand to check its movement.
2. If its movement is heavy, refine the brake cam with a emery paper.

6.2.13 Checking flatness of actuator and bearing holder

1. Place a straightedge on the contacting surface of the actuator and the bearing holder.
2. Inspect the friction surface of the actuator and the bearing holder with the straightedge, and determine if a feeler gauge will fit on the part of wear.
3. If it will fit, resurface.
6.2.14 Checking height of cam plate and ball

1. Measure the height of the cam plate with the ball installed.

2. If the measurement is less than the allowable limit, replace the cam plate and balls.

3. Inspect the ball holes of cam plate for uneven wear.
4. If the uneven wear is found, replace it.

</tr>
</tbody>
</table>
5. FRONT AXLE
MECHANISM

1. Structure of front axle

The front axle of the 4WD is constructed as shown below. Power is transmitted from the transmission through the propeller shaft to the bevel pinion shaft (9), then to the bevel gear (15) and to the differential side gear (13).

The power through the differential side gear is transmitted to the differential yoke shaft (7), (12), and to the bevel gear shaft (16) through the bevel gears (4), (6) in the bevel gear case (5).

The revolution is greatly reduced by the bevel gears (18), (3), then the power is transmitted to the axle (1). The differential system allows each wheel to rotate at a different speed to make turning easier.
2. Front wheel alignment

To assure smooth mobility or maneuverability and enhance stable and straight running, the front wheels are mounted at an angle to the right, left and forward directions. This arrangement is referred to as the Front Wheel Alignment.

2.1 Camber of front axle

The front wheels are tilted from the vertical as viewed from the front. Upper wheels are sooner than lower ones. This inclination is called camber (a). Camber reduces bending or twisting of the front axle caused by vertical load or running resistance, and also keeps the stability in running.

<table>
<thead>
<tr>
<th>Camber</th>
<th>0.035 rad</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2°</td>
</tr>
</tbody>
</table>

2.2 Kingpin angle of front axle

The kingpin is titled forward as viewed from the front. This angle is called kingpin angle (a). As with the camber, kingpin angle reduces rolling resistance of the wheels, and prevents any shimmy motion of the steering wheel. It also reduces steering effort.

<table>
<thead>
<tr>
<th>Kingpin angle</th>
<th>0.209 rad</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>12°</td>
</tr>
</tbody>
</table>

2.3 Caster of front axle

The kingpin is tilted forward as viewed from the side. The point (b) of the wheel center line is behind the point (a) of the kingpin shaft center line. This inclination is called caster (c). Caster helps provide steering stability. As with the kingpin inclination, caster reduces steering effort.

<table>
<thead>
<tr>
<th>Caster</th>
<th>0 rad</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0°</td>
</tr>
</tbody>
</table>

2.4 Toe-in of front axle

Viewing the front wheels from above reveals that the distance between the toes of the front wheels is smaller than that between the heels. It is called toe-in. The front wheels tend to roll outward due to the camber, but toe-in offsets it and ensures parallel rolling of the front wheels. Another purpose of toe-in is to prevent excessive and uneven wear of tires.

<table>
<thead>
<tr>
<th>Toe-in</th>

--- RELATED PAGE ---

TIGHTENING TORQUES on page 2-13
4. Checking and adjusting

4.1 Adjusting toe-in

1. Inflate the tires to the specified pressure.
2. Turn the front wheels straight ahead.
3. Measure the toe-in ((B) - (A)).
4. If the measurement is not within the factory specifications, adjust the tie-rod length.

Adjusting procedure
1. Loosen the lock nuts and turn the tie-rod to adjust the rod length until the proper toe-in measurement is obtained.
2. Re-tighten the lock nuts.

4.2 Adjusting front axle rocking force

1. Jack up the front side of tractor and remove the front wheel.
2. Set a spring balance to the front gear case cover.
3. Measure the front axle rocking force.
4. If the measurement is not within the factory specifications, adjust as following.

<table>
<thead>
<tr>
<th>Front axle rocking force</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>49.0 to 300 N</td>
</tr>
<tr>
<td></td>
<td>5.00 to 30.5 kgf</td>
</tr>
<tr>
<td></td>
<td>11.1 to 67.4 lbf</td>
</tr>
</tbody>
</table>

Adjusting procedure
a. Remove the cotter pin (1).
b. Tighten or loosen the adjusting nut (2) so that the measurement of rocking force comes to factory specifications.
c. If the slot and pin hole do not meet, align the nut until they do meet within factory specifications.
d. Install the new cotter pin.

(When reassembling)
- Be sure to split the cotter pin like an anchor.
4.3 Adjusting front wheel steering angle

(1) Stopper bolt L.H.  (2) Lock nut

(Reference)

<table>
<thead>
<tr>
<th>Steering angle</th>
<th>Right side</th>
<th>0.84 to 0.87 rad 48 to 50°</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

<th>23 mm 0.91 in.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Left side</td>
<td>16 mm 0.63 in.</td>
</tr>
</tbody>
</table>

1. Inflate the tires to the specified pressure.
2. Loosen the lock nut and shorten the length of stopper bolt L.H. (1).
3. Steer the wheels to the extreme left.
4. Lengthen the length of stopper bolt (1) until the stopper bolt contacts with the bevel gear case (3).
5. Return the steering wheel to straight ahead and lengthen the stopper bolt 1/2 turns from above position further.
6. Lock the stopper bolt by lock nut (2).
7. For adjusting the right steering angle, perform the same procedure as mentioned in left steering angle.

5. Disassembling and assembling

5.1 Separating front axle assembly

5.1.1 Draining front axle case oil

(1) Breather plug  (A) Oil level is acceptable within this range.
(2) Filling plug with dipstick
(3) Drain plug

1. Place the oil pans underneath the front axle case.
2. Remove both right and left hand side drain plugs (3) and filling plug (2) to drain the oil.
3. After draining, reinstall the drain plugs (3).

(When reassembling)

**IMPORTANT**
- After a few minutes, check the oil level again, add oil to prescribed level.
- When re-filling, remove the right and left breather plugs (1).

5.1.2 Removing battery

**WARNING**
To avoid serious injury or death:
- When disconnecting the battery cables, disconnect the negative cable from the battery first.
- When connecting, connect the positive cable to the battery first.
1. Remove the under panel (1).
2. Disconnect the negative cable (3) from the battery (2).
3. Disconnect the positive cable (4) from the battery (2) and remove the battery.

5. FRONT AXLE

5.1.3 Removing bonnet

1. Remove the front guard (3).
2. Open the bonnet.
3. Disconnect the headlight harness from the headlamps and bonnet.
4. Disconnect the bonnet guide rod from the bonnet.
5. Disconnect the L.H. and R.H. bonnet brackets (2) from the frame.
6. Remove the bonnet (1).

5.1.4 Removing front wheel and propeller shaft cover

1. Lift up the front of tractor and place the disassembling stand under the front axle frame.
2. Remove the front wheels.
3. Remove the propeller shaft cover mounting bolt and slide the propeller shaft cover (1).

5.1.5 Disconnecting propeller shaft

1. Tap out the spring pins (2) and disconnect the universal joint (1) and spiral bevel pinion shaft.

KiSC issued 03, 2017 A
5.1.6 Removing front axle assembly

1. Remove the power steering hose clamp (1).
2. Place the garage jack under the front axle.
3. Remove the cotter pin (3).
4. Remove the slotted nut (2) of center pin and separate the front axle from the frame.
5. Disconnect the power steering hoses (4).

(When reassembling)
- Apply grease to the splines of the propeller shaft and universal joint.

(When reassembling)
- After mounting the front axle assembly to the frame, be sure to adjust the front axle rocking force.
- Installing the cotter pin, be sure to split the cotter pin like an anchor.

5.2 Front axle assembly

5.2.1 Removing power steering cylinder

1. Remove the cotter pin and remove the slotted nut for tie-rod (1).
2. Remove the power steering cylinder mounting screws and remove the power steering cylinder (2) with tie-rod.

(When reassembling)

**NOTE**
- Tighten the slotted nut. If the slot and pin hole do not meet, tighten the nut until they do meet, and install the cotter pin.
- Be sure to split the cotter pin like an anchor.
5. FRONT AXLE

5.2.2 Removing bevel gear case and front gear case

1. Remove the bevel gear case mounting screws.
2. Remove the bevel gear case (2) and front gear case (1) as a unit from the front axle case (3).

(When reassembling)
- Apply grease to the O-ring and be careful not to damage it.
- Do not interchange right and left bevel gear case assemblies and right and left gear case assemblies.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

5.2.3 Removing front gear case cover

1. Remove the front gear case mounting screws and remove the front gear case cover (1) with bevel gear (2).

(When reassembling)
- Apply grease to the O-ring and be careful not to damage it.

| Tightening torque | Front gear case cover mounting screw | 48 to 55 N·m | 9.0 to 9.3 kgf·m | 69 to 74 lbf·ft |
5.2.4 Removing 36T bevel gear and front axle shaft

1. Remove the ball bearing (5).
2. Remove the 36T bevel gear (4).
3. Remove the collar (3).
4. Tap out the axle shaft (2).

(When reassembling)
- Install the oil seal (6) of front gear case cover (1), noting its direction as shown in the figure.

5.2.5 Removing front gear case and bevel gear case

1. Remove the internal snap ring (1).
2. Remove the bevel gear with ball bearing (3) and shim (2).
3. Remove the bevel gear (4).
4. Remove the external snap ring (7).
5. Remove the bevel gear case (5) from front gear case (6).
6. Remove the oil seal (12) and the ball bearing (11).
7. Remove the internal snap ring (10) and remove the ball bearing (9).
8. Remove the bevel gear shaft (8) with ball bearing.

(When reassembling)
- Install the oil seal (12) of bevel gear case, noting its direction as shown in the figure.
5. FRONT AXLE

5.2.6 Removing bevel pinion shaft and differential gear assembly

1. Remove the differential yoke shaft (4), (7).
2. Remove the oil seal (11).
3. Remove the internal snap ring (1).
4. Pull out the bevel pinion shaft (3).
5. Remove the differential gear assembly (5), from right side of front axle case (6).
6. Remove the stake of lock nut (10), and then remove the lock nut (10).
7. Remove the taper roller bearing (9).

(When reassembling)

- Apply gear oil to the taper roller bearings (9) and install them correctly, noting their direction.
- Replace the lock nut (10) and oil seal (11) with new ones.
- After tighten the lock nut (10) to the specified torque, stake it firmly.
- Install the adjusting collars (2), (8) to their original position.

5.2.7 Removing differential gear

■ NOTE

- Arrange the parts to know their original position.
1. Remove the bevel gear (5) with bearing (6) and ball bearing (9) by puller.
2. Remove the spring pin (10).
3. Remove the differential pinion shaft (8).
4. Remove the differential pinions (2), differential side gears (4) and shims (1), (3).

(When reassembling)
* Apply molybdenum disulfide (Three Bond 1901 or equivalent) to the inner circumferential surface of the differential side gears, differential pinions and shims.

### 6. Servicing

#### 6.1 Checking clearance between differential case and differential side gear

1. Measure the differential side gear boss O.D.
2. Measure the differential case bore I.D., and calculate the clearance.

#### 6.2 Checking clearance between differential pinion shaft and differential pinion

1. Measure the differential pinion shaft O.D.
2. Measure the differential pinion I.D., and calculate the clearance.
3. If the clearance exceeds the allowable limit, replace damaged parts.
6.3 Checking backlash between differential pinion and differential side gear

1. Set a dial gauge (lever type) on a tooth of the differential pinion.
2. Fix the differential side gear, and move the differential pinion to measure the backlash.
3. If the measurement exceeds the factory specifications, adjust with the differential side gears shims.

<table>
<thead>
<tr>

|                              |               | 0.154 in.  |

6.4 Checking turning torque of bevel pinion shaft

1. Clamp the spiral bevel pinion shaft assembly to the vise and tighten the staking nut.
2. Measure the turning torque of bevel pinion shaft.
3. If the turning torque is not within the factory specifications, adjust with the lock nut.

**NOTE**
- After turning force adjustment, be sure to stake the lock nut.

<table>
<thead>
<tr>

6.5 Checking backlash between bevel pinion shaft and bevel gear

1. Put the wire of solder or plastigauge on the position where the tooth proper contact of bevel pinion shaft.

<table>
<thead>
<tr>
<th>Wire of solder</th>
<th>Factory specification</th>
<th>Thickness 0.5 mm 0.02 in.</th>
</tr>
</thead>
</table>

2. Fix the bevel gear and rotate the bevel pinion shaft carefully.
3. Measure the backlash.
4. If the backlash is not within the factory specifications, change the adjusting collar (3) and (4).

<table>
<thead>
<tr>
<th>Backlash between bevel pinion shaft and bevel gear</th>
<th>Factory specification</th>
<th>0.1 to 0.3 mm 0.004 to 0.01 in.</th>
</tr>
</thead>
</table>

5. Adjust the backlash properly by repeating the above procedures.

6.6 Checking backlash between 12T bevel gear and 15T bevel gear

1. Stick a strip of wire of solder or plastigauge to three spots on the 15T bevel gear (1) with grease.
2. Fix the front axle case, bevel gear case and front gear case.
3. Turn the axle.
4. Remove the bevel gear case from front axle case and measure the backlash.
5. If the backlash is not within the factory specifications, adjust with shim (3).

<table>
<thead>
<tr>

6. STEERING
1. Structure of steering system

This model is provided with a full hydrostatic power steering. This steering system consists of a hydraulic pump (1), steering cylinder (2), steering controller (3), etc. In the full hydrostatic power steering, the steering controller (3) is connected to the steering cylinder (2) with only the hydraulic hoses. This steering is actuated by oil pressure. Accordingly, it does not have mechanical transmitting parts such as steering gear, pitman arm, drag link, etc. Therefore, it is simple in construction.
2. Hydraulic circuit of steering

The steering circuit consists of a steering controller (1), steering cylinder (2), flow priority valve (3), hydraulic control valve assembly (4), hydraulic pump (5), and oil strainer (6).

Oil is supplied from the oil strainer by the hydraulic pump to the flow priority valve. The flow priority valve then divides the oil into two directions. The priority direction is to control the oil flow to the power steering at a fixed control rate. The secondary direction is excessive flow to the control valve of the implement lift circuit.

The oil that is supplied to the steering system gets transferred to the steering controller. When the steering wheel is turned, the steering controller then transfers oil to the steering cylinder.

<table>
<thead>
<tr>
<th>Oil flow rate</th>
<th>Flow priority valve</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0 L/min.</td>
<td></td>
</tr>
<tr>
<td>2.1 U.S.gals/min.</td>
<td></td>
</tr>
<tr>
<td>1.8 Imp.gals/min.</td>
<td></td>
</tr>
</tbody>
</table>
3. Steering controller

3.1 Structure of steering controller

The steering controller consists of a control valve (4), metering device (3), and relief valve (1).

3.1.1 Control valve

3.1.1.1 Structure of control valve

The control valve is a rotating spool type. When the steering wheel is not turned, the position of the spool (7) and sleeve (9) is kept neutral by the centering spring (8). This causes the forming of a "neutral" oil circuit.

When the steering wheel is turned either clockwise or counterclockwise, the position of the spool and sleeve changes in relation to the centering spring (8). This allows the forming of a "right turning" or "left turning" oil circuit. At the same time, the gear pump (metering device) rotates with the spool and sends the oil to the cylinder corresponding to the rotation of the steering wheel.

3.1.2 Metering device

3.1.2.1 Structure of metering device

Oil sent from the hydraulic pump to the steering cylinder, passes through the metering device. Namely, when the rotor is driven, two chambers suck in oil due to volumetric change in the pump chambers formed between the rotor (12) and the stator (13), while oil is discharged from other two chambers. On the other hand, rotation of the steering wheel is directly transmitted to the rotor through the spool, drive shaft (10), etc.

3.1.2.2 Function of metering device

The metering device serves to supply the steering cylinder with oil, amount of which corresponds to the rotation of the steering wheel. The wheels are thus turned by the angle corresponding to the rotation of the steering wheel. When the engine stops or the hydraulic pump malfunctions, the metering device functions as a manual trochoid pump, which makes manual steering possible.
3.1.3 Relief valve

3.1.3.1 Function of relief valve

The relief valve is located in the steering controller. It controls the maximum pressure of the power steering system.

3.1.3.2 Specification of relief valve

The setting pressure for the relief valve is as follows.

<table>
<thead>
<tr>
<th>Relief valve</th>
<th>Operating pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>8.33 to 8.83 MPa</td>
</tr>
<tr>
<td></td>
<td>85 to 90 kgf/cm²</td>
</tr>
<tr>
<td></td>
<td>1209 to 1280 psi</td>
</tr>
</tbody>
</table>
4. Steering cylinder

4.1 Structure of steering cylinder

The steering cylinder is single piston both rod double-acting type. This steering cylinder is installed parallel to the front axle and connected to tie-rods. The tie-rods connected to both knuckle arm guarantees equal steering movement to both front wheels. The steering cylinder provides force in both directions. Depending upon direction the steering wheel is turned pressure oil enters at one end of the cylinder to extend, or the other end to retract it, thereby turning front wheel of the tractor.

4. Checking and adjusting

4.1 Checking relief valve operating pressure

**NOTE**
- After setting a pressure gauge, be sure to bleed air.
- Note that the pressure value changes by the pump action of the power steering controller when the steering operation is continued after the steering wheel is lightly locked and accurate relief valve pressure cannot be measured.

1. Disconnect the power steering hose L (or R) from steering controller, and set a pressure gauge and hose.

**(Reference)**

| Hose and adapter size | 9/16-18 UNF, 37° flare |

2. Start the engine and set at maximum speed.
3. Fully turn the steering wheel to the left (or right) to check the feeling which the steering wheel lightly locks. Read the relief valve operating pressure when the steering wheel to the above-mentioned lock position by operation force.

<table>
<thead>
<tr>

5. Disassembling and assembling

5.1 Power steering cylinder

5.1.1 Removing adapter and tie-rod

1. Remove the cylinder hose adapters (4), (6).
2. Remove the tie-rods (2), (8) from piston rod (7).
3. Remove the cylinder holder (1) and internal snap ring (3).

**(When reassembling)**
- Be sure to install the hose adapters (4), (6).

![Diagram](image)

- After reassembling the tie-rod, be sure to adjust the toe-in.

<table>
<thead>
<tr>
<th>Tightening torque</th>

</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>7.5 to 8.6 kgf m</td>
</tr>
<tr>
<td></td>
<td></td>
<td>55 to 62 lbf ft</td>
</tr>
</tbody>
</table>
5.1.2 Disassembling steering cylinder

1. Carefully clamp the cylinder in a vise.
2. Push one of the guide assembly (3) to inside of cylinder tube (2).
3. Drill a hole on the cylinder tube (2) just over the snap ring (4).

<table>
<thead>
<tr>
<th>Hole</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2.5 mm diameter 0.098 in. diameter</td>
</tr>
</tbody>
</table>

4. Take a little screwdriver and lift off the snap ring (4) from its groove. Simultaneousness support this action by pushing from the outside of the cylinder tube with another little screwdriver or another tool.
5. Push out the piston rod assembly (9) and take off the guide assembly (3).

(When reassembling)

- **NOTE**
  - Seals must be exchanged after disassembling.
  - Apply transmission fluid to the exchanged seals.
  - Enter the piston rod and block the guide assemblies with the snap rings.

5.2 Separating power steering controller

5.2.1 Removing battery

**WARNING**
To avoid serious injury or death:
- When disconnecting the battery cables, disconnect the negative cable from the battery first.
- When connecting, connect the positive cable to the battery first.

1. Remove the under panel (1).
2. Disconnect the negative cable (3) from the battery (2).
3. Disconnect the positive cable (4) from the battery (2) and remove the battery.
5.2.2 Removing steering wheel
1. Remove the steering wheel cap (1).
2. Remove the steering wheel mounting nut and remove the steering wheel (2).

(When reassembling)

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Steering wheel mounting nut</th>
</tr>
</thead>
<tbody>
<tr>
<td>20 to 25 N·m</td>
<td>2.0 to 2.6 kgf·m</td>
</tr>
<tr>
<td>15 to 18 lbf·ft</td>
<td>21 to 25 N·m</td>
</tr>
</tbody>
</table>

5.2.3 Removing upper panel
1. Disconnect the main switch (2) and combination switch (5).
2. Remove the hand accelerator lever grip (1), cruise control lever knob (3), and tilt lever grip (4).

(When reassembling)

- Be sure to connect the power steering hoses to their original position, and tighten them to the specified torque.

3. Open the bonnet, and remove the upper panel mounting bolts (6).
4. Remove the upper panel (7).

5.2.4 Removing steering controller
1. Disconnect the power steering hoses (3), (4), (5), (6) from the steering controller (1).

2. Remove the steering controller mounting screws (9) and remove the steering controller.
5.3 Separating power steering cylinder

5.3.1 Removing bonnet

1. Remove the front guard (3).
2. Open the bonnet.
3. Disconnect the headlight harness from the headlights and bonnet.
4. Disconnect the bonnet guide rod from the bonnet.
5. Disconnect the L.H. and R.H. bonnet brackets (2) from the frame.
6. Remove the bonnet (1).

5.3.2 Removing front axle assembly

1. Remove the power steering hose clamp (1).

(When reassembling)
- After mounting the front axle assembly to the frame, be sure to adjust the front axle rocking force.
- Installing the cotter pin, be sure to split the cotter pin like an anchor.
### 5.3.3 Removing power steering cylinder

1. Remove the cotter pin and remove the slotted nut for tie-rod (1).
2. Remove the power steering cylinder mounting screws and remove the power steering cylinder (2) with tie-rod.

#### (When reassembling)

**NOTE**
- Tighten the slotted nut. If the slot and pin hole do not meet, tighten the nut until they do meet, and install the cotter pin.
- Be sure to split the cotter pin like an anchor.

### 6. Servicing

#### 6.1 Checking steering cylinder I.D.

1. Measure the steering cylinder I.D. with a cylinder gauge.

### 6.2 Checking clearance between rod and guide

1. Measure the rod guide I.D. with a cylinder gauge.
2. Measure the rod O.D. with an outside micrometer, and calculate the clearance.
3. If the clearance exceeds the allowable limit, replace as a unit.
7. HYDRAULIC SYSTEM
1. Structure of hydraulic system

The hydraulic system of this tractor consists of hydrostatic transmission, hydraulic pump, 3 point hitch and power steering.

1. MECHANISM

2. Diagram

(1) Power steering controller
(2) Front loader control valve
(3) Hydraulic block
(4) Flow priority valve
(5) Hydraulic pump
(6) Hydrostatic transmission (HST)
(7) Steering cylinder
2. Hydraulic circuit

The hydraulic system of this tractor consists of a hydraulic pump, control valve for front loader, 3 point hitch system and other components.

This system has the following functions:

1. Oil is supplied by hydraulic pump which is driven by pump drive shaft in the transmission case. As the pump drive shaft is connected to the propeller shaft, hydraulic pump starts running when engine is started.

2. The hydraulic pump supplies the high pressured oil to auxiliary hydraulic control valve for front loader, control valve for 3 point hitch system, power steering controller, PTO clutch valve and hydrostatic transmission after dividing oil flow by flow priority valve.
### Operating pressure and oil flow

3. Hydraulic pump

3.1 Outline of hydraulic pump

This hydraulic pump is located on left side of transmission. Hydraulic pump is driven by the pump drive shaft in the transmission case.

3.2 Structure of hydraulic pump

The hydraulic pump consists of the casing (1), cover (4), side plate (3), and two spur gears (drive gear (5) and driven gear (2)) that are in mesh.

3.3 Specification of hydraulic pump

Maximum displacement of hydraulic pump is as follows.

<table>
<thead>
<tr>

4. Control valve

4.1 Outline of control valve

This position control valve is located under the hydraulic cylinder. This control valve is mechanically connected to the position control lever. Since the feedback rod is not equipped to the lift arm, the neutral position adjustment is adjusted by controlling the position control lever. The control valve controls the oil flow forced from the hydraulic pump and the oil returned back from the hydraulic cylinder.
4.2 Function of control valve

4.2.1 Control valve in neutral position

When you stop the position control lever, the spool is stopped. The spool closes the oil flow from passage between P port and C port. Since the oil in the hydraulic cylinder is not drained to T2 port, neutral position is kept.
4.2.2 Control valve in lift position

When the control lever is set to the lift position, the spool (4) moves to the right. The oil forced into the control valve flows through P port to C port and the hydraulic cylinder. The oil pushes the hydraulic piston in the hydraulic cylinder to lift the implement. Since the spool shape is step down structure, oil passes slowly through the gap between the control valve body (3) and the spool (4) to C port.

In this tractor, when you set the control lever to the slow up, implement lifts up with ease in increments of approximately 1/4 inches at lower link end.

![Diagram of control valve in lift position]
4.2.3 Control valve in down position

When the control lever is set to the down position, the spool (4) moves to the left. The oil forced from the P port flows through the gap between the control valve body and the spool to the T1 port. The oil in the hydraulic cylinder flows through the gap between the control valve body (3) and the spool (4) to the T2 port.

Since the oil in the hydraulic cylinder drains to the transmission case, the implement lowers. Since the spool shape is step down structure, oil pass slowly from C port through the gap between the control valve body (3) and the spool (4) to T2 port.

In this tractor, when you set the control lever to the slow down position, implement lowers down with ease in increments of approximately 1/4 inches at lower link end.
5. Flow priority valve

5.1 Outline of flow priority valve

This flow priority valve is located to the left side of the transmission. The flow priority valve is a flow divider that divides a single hydraulic source (hydraulic pump) into two circuits and actuates them simultaneously.
5.2 Structure of flow priority valve

The structure of the flow priority valve is as follows.

(1) Hydraulic pump gear
(2) Hydraulic pump case
(3) Plug
(4) Flow priority valve
(5) Relief valve

EF: EF port (to 3 point hitch control circuit)
PF: PF port (to power steering, PTO clutch and HST circuit)
P: Pump port (Suction)
T: Tank port
5.3 Specification of flow priority valve

The oil flow of the priority valve is as follows.

<table>
<thead>
<tr>
<th>Power steering oil flow</th>
<th>Engine speed</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Above 8.0 L/min. 2.1 U.S.gals/min. 1.8 Imp.gals/min.</td>
<td>At 1500 min⁻¹ (rpm)</td>
<td>At no load</td>
</tr>
</tbody>
</table>

6. Relief valve

6.1 Outline of relief valve

This relief valve is located on the left side of transmission. The implement control system circuit has a relief valve to restrict the maximum pressure in the circuit. The relief valve is a guide piston type with damping effect.
6.2 Structure of relief valve

Among direct acting relief valves, this type is suited to higher pressure and has large capacity. Furthermore, this type is free from unstable operation, such as chattering, which occurs often in direct acting relief valves.

As shown in the figure, the guide is attached to the poppet (7) and a valve chamber D.C. (called the damping chamber) is formed at the top of the guide piston. The inlet of the valve leads to the chamber via a clearance between the sliding portion of the guide and the seat (6), minimizing valve vibration with the damping effect of the chamber.
6.3 Function of relief valve

When the oil pressure in the circuit is lower than the setting pressure of the relief valve, the relief valve is not operated and the oil fed to the relief valve from the hydraulic pump flows into the implement control valve. As the oil pressure in the circuit increases, so does the pressure in the damping chamber D.C. When the pressure rises above the valve setting and overcomes the spring force, the valve opens. Oil then flows out to the transmission case through T port, preventing any further rise in pressure. The valve closes again when enough oil is released to drop pressure below the valve setting.

![Diagram of hydraulic system showing the parts and their connections.](image)

6.4 Specification of relief valve

The setting pressure of the relief valve is as follows.

<table>
<thead>
<tr>
<th>Relief valve setting pressure</th>
<th>Engine speed</th>
<th>Oil temperature</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.3 to 12.7 MPa</td>
<td>Maximum</td>
<td>40 to 50 °C</td>
</tr>
<tr>
<td>125 to 130 kgf/cm²</td>
<td></td>
<td>104 to 122 °F</td>
</tr>
<tr>
<td>1780 to 1840 psi</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
7. Hydraulic cylinder

7.1 Structure of hydraulic cylinder

While the lift arm (1) is rising, oil from the hydraulic pump flows into the hydraulic cylinder through the hydraulic control valve (12) and cylinder port C. Then oil pushes out the piston (5).

While the lift arm (1) is lowering, oil in the hydraulic cylinder is discharged to the transmission case through the hydraulic control valve by the weight of the implement. At this time, the lowering speed of the implement can be controlled by the ball (7) attached to the hydraulic cylinder (11). Turning the lowering speed adjusting knob clockwise decreases the lowering speed, and counterclockwise increases lowering speed. When the lowering speed adjusting valve is completely closed, the lift arm (1) is held at its position since oil in the hydraulic cylinder is sealed between the piston (5) and ball (7).
8. Hydraulic block type outlet

8.1 Structure of hydraulic block type outlet

- **NOTE**
  - This hydraulic block type outlet uses for front loader hydraulic system on standard specification.

The hydraulic block type outlet is located on the hydraulic cylinder assembly. This hydraulic block type outlet is provided to take power out from the tractor to operate the hydraulic cylinders on the implement, such as front end loader, front snow blade and so on.

![Diagram of hydraulic block type outlet]

- **MECHANISM**

KiSC issued 03, 2017 A
9. Mower linkage

9.1 Structure of mower linkage

The mower rear link (1) and the lift arm (5) are linked with the mower lift arm (2), the lift upper boss and the lift lower boss. As the hydraulic control lever moves to lift position, lift arm (5) is raised and the lift bracket (4) is pulled to pull the lift links to the rearward. As a result, mower rear link (1) is lifted.

The cutting height adjusting dial (3) adjusts cutting height of mower by rotating the adjusting cam (7). The position of mower rear link (1) is adjusted by changing the length of the adjusting bolt (6).
10. Front loader valve
10.1 Structure
10.1.1 Structure of front loader valve and pipe
10.1.2 Structure of front loader control valve

The control valve assembly consists of one casting block and four major sections.

**(1) Boom control section**

The boom control valve is of 4-position, 6-connection, detent, spring center type, consisting of a mono block valve housing, spool, load check valve, etc. This valve has A1 and B1 ports and controls oil flow to the boom cylinder.

**(2) Bucket control section**

The bucket control valve is of 3-position, 6-connection, no detent, spring center type, consisting of a mono block valve housing, spool, load check valve, etc. This valve has A2 and B2 ports and controls oil flow to the bucket cylinder.

**Inlet (P port) and outlet (T port) section**

This section has P and T ports.

The P port is connected to the outlet port of hydraulic block by the hydraulic pipe.

The T port is connected to the tank port of hydraulic block by the hydraulic pipe.

**Power beyond (PB port)**

This section has PB port which is connected to the inlet port of hydraulic block by the hydraulic hose, and feeds oil to the three point hydraulic control valve.
10.2 Front loader hydraulic circuit

- (1) Front loader control valve
- (2) Bucket control valve
- (3) Boom control valve

- a: To hydraulic block
10.3 Function of loader control valve

10.3.1 Loader control lever in neutral position

When the loader control lever is set at neutral position, the hydraulic oil enters from P port (P), flows through the boom spool valve (3) and the bucket spool valve (2), and exits at PB port (PB).

Neutral
10.3.2 Loader control lever in up position

1. When the loader control lever is set at up position, the boom spool valve (3) moves outward. This creates an oil passage between the boom spool valve (3) and the front loader control valve (1). The pressured oil from the pump port (P) enters to this oil passage. The pressured oil is delivered to the boom cylinder (7) through 1B port (1B). This extends and raises the boom cylinder.

2. When the boom spool valve (3) moves outward, a passage between the boom spool valve (3) and 1A port (1A) is created. The return oil from the boom cylinder enters 1A port (1A), flows through the bucket spool valve (2) and exits to PB port (PB).
7. HYDRAULIC SYSTEM

10.3.3 Loader control lever in down position

1. When the loader control lever is set at down position, the boom spool valve (3) moves inward. This creates an oil passage between the boom spool valve (3) and the front loader control valve (1). The pressured oil from the pump port (P) enters to the newly opened passage. The pressured oil is delivered to the boom cylinder (7) through 1A port (1A). This retracts and lowers the boom cylinder.

2. When the boom spool valve (3) moves inward, a passage between the boom spool valve (3) and 1B port (1B) is created. The return oil in the boom cylinder enters 1B port (1B), flows to the bucket spool valve (2), and exits to the PB port (PB).
7. HYDRAULIC SYSTEM

2B: 2B port
P: From hydraulic pump
PB: To 3-point hydraulic system
T: To tank, transmission case
a: Low pressure
b: High pressure
10.3.4 Loader control lever in floating position

1. When the loader control lever is set to floating position, the boom spool valve (3) moves further inward. This creates oil passages at 1A port (1A) and 1B port (1B), as well as a passage between the boom spool valve (3) and the front loader control valve (1).

2. The low pressured oil from the pump port (P) flows through the bucket spool valve (2), and exits to the PB port (PB).

3. The low pressured return oil in the boom cylinder enters 1A port (1A), flows through the boom spool valve (3), and goes to the tank port (T). The other low pressured return oil in the boom cylinder enters 1B port (1B), flows through the boom spool valve (3), and goes to the tank port (T). As a result, the boom is floating.
7. HYDRAULIC SYSTEM

(5) Detent plug (Boom control)  1A: 1A port  PB: To 3-point hydraulic system
10.3.5 Loader control lever in roll-back position

1. When the loader control lever is set at roll-back position, the bucket spool valve (2) moves outward. This creates oil passages at 2A port (2A) and 2B port (2B).
2. The pressured oil from the pump port (P) flows through 2B port (2B) to the bucket cylinder.
3. The low pressured return oil from the bucket cylinder enters 2A port (2A), flows through the front loader control valve (1), and goes to the tank port (T). As a result, the bucket moves to roll-back position.

**T:** To tank, transmission case

**a:** Low pressure

**b:** High pressure

**P:** From hydraulic pump

**PB:** To 3-point hydraulic system
10.3.6 Loader control lever in dump position

1. When the loader control lever is set to the dump position, the bucket spool valve (2) moves to the right. This creates an oil passage at 2A port (2A). The passage between 2B port (2B) and T port (T) is also opened.

2. The pressure-fed oil from P port (P) flows to the neutral passage through the boom control section. As the passage to the PB port (PB) is closed by the bucket spool valve (2), the arriving oil opens the load check valve (9) and flows to 2A port (2A) through the notched section of the bucket spool valve (2). This extends the bucket cylinder (8).

3. Return oil from the bucket cylinder (8) enters 2B port (2B) and travels throughout the valve to go to the transmission case through T port (T).

**RELATED PAGE**

TIGHTENING TORQUES on page 2-13
4. Checking and adjusting

4.1 Relief valve

4.1.1 Checking relief valve setting pressure

1. Disconnect the hydraulic hose (1) from the right side of the transaxle.
2. Install the hydraulic hose (6) and adaptor A (3) with pressure gauge (2).

3. Start the engine and set at maximum speed.

Condition

<table>
<thead>
<tr>
<th>Engine speed</th>
<th>Oil temperature</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum</td>
<td>45 to 55 °C</td>
</tr>
<tr>
<td></td>
<td>113 to 131 °F</td>
</tr>
</tbody>
</table>

4. Move the control lever all way up to operate the relief valve and read the gauge.
5. If the pressure is not within the factory specifications, adjust with the adjusting shim (5).

(Reference)

<table>
<thead>
<tr>
<th>Thickness of shim (5)</th>
<th>0.1 mm</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.004 in.</td>
</tr>
<tr>
<td></td>
<td>0.2 mm</td>
</tr>
<tr>
<td></td>
<td>0.008 in.</td>
</tr>
<tr>
<td></td>
<td>0.4 mm</td>
</tr>
<tr>
<td></td>
<td>0.02 in.</td>
</tr>
</tbody>
</table>

0.269 MPa (2.74 kgf/cm², 39.0 psi) pressure is increased whenever the thickness of adjusting shim is increased by 0.1 mm (0.004 in.).

4.2 Pump and priority valve

4.2.1 Checking hydraulic pump oil flow

IMPORTANT

- Use the instruction with the flowmeter when you use the flowmeter.
- While testing, do not close the flowmeter loading valve completely.
- To measure the flow volume of pump, oil flow on the power steering system side should be stopped.
1. Disconnect the power steering controller hose (inlet) (1) from the power steering pipe (2).

2. Cap the power steering pipe (2) with plug (3).
3. Remove the hydraulic pipe behind the hydraulic cylinder and fix the flow meter hose and the flow (meter) inlet as shown in the photo.
4. Remove the transmission fluid filling plug, then fix the flow meter hose and the flowmeter (outlet).
5. If the flow volume is insufficient, replace the pump.

(Reference)

**Pump oil flow**

<table>
<thead>
<tr>
<th>Hydraulic pump delivery at no pressure</th>
<th>Factory specification</th>
<th>Above</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>24.9 L/min.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>6.6 U.S.gals/min.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>5.5 Imp.gals/min.</td>
</tr>
</tbody>
</table>

6. After measuring the flow volume, remove the flow meter then reassembling the hydraulic pipe to the original position.

### 4.2.2 Checking power steering oil flow

**IMPORTANT**

- Use the instruction with the flowmeter when you use the flowmeter.
- While testing, do not close the flowmeter loading valve completely.
7. HYDRAULIC SYSTEM

4. Checking and adjusting

Condition

<table>
<thead>
<tr>
<th>Engine speed</th>
<th>Oil temperature</th>
</tr>
</thead>
<tbody>
<tr>
<td>1500 min⁻¹ (rpm)</td>
<td>45 to 55 °C 113 to 131 °F</td>
</tr>
</tbody>
</table>

1. Disconnect the power steering controller hose (inlet) (1) from the power steering pipe (2).
2. Fix the inlet flow meter hose to the power steering pipe (2) and the flow meter as shown in the photo.
3. Fix the flow meter return hose to the transmission fluid filling port and the flow meter as shown in the photo.
4. Measure the flow volume of power steering.
5. If the flow volume varies from the specification, replace the priority valve then take measurement again.

<table>
<thead>
<tr>
<th>Power steering oil flow</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Above 8.0 L/min. 2.1 U.S.gals/min. 1.8 Imp.gals/min.</td>
<td></td>
</tr>
</tbody>
</table>

6. After measuring the flow volume, remove the flow meter then reassemble the hydraulic pipe to the original position.

4.3 Mower lift linkage

4.3.1 Adjusting mower lift linkage

• After reassembling the mower lift linkage, be sure to adjust it as follows.

5. Disassembling and assembling

5.1 Hydraulic pump

5.1.1 Removing battery

⚠️ WARNING
To avoid serious injury or death:
• When disconnecting the battery cables, disconnect the negative cable from the battery first.
5.1.2 Removing lift rod and lower link

1. Remove the top link (2).
2. Remove the stopper pin (6) and remove the check chain plate (3).

5.1.3 Removing ROPS

1. Disconnect the R.H and L.H. hazard lamp/turn signals (3), (4) from the wire harness.
2. Remove the upper ROPS (1).

3. Remove the ROPS mounting bolts (6).
4. Remove the R.H. and L.H. lower ROPS (2), (5).

(When reassembling)

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>ROPS mounting bolt</th>
</tr>
</thead>
<tbody>
<tr>
<td>48.0 to 55.9 N⋅m</td>
<td>4.90 to 5.70 kgf⋅m</td>
</tr>
<tr>
<td>35.5 to 41.2 lbf⋅ft</td>
<td></td>
</tr>
</tbody>
</table>

5.1.4 Removing seat
1. Disconnect the seat switch connectors.
2. Remove the snap pins (2) to remove the seat (1).

5.1.5 Removing step
1. Disconnect the upper cruise control rod (1) from the lower cruise control rod.
2. Remove the R.H. and L.H. side covers (2), (7).

5.1.6 Removing fender
1. Disconnect the L.H. and R.H. tail lamps (3), (7) from the wire harness.
2. Disconnect the 12 V outlet (2) from the wire harness.

**NOTE**
- 12 V outlet connector is near the L.H. tail lamp connector.
3. Remove the L.H. lever grips (3).
4. Remove the differential lock pedal cover (4), cutting height adjusting dial knob (5), and lower speed adjusting knob (6).
5. Remove the R.H. lever grips (7).
6. Remove the R.H. lever guide (8) and R.H. handrail (10).
7. Remove the L.H. lever guide stay nut.

8. Remove the fender (9).

5.1.7 Removing fuel tank
1. Remove the and R.H. lever guide stay (1).
2. Drain the fuel from the fuel tank.
3. Disconnect the fuel sensor connectors (4) and safety switch connector (7).

4. Remove the fuel tube cover (2).
5. Disconnect the fuel return hose (6) and fuel supply hose (8).
6. Remove the seat stopper (3).
7. Remove the R.H. and L.H. fuel tank stays (9) and cushions (10), then remove the fuel tank (5).

5.1.8 Removing fender center stay
1. Remove the fender center stay (1).

5.1.9 Removing hydraulic pump
1. Disconnect the mower linkage (4).
2. Remove the lift arm L.H. (2).

3. Remove the hydraulic pipes (1).
4. Remove the hydraulic pump (3).

(When reassembling)
- Since the mounting bolt (5) is installed through the transaxle case to the transmission oil tank, seal the sealing tape to the mounting bolt (5) securely.
5.2.2 Removing lift rod and lower link

1. Remove the top link (2).
2. Remove the stopper pin (6) and remove the check chain plate (3).

3. Move the bushes (8) to inside.
4. Move the shaft (9) to right side and remove the lower link as a unit.

5.2.3 Removing ROPS

1. Disconnect the R.H and L.H. hazard lamp/turn signals (3), (4) from the wire harness.
2. Remove the upper ROPS (1).

5.2.4 Removing seat

1. Disconnect the seat switch connectors.
2. Remove the snap pins (2) to remove the seat (1).

5.2.5 Removing step

1. Disconnect the upper cruise control rod (1) from the lower cruise control rod.
2. Remove the R.H. and L.H. side covers (2), (7).

3. Remove the step mat (3).

4. Remove the forward and reverse HST pedals (5), (6).

5. Remove the step (4).

5.2.6 Removing fender

1. Disconnect the L.H. and R.H. tail lamps (3), (7) from the wire harness.
2. Disconnect the 12 V outlet (2) from the wire harness.

**NOTE**
- 12 V outlet connector is near the L.H. tail lamp connector.

3. Remove the L.H. lever grips (3).

4. Remove the differential lock pedal cover (4), cutting height adjusting dial knob (5), and lower speed adjusting knob (6).

5. Remove the R.H. lever grips (7).

6. Remove the R.H. lever guide (8) and R.H. handrail (10).

7. Remove the L.H. lever guide stay nut.

5.2.7 Removing fuel tank

1. Remove the and R.H. lever guide stay (1).
2. Drain the fuel from the fuel tank.
3. Disconnect the fuel sensor connectors (4) and safety switch connector (7).

4. Remove the fuel tube cover (2).

5. Disconnect the fuel return hose (6) and fuel supply hose (8).

6. Remove the seat stopper (3).
7. Remove the R.H. and L.H. fuel tank stays (9) and cushions (10), then remove the fuel tank (5).

5.2.8 Removing fender center stay
1. Remove the fender center stay (1).

5.2.9 Removing mower linkage and wire harness
1. Disconnect the mower linkage (2).

5.2.10 Removing hydraulic cylinder block
1. Remove the hydraulic hose (1).

2. Remove the wire harness clamp and wire harness (1) from the hydraulic cylinder block.

---

5.3 Hydraulic cylinder and control valve

5.3.1 Removing control valve

1. Remove the control valve (1).

2. Remove the internal snap ring (4) and draw out the spool (2).

5.3.2 Removing control valve lever

1. Pull out the pin (1).
2. Remove the control valve lever (3) and arm (2).

5.3.3 Removing lift arm, hydraulic arm shaft and hydraulic arm

1. Remove the external snap rings (8), (10) and remove the lift arms (2), (7).
2. Draw out the hydraulic arm shaft (4).

(When reassembling)

- Align the alignment marks of the hydraulic arm (5) and hydraulic arm shaft (4).
- Align the alignment marks of the lift arms (2), (7) and hydraulic arm shaft (4).
- Apply grease to the right and left bushings and O-rings.
- Be careful not to damage the O-ring.

### Tightening torque

<table>
<thead>
<tr>
<th>Hydraulic cylinder block mounting bolt</th>
<th>40 to 44 N·m</th>
<th>4.0 to 4.5 kgf·m</th>
<th>29 to 32 lbf·ft</th>
</tr>
</thead>
</table>
5.3.4 Removing hydraulic piston

1. Inject the compressed air into the hydraulic cylinder, and remove the hydraulic piston (1).

- Be careful not to damage the O-ring (3) and back-up ring (2).
- Apply transmission fluid to the O-ring.
- Replace the O-ring if it is damaged, worn or scratched, which may cause oil leakage.

(When reassembling)
- Be careful not to damage the O-rings.

5.3.5 Removing lowering speed adjusting valve

1. Remove the internal snap ring (5) and remove the lowering speed adjusting shaft (6).
2. Remove the ball (2) and spring (1).

(When reassembling)
- Be careful not to damage the O-rings.
5.4 Mower lift linkage

5.4.1 Disassembling mower linkage

1. Remove the clevis pin and remove the lift link rear L.H. (7).
2. Remove the pin and remove the mower rear links (1), (8).
3. Remove both side of boss and remove the lift link rear R.H. (2).
4. Remove the cutting height adjusting dial knob (3).
5. Remove the nut and remove the adjusting cam (9) and cutting height adjusting rod (4).

(When reassembling)
- Adjust the length of the link adjusting bolt.
5.5 Control valve (Front loader)

5.5.1 Removing battery

⚠️ WARNING
To avoid serious injury or death:
• When disconnecting the battery cables, disconnect the negative cable from the battery first.
• When connecting, connect the positive cable to the battery first.

1. Remove the under panel (1).

2. Disconnect the negative cable (3) from the battery (2).

3. Disconnect the positive cable (4) from the battery (2) and remove the battery.

5.5.2 Removing ROPS

1. Disconnect the R.H and L.H. hazard lamp/turn signals (3), (4) from the wire harness.
2. Remove the upper ROPS (1).

3. Remove the ROPS mounting bolts (6).
4. Remove the R.H. and L.H. lower ROPS (2), (5).

(When reassembling)

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>ROPS mounting bolt</th>
</tr>
</thead>
<tbody>
<tr>
<td>≈ 48.0 to 55.9 N m</td>
<td>4.90 to 5.70 kgf m</td>
</tr>
<tr>
<td>≈ 35.5 to 41.2 lbf ft</td>
<td></td>
</tr>
</tbody>
</table>

5.5.3 Removing seat

1. Disconnect the seat switch connectors.
2. Remove the snap pins (2) to remove the seat (1).

5.5.4 Removing step

1. Disconnect the upper cruise control rod (1) from the lower cruise control rod.
2. Remove the R.H. and L.H. side covers (2), (7).

3. Remove the step mat (3).

4. Remove the forward and reverse HST pedals (5), (6).

5. Remove the step (4).

5.5.5 Removing fender
1. Disconnect the L.H. and R.H. tail lamps (3), (7) from the wire harness.
2. Disconnect the 12 V outlet (2) from the wire harness.

   **NOTE**
   - 12 V outlet connector is near the L.H. tail lamp connector.

3. Remove the L.H. lever grips (3).

4. Remove the differential lock pedal cover (4), cutting height adjusting dial knob (5), and lower speed adjusting knob (6).
5. Remove the R.H. lever grips (7).
6. Remove the R.H. lever guide (8) and R.H. handrail (10).
7. Remove the L.H. lever guide stay nut.

8. Remove the fender (9).

5.5.6 Removing control valve
1. Disconnect the hydraulic hoses (2).
2. Disconnect hydraulic pipes (4).
3. Disconnect the rods (3).
4. Remove the control valve (1) from the valve stay (5).

   **(When reassembling)**

   **IMPORTANT**
   - After reassembling a valve, check for oil leakage by starting up engine.
5.5.7 Disassembling control valve

1. Remove the load check valve assemblies (27).
2. Remove the detent plug assembly (13) and plug (14).
3. Remove the bucket spool (1) with parts (15) to (22) from the valve body (28).
4. Remove the boom spool (2) with parts (3) to (12) from the valve body.

(When reassembling)
- Clean all parts with a suitable solvent, and dry with a lint-free cloth or air.
- Visually inspect all parts for damage.
- When installing the spools into the valve body, be careful not to damage the O-rings.
6. Servicing

6.1 Hydraulic pump

6.1.1 Checking clearance between tip of gear tooth and casing

1. Measure the gear O.D. with an outside micrometer.

<table>
<thead>
<tr>
<th>Gear O.D.</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>33.520 to 33.530 mm</td>
<td>1.3197 to 1.3200 in.</td>
</tr>
</tbody>
</table>

2. Measure the casing I.D. with a cylinder gauge and calculate the clearance.

<table>
<thead>
<tr>
<th>Case I.D.</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>33.570 to 33.577 mm</td>
<td>1.3217 to 1.3219 in.</td>
</tr>
</tbody>
</table>

3. If the clearance exceeds the allowable limit, replace the assembly.

<table>
<thead>
<tr>
<th>Clearance between tip of gear tooth and casing</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.15 mm</td>
<td>0.0059 in.</td>
</tr>
</tbody>
</table>

6.1.2 Checking clearance between bushing and shaft

1. Measure the gear shaft O.D. with an outside micrometer.

<table>
<thead>
<tr>
<th>Shaft O.D.</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>14.970 to 14.980 mm</td>
<td>0.58937 to 0.58976 in.</td>
</tr>
</tbody>
</table>

2. Measure the bushing I.D. with a cylinder gauge and calculate the clearance.

<table>
<thead>
<tr>
<th>Bushing I.D.</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.000 to 15.061 mm</td>
<td>0.59056 to 0.59295 in.</td>
</tr>
</tbody>
</table>

3. If the clearance exceeds the allowable limit, replace it.

<table>
<thead>
<tr>
<th>Clearance between bushing and shaft</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.020 to 0.091 mm</td>
<td>0.00079 to 0.0035 in.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.12 mm</td>
</tr>
<tr>
<td>0.0047 in.</td>
</tr>
</tbody>
</table>
6.1.3 Checking side plate thickness
1. Measure the side plate thickness with an outside micrometer.

2. If the thickness is less than the allowable limit, replace it.

<table>
<thead>
<tr>
<th>Side plate thickness</th>
<th>Factory specification</th>
<th>Allowable limit</th>
</tr>
</thead>

</tr>
</tbody>
</table>

6.2 Hydraulic cylinder
6.2.1 Checking hydraulic cylinder bore
1. Check the cylinder internal surface for scoring or damage.
2. Measure the cylinder I.D. with a cylinder gauge.
3. If the measurement exceeds the allowable limit, replace the hydraulic cylinder block.

6.2.2 Checking hydraulic arm shaft bushing
1. Visually inspect the DX bushings for signs of wear or damage. The DX bushing tends to show concentrated wear.
2. If the DX bushing is worn beyond the alloy thickness (A), replace it.

9Y1211344ELM016enUS

KiSC issued 03, 2017 A
3.3 Precautions on handling electrical connectors

1. When disconnecting connectors, grasp the body of the connector and pull it out; do not pull on the wiring harness. If the connector is the locking type, release the lock and then pull to disconnect.
2. When removing a connector's plastic cover (for water protection) to inspect it, be careful not to let any water get in the connector. If water does get in, dry it thoroughly before reassembling the connector and putting its plastic cover securely in place.
3. Straighten any bent connector terminals and make sure none are sticking out or missing. Also make sure there is no corrosion on the connector's terminals before connecting it.
4. When connecting a locking connector, be sure to press it in until you hear it click and then pull gently on the harness close to the connector and make sure the harness does not come out.
4. Starting system

4.1 Electrical circuit of starting system

When the main switch is turned to the **GLOW** position, the terminal BAT is connected to the terminal ON and AC. The glow plugs become red-hot, and the preheat indicator lamp also lights on while preheating. When the main switch is then turned to the **START** position with the safety switches on, the terminal BAT is connected to the terminals GLOW and ST. Consequently, battery current flows to the starter motor and start the engine. The main switch automatically returns to the **ON** position, the terminal BAT is connected only to the terminal GLOW, thereby causing the starting circuit to be opened, stopping the starter motor. When the main switch turned from the **ON** position to the **OFF** position, the fuel cut-off solenoid moves the fuel injection pump control rack to the **no fuel injection** position and stops the engine. The OPC timer equipped is the operator presence control (OPC) system which automatically stops the engine in approximately one second when operator stands from the seat while shifting the PTO clutch lever and range gear shift lever.

![Electrical circuit diagram](image)
4.2 Function of relay

A relay (1) is an electrically operated switch. Relays are used where it is necessary to control a circuit by a low-power signal (with complete electrical isolation between control and controlled circuits), or where several circuits must be controlled by one signal.

Current flowing from switch to relay winding (5) cause ON (Close) or OFF (Open) of mechanical contact points (9).

When current is applied to the winding (energized) (10), a magnetic field pushes the contact lever (8) and normally open terminal is connected.

4.3 Function of starter

The reduction system is used planetary gears, and the speed of gear shaft (6) is reduced to approximately one-fifth of the armature shaft (9).

The pinion gear (4) is pushed against the ring gear with the overrunning clutch (5) by the drive lever (2).
4.4 Function of glow plug

This plug is a two-material type QGS (Quick Glow System) for quick temperature rise, and has self-controlling function as well as excellent durability. The heater (4) connected in series to the heater (3), which also functions as the resistor, is incorporated in the sheath tube (1) of the super glow plug. The resistance of this heater (3) cum resistor is small when the temperature is low, while the resistance becomes large when the temperature rises. Therefore, because sufficient current is flown to the heater (4) during the initial period of energization, the temperature rises quickly and the resistance grows with the rise in the temperature of the resistor, the flowing current is reduces to prevent the heater (4) from being heated.

The ignition point is in the area of 2 to 3 mm (0.079 to 0.118 in.) from the tip of the plug in order to reduce its projection into the combustion chamber.

4.5 Function of safety switch

The safety switch is electrically closed in normal condition (normally closed type). The switch operates as sensor detecting and transmitting the position of HST pedal, PTO lever, independent PTO lever, and seat to engine stop solenoid.

<table>
<thead>
<tr>
<th>Type of switch</th>
<th>Safety switch name</th>
<th>Number of switch contact</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal open type</td>
<td>Seat switch</td>
<td>1</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>Independent PTO lever switch (Rear PTO switch)</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td>HST pedal neutral switch</td>
<td>2</td>
</tr>
</tbody>
</table>

4.6 Function of fuel pump

An electromagnetic fuel pump uses a transistor that causes the pump to start pumping fuel when the main switch is turned to the ON position. Therefore, fuel is supplied to the fuel injection pump regardless of engine speed. This pump is driven by the battery. It can therefore be operated even with the engine being stopped.
5. OPC (Operator Presence Control) system

5.1 Electrical circuit of OPC timer

General electrical circuit of the tractor OPC timer is shown in the figure.

1. When sitting on the operator's seat with the main switch is in the ON position, the battery voltage passes to the seat switch and OPC timer (4), and keep the solenoid relay (8).

2. When standing up from the operator's seat, the circuit from the seat switch to the OPC timer is cut. However, if the PTO lever (or the speed control pedal) are set at NEUTRAL position, the circuit from the battery to the solenoid relay (8) is formed with the PTO switch (or HST switch).

3. When standing up from the operator's seat while shifting the levers, the circuit from the battery to the solenoid relay (8) is cut, and the engine is stopped by function of the solenoid (9).

Seat switch

The seat switch has two positions. When the operator's seat is occupied, the switch contact point is at ON position. When the operator's seat is not occupied, its contact point is at OFF position.

OPC timer

OPC timer is located electrically at between the seat switch (5) and the solenoid relay (8). When the current supply from the seat switch (5) is cut, the OPC timer (4) adopted for the OPC system has kept the state of ON position for approximately one second.
6. Charging system

6.1 Electrical circuit for charging system
6.2 Function of IC regulator (3P connector type)

3P connector is connected to the IC regulator. 3P connector consists of three leads, L (blue) lead (1), RY (red / yellow) lead (2), and WR (white / red) lead (3). L (blue) lead (1) is a lead to transmit the pulse from the alternator to hour meter and tachometer. When the main switch is in the **ON** position, the hour meter indicates operated hours. While the engine operates, the tachometer indicates the present engine revolutions. RY (red / yellow) lead (2) is a lead to chassis. WG (white / green) lead (3) is a lead to the charge lamp.

![Diagram of IC regulator connections](image)
7. Lighting system
7.1 Electrical circuit for lighting system
8. Gauges

8.1 Electrical circuit of gauge system
8. ELECTRICAL SYSTEM

8.2 Meter panel

8.2.1 Function of hour meter
The meter panel on this machine is equipped with a digital hour meter. The hour meter indicates in five digits the operated hours when the main switch is turned to the ON position.

<table>
<thead>
<tr>
<th>Tractor operated hours</th>
<th>The step that the display operates</th>
</tr>
</thead>
<tbody>
<tr>
<td>From 0.0 to 9999.9 Hr.</td>
<td>Every 0.1 Hr. step</td>
</tr>
<tr>
<td>10000 to 99999 Hr.</td>
<td>Every 1 Hr. step</td>
</tr>
<tr>
<td>After 99999 Hr.</td>
<td>99999 Hr. stays on</td>
</tr>
</tbody>
</table>

8.2.2 Function of tachometer
The meter panel on this machine is equipped with a tachometer.
When the key switch is in the ON position and the engine operates, the tachometer indicates the engine revolution per minute.
The meter picks up the voltage from the IC regulator located in the alternator.
The IC regulator sends a signal of the engine revolution to the meter.
The meter calculates the signal. It changes and indicates the signal to the engine revolution in cooperation with the voltage.

8.2.3 Function of fuel gauge
The meter panel on this machine is equipped with a fuel gauge.
The fuel level gauge and fuel level sensor are connected by the wire harness.
The fuel gauge detects the resistance from the fuel level sensor and indicates the fuel level in the fuel tank.
- When the fuel is close to empty level, the low fuel indicator lamp comes on.

8.2.4 Function of coolant temperature gauge
The meter panel on this machine is equipped with a coolant temperature gauge.
The coolant temperature gauge and coolant temperature sensor are connected by the wiring harness.
The coolant temperature gauge detects the resistance from the coolant temperature sensor.
The coolant temperature gauge indicates the coolant temperature in the thermostat housing.

The relationship between the resistance of coolant temperature sensor and reading on the coolant temperature gauge is as follows.

- When the coolant temperature stays at 123 °C (253 °F), the coolant temperature indicator lamp comes on.
- When the coolant temperature stays below 118 °C (244 °F), the coolant temperature indicator lamp turns off.

Current varies with changes in the coolant temperature. When the coolant temperature is increased, the electrical resistance will become small, and when the coolant temperature is decreased, it will become large.

8.3 Function of fuel level sensor

The remaining fuel quantity is detected by the fuel level sensor installed in the fuel tank and indicated on the fuel gauge. For detection, a float and a resistor are used.

As the float lowers, the resistance of the variable resistor varies.

8.4 Function of coolant temperature sensor

The coolant temperature sensor is installed to the water pump housing, and its tip is in touch with the coolant. It contains a thermistor (4) whose electrical resistance decreases as the temperature increases.
8.5 Function of oil pressure switch

[A] At the proper oil pressure
When the engine is started and as the proper oil pressure builds, the diaphragm (4) is pushed up. This separates the contact rivet (5) and breaks the circuit, causing the lamp to go out.

[B] At lower oil pressure, 49 kPa (0.50 kgf/cm², 7.1 psi) or less
If the oil pressure drops, the resulting deflection of the diaphragm (4) will close the contact rivet (5) and again complete the circuit. The lighted lamp warns that the pressure of the lubricating system has dropped below the pressure setting.

The oil pressure switch is mounted on the cylinder block and is led to the lubricating oil passage. When the oil pressure falls below the specified value, the oil pressure-warning lamp lights.
9. Others

9.1 Electrical circuit for accessory
9.2 Function of DC outlet

**IMPORTANT**
- Do not use as cigarette lighter.
- Do not use when wet.

This machine is equipped with a DC outlet. It is located inside of the L.H. lever guide compartment. The capacity of the outlet is 12 V / 120 W. Electrical device's such as an auxiliary light, mobile phone battery charger, or other 12 V components can be used with the outlet.

--- RELATED PAGE ---
TIGHTENING TORQUES on page 2-13
4. Checking and adjusting

4.1 Battery

4.1.1 Checking battery voltage

1. Stop the engine and turn the main switch OFF.
2. Connect the COM (−) lead of the voltmeter to the battery's negative terminal post and the (+) lead to the positive terminal post, and measure the battery voltage.
3. If the battery voltage is less than the factory specification, check the battery specific gravity and recharge the battery.

<table>
<thead>
<tr>
<th>Battery voltage</th>
<th>Factory specification</th>
<th>More than 12 V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Factory specifi-</td>
<td>Factory specifi-</td>
<td>Less than 0.1 V</td>
</tr>
<tr>
<td>cation</td>
<td>cation</td>
<td></td>
</tr>
</tbody>
</table>

4.1.2 Checking battery terminal connection

1. Turn the main switch ON, and turn on the headlight.
2. Measure the voltage with a voltmeter across the battery's positive terminal post and the cable terminal, and the voltage across the battery's negative terminal post and the chassis.
3. If the measurement exceeds the factory specification, clean the battery terminal posts and cable clamps, and tighten them firmly.

<table>
<thead>
<tr>
<th>Potential difference</th>
<th>Factory specification</th>
<th>Less than 0.1 V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Factory specifi-</td>
<td>Factory specifi-</td>
<td>Less than 0.1 V</td>

<tr>
<td>cation</td>
<td>cation</td>
<td></td>
</tr>
</tbody>
</table>

4.1.3 Checking battery specific gravity

**NOTE**
- Hold the hydrometer tube vertical without removing it from the electrolyte.
- Do not suck too much electrolyte into the tube.
- Allow the float to move freely and hold the hydrometer at eye level.
- The hydrometer reading must be taken at the highest electrolyte level.

(a) Good  
(b) Bad  
(c) Bad

1. Check the specific gravity of the electrolyte in each cell with a hydrometer.
2. When the electrolyte temperature differs from that at which the hydrometer was calibrated, correct the specific gravity reading following the formula mentioned in (Reference).

(Reference)
- Specific gravity slightly varies with temperature. To be exact, the specific gravity decreases by 0.0007 with an increase of 1 °C (0.0004 with an increase of 1 °F) in temperature, and increases by 0.0007 with a decrease of 1 °C (0.0004 with a decrease of 1 °F).

Therefore, using 20 °C (68 °F) as a reference, the specific gravity reading must be corrected by the following formula:
  - Specific gravity at 20 °C = Measured value + 0.0007 × (electrolyte temperature -20 °C)
  - Specific gravity at 68 °F = Measured value + 0.0004 × (electrolyte temperature -68 °F)

At an electrolyte temperature of 20 °C (68 °F)

3. If the specific gravity is less than 1.215 (after it is corrected for temperature), charge or replace the battery.

4. If the specific gravity differs between any two cells by more than 0.05, replace the battery.

### 4.2 Main switch

#### 4.2.1 Checking main switch connector voltage

1. Remove the under cover panel.
2. Disconnect the 4P connector and remove the main switch (1).

3. Measure the voltage with a voltmeter across the 4P connector 3 terminal and the chassis.

4. If the voltage differs from the battery voltage (11 to 14 V), the wiring harness is damaged.

### 4.2.2 Checking main switch continuity at off position

1. Set the main switch to the OFF position.
2. Measure the resistance with an ohmmeter across the B terminal and the ACC terminal, B terminal and ST terminal, B terminal and G terminal.
3. If infinity is not indicated, the contacts of the main switch are damaged.
4.2.3 Checking main switch continuity at on position

1. Set the main switch to the ON position.
2. Measure the resistance with an ohmmeter across the B terminal and the ACC terminal.
3. If 0 ohm is not indicated, the B – ACC contact of the main switch is damaged.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>B terminal – ACC terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0 Ω</td>
</tr>
</tbody>
</table>

4.2.4 Checking main switch continuity at preheat position

1. Set and hold the main switch key at the PREHEAT position.
2. Measure the resistance with an ohmmeter across the B terminal and the G terminal, across the B terminal and the ST terminal, and across the B terminal and the ACC terminal.
3. If 0 ohm is not indicated, these contacts of the main switch are damaged.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>B terminal – G terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0 Ω</td>
</tr>
</tbody>
</table>

4.2.5 Checking main switch continuity at start position

1. Set and hold the main switch key at the START position.
2. Measure the resistance with an ohmmeter across the B terminal and the G terminal, and across the B terminal and the ACC terminal.
3. If 0 ohm is not indicated, these contacts of the main switch are damaged.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>B terminal – G terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0 Ω</td>
</tr>
</tbody>
</table>

4.3 Starter

4.3.1 Checking motor

- Secure the starter to prevent it from jumping up and down while testing the motor.
1. Disconnect the battery negative cable from the battery.
2. Disconnect the battery positive cable and the leads from the starter.
3. Remove the starter from the engine.
4. Disconnect the connecting lead (2) from the starter C terminal (1).
5. Connect a jumper lead from the connecting lead (2) to the battery positive terminal post.
6. Connect a jumper lead momentarily between the starter motor housing and the battery negative terminal post.
7. If the motor does not operate, check the motor.

4.3.2 Testing starter magnet switch (pull-in, holding coils)

**IMPORTANT**
- Testing time must be 3 to 5 sec.

1. Remove the motor from the starter housing.
2. Prepare a 6 V battery for the test.
3. Connect jumper leads from the battery negative terminal to the housing and the starter C terminal.

The plunger should be attracted and the pinion gear should pop out when a jumper lead is connected from the battery positive terminal to the S terminal.

4. Disconnect the jumper lead to the starter C terminal. Then the pinion gear should remain popped out.

### 4.4 Glow plug

**4.4.1 Checking glow plug lead terminal voltage**

1. Disconnect the wiring lead (2) from the glow plug (1) after turning the main switch OFF.

2. Turn the main switch key to the **PREHEAT** position, and measure the voltage between the lead terminal and the chassis.
3. Turn the main switch key to the **START** position, and measure the voltage with a voltmeter between the lead terminal and the chassis.
4. If the voltage at either position differs from the battery voltage, the wiring harness or main switch is damaged.

<table>
<thead>
<tr>
<th>Voltage (Lead terminal – Chassis)</th>

<tbody>
<tr>
<td>Main switch key at START</td>
<td>Approx. battery voltage</td>
<td></td>
</tr>
</tbody>
</table>

(A) Glow plug (B) Wiring lead (Positive)
4.4.2 Checking glow plug continuity

1. Disconnect the lead from the glow plugs.
2. Measure the resistance with an ohmmeter between the glow plug terminal and the chassis.
3. If 0 ohm is indicated, the screw at the tip of the glow plug and the housing are short-circuited.
4. If the factory specification is not indicated, the glow plug is damaged.

<table>
<thead>
<tr>
<th>Glow plug</th>
<th>Factory specification</th>
<th>Approx. 0.9 Ω</th>

4.5 Safety switch

4.5.1 Checking PTO shift lever switch continuity

1. Remove the left rear wheel.
2. Remove the PTO shift lever switch (1).
3. Measure the resistance with an ohmmeter across the switch terminals.
4. If the resistance values specified below are not indicated, the safety switch is damaged.

Plunger is pushed into the switch body.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>4 terminal (3) – 8 terminal (4)</th>
<th>0 Ω</th>

</tr>
</tbody>
</table>
4.5.2 Checking HST neutral switch continuity

1. Remove the right rear wheel.
2. Remove the HST neutral switch (1).
3. Measure the resistance with an ohmmeter across the HST neutral switch terminals.
4. If the resistance values specified below are not indicated, the safety switch is damaged.

<table>
<thead>
<tr>
<th>Terminal Configuration</th>

4.6 Operator presence control (OPC) system

4.6.1 Checking seat switch and seat turnover switch continuity

1. Disconnect the 2P connectors (2), (3) from the seat switch and the seat turnover switch (1).
2. Remove the seat switch and seat turnover switch (1).
3. Connect the circuit tester to the terminals (5).

<table>
<thead>
<tr>
<th>Terminal Configuration</th>
<th>Resistance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Seat switch / seat turnover switch</td>
<td>0 Ω</td>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Infinity</td>
</tr>
</tbody>
</table>

(When switch is pushed / when operator sits on the seat)
1. Measure the resistance between terminals (5).
2. If continuity is not as shown below, the switch is damaged. Replace it.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>When switch is pushed / when operator sits on the seat.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0 Ω</td>
</tr>
</tbody>
</table>

4.6.2 Checking OPC timer

![Diagram of OPC timer connections]

- Orange / white terminal (from battery)
- Yellow terminal (from OPC switch)
- Red terminal (to key stop solenoid)
- Black terminal (to frame earth)
- Bulb (Load)
- Battery
1. Remove the OPC timer. The OPC timer is located under the upper panel.

2. Connect the jumper leads across the battery terminal and the red / white terminal (2), and across the battery positive terminal and the yellow terminal (3).

3. Connect the jumper lead across the battery negative terminal and the black terminal (5), and across the battery negative terminal and the bulb terminal.

4. Connect the jumper lead across the red terminal (4) and the bulb terminal.

5. If the bulb lights up when disconnecting the jumper lead from the red / white terminal (2), the OPC timer (1) is proper.

### 4.7 Fuel pump

#### 4.7.1 Checking fuel pump connector voltage

1. Disconnect the 2P connector from the fuel pump.

2. Turn the main switch key to the ON position, and measure the voltage with a voltmeter between the connector terminals.

3. If the voltage differs from the battery voltage, the wiring harness or main switch is damaged.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Between connector terminals</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
</table>

#### 4.7.2 Checking fuel pump continuity

1. Disconnect the 2P connector from the fuel pump.

2. Check the continuity between the connector terminals with an ohmmeter.

3. If it does not conduct, the fuel pump is damaged.

### 4.8 Engine stop solenoid

#### 4.8.1 Testing engine stop solenoid

1. Disconnect the 1P connector from the engine stop solenoid.

2. Remove the engine stop solenoid from the engine.

3. Connect the jumper leads from the battery positive terminal to the 1P connector, and from the battery negative terminal to the engine stop solenoid body.
4. If the solenoid plunger is not attracted, the engine stop solenoid is damaged.

4.9 Timer relay

4.9.1 Checking timer relay connector voltage

1. Disconnect the connector from the timer relay after turning the main switch OFF.
2. Measure the voltage with a voltmeter across the connector terminal 4 and chassis.
3. Turn the main switch ON, and measure the voltage across the connector terminal 3 and chassis.
4. If these voltages differ from the battery voltage, the wiring harness or main switch is damaged.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connector terminal 4 – Chassis</td>
<td></td>
</tr>
<tr>
<td>Connector terminal 3 – Chassis</td>
<td></td>
</tr>
</tbody>
</table>

4.9.2 Testing timer relay

1. Remove the timer relay (1).

2. Connect jumper leads across the battery positive terminal and the timer relay terminal 3, and across the battery positive terminal and the timer relay terminal 4.
3. Connect jumper leads across the battery negative terminal and the timer relay terminal 2, and across the battery negative terminal and the bulb terminal.
4. Connect jumper lead across the timer relay terminal 1 and the bulb terminal.
5. If the bulb lights up when disconnecting a jumper lead from the terminal 3 and goes off 6 to 13 seconds late, the timer relay is proper.

4.10 Charging system

4.10.1 Checking battery charging current

NOTE
- Connect an ammeter only after starting the engine.
- When the electrical loads is considerably low or the battery is fully charged, the specified reading may not be obtained.

<table>
<thead>
<tr>
<th>Current</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>14 to 15 A</td>
<td></td>
</tr>
<tr>
<td>Voltage</td>
<td>14 to 15 V</td>
</tr>
<tr>
<td>Alternator speed</td>
<td>5200 min⁻¹ (rpm)</td>
</tr>
</tbody>
</table>
1. After starting the engine, disconnect the battery positive cord (+), and connect an ammeter and voltmeter. Then switch on all electrical loads (such as head lights) and measure the charging current.

![Battery positive cord diagram]

(1) Battery positive cord

### 4.11 Combination switch

#### 4.11.1 Removing combination switch

1. Remove the under panel, and disconnect the combination switch connector.
2. Remove the combination switch (1).

#### 4.11.2 Checking combination switch connector voltage

1. Measure the voltage with a voltmeter across the connector 2 terminal and chassis when the main switch is in the ON position.

#### 4.11.3 Checking head light switch continuity when setting switch at OFF position

1. Set the light switch to the OFF position.

<table>
<thead>
<tr>
<th>(1) Red / yellow lead</th>
<th>(4) Orange lead</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2) Blue / white lead</td>
<td>(5) Red / white lead</td>
</tr>
<tr>
<td>(3) Yellow lead</td>
<td>(A) Head light OFF position</td>
</tr>
</tbody>
</table>
2. Measure the resistance with an ohmmeter across the red / yellow lead (1) to the orange lead (4), the red / yellow lead (1) to the yellow lead (3).

3. If infinity is not indicated, the head light switch is damaged.

<table>
<thead>
<tr>
<th>Resistance (Switch at OFF position)</th>
<th>Red / yellow lead (1) – Orange lead (4)</th>
<th>Infinity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red / yellow lead (1) – Yellow lead (3)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

4.11.4 Checking head light switch continuity when setting switch at ON position

1. Set the light switch to the ON position.
2. Measure the resistance with an ohmmeter across the red / yellow lead (1) to the orange lead (4) and the red / yellow lead (1) to the yellow lead (3).
3. If infinity is not indicated, the head light switch is damaged.

<table>
<thead>
<tr>
<th>Resistance (Switch at ON position)</th>
<th>Red / yellow lead (1) – Orange lead (4)</th>
<th>0 Ω</th>

</thead>
<tbody>
<tr>
<td>Red / yellow lead (1) – Yellow lead (3)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

4.11.5 Checking turn signal light switch continuity when setting switch knob at OFF position

1. Set the turn signal switch knob to the OFF position.
2. Measure the resistance with an ohmmeter across the green lead (1) and red / white lead (2), and across to the green lead (1) and green / white lead (3).
3. If infinity is not indicated, the combination switch is damaged.

<table>
<thead>
<tr>
<th>Resistance (Switch knob at OFF position)</th>
<th>Green lead (1) – Red / white lead (2)</th>

</tr>
</thead>
<tbody>
<tr>
<td>Green lead (1) – Green / white lead (3)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
4.11.6 Checking turn signal light switch continuity when setting switch knob at RIGHT position

1. Set the turn signal switch knob to the RIGHT position.
2. Measure the resistance with an ohmmeter across the green lead (1) and red / white lead (2), and across to the green lead (1) and green / white lead (3).
3. If 0 Ω is not indicated, the combination switch is damaged.

<table>
<thead>
<tr>
<th>Resistance (Switch knob at RIGHT position)</th>
<th>Green lead (1) – Red / white lead (2)</th>
<th>0 Ω</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Green lead (1) – Green / white lead (3)</td>
<td>Infinity</td>
</tr>
</tbody>
</table>

4.11.7 Checking turn signal light switch continuity when setting switch knob at LEFT position

1. Set the turn signal switch knob to the LEFT position.
2. Measure the resistance with an ohmmeter across the green lead (1) and red / white lead (2), and across to the green lead (1) and green / white lead (3).
3. If 0 Ω is not indicated, the combination switch is damaged.

<table>
<thead>
<tr>
<th>Resistance (Switch knob at LEFT position)</th>
<th>Green lead (1) – Red / white lead (2)</th>
<th>Infinity</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Green lead (1) – Green / white lead (3)</td>
<td>0 Ω</td>
</tr>
</tbody>
</table>
4.11.8 Checking hazard switch continuity when setting switch knob at OFF position

1. Set the hazard switch knob to the OFF position.
2. Measure the resistance with an ohmmeter across the black / blue lead (1) and blue / white lead (2).
3. If infinity is not indicated, the combination switch is damaged.

| Resistance (Hazard switch at OFF position) | Black / blue lead (1) – Blue / white lead (2) | Infinity |

4.11.9 Checking hazard switch continuity when setting switch knob at ON position

1. Set the hazard switch knob to the ON position.
2. Measure the resistance with an ohmmeter across the black / blue lead (1) and blue / white lead (2).
3. If 0 Ω is not indicated, the combination switch is damaged.

| Resistance (Hazard switch at ON position) | Black / blue lead (1) – Blue / white lead (2) | 0 Ω |

4.11.10 Checking flasher unit connector voltage

1. Remove the under panel.
2. Disconnect the connector from the flasher unit (1).

3. Measure the voltage with a voltmeter across the connector terminal h and chassis.

4. If the voltage differs from the battery voltage, the wiring harness is damaged.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Terminal h – chassis</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
</table>

4.11.11 Testing flasher unit actuation

1. Set the hazard switch to the ON position, and make sure the hazard lamp gives 60 to 85 flashes for a minute.

2. With the main switch and the hazard switch at the ACC and ON positions, respectively, move the turn signal light switch to the left. Make sure that the right-hand light stays on and the left-hand light gives flashes earlier (by about 20 flashes) than when the hazard lamp is activated. Then move the turn signal light switch to the right and make sure the corresponding actions take place.

3. Now set the main switch to the ACC position and move the turn signal switch alone. Make sure the same actions as above result.

4. If both the hazard switch and the turn signal light switch function but the above actions do not take place, replace the flasher unit with new one.
4.12 Gauge

4.12.1 Checking charge lamp (charging circuit)

1. Disconnect the 3P connector from the alternator after turning the main switch OFF.

2. Turn the main switch ON and connect a jumper lead from the wiring harness connector terminal (white / green) to the chassis.

**NOTE**

- If you connect the jumper lead from the wiring harness connector terminal (white / green) to the chassis, 15 A fuse will be blown. Do not connect the lead to red / yellow terminal.

3. If the charge lamp does not light, the wiring harness or fuse is damaged.

4.12.2 Checking engine oil pressure lamp

1. Disconnect the lead (2) from the engine oil pressure switch (1) after turning the main switch OFF.

2. Turn the main switch ON and connect a jumper lead from the lead to the chassis.

3. If the engine oil pressure indicator lamp does not light, the wiring harness is damaged.
4.12.3 Checking engine oil pressure switch continuity

1. Disconnect the lead (2) from the engine oil pressure switch (1).
2. Measure the resistance with an ohmmeter across the switch terminal and the chassis.
3. If 0 ohm is not indicated in the normal state, the switch is damaged.

| Resistance (Switch terminal – Chassis) | In normal state | 0 Ω |

4. If infinity is not indicated at pressure, the switch is damaged.

| Resistance (Switch terminal – Chassis) | At pressure over approx. 49 kPa 0.50 kgf/cm² 7.1 psi | Infinity |

4.12.4 Checking fuel level sensor continuity

1. Remove the fuel level sensor from the fuel tank.
2. Measure the resistance with an ohmmeter across the sensor terminal and its body.
3. If the reference values are not indicated, the sensor is damaged.

| Resistance (Sensor terminal – Sensor body) | Reference value | Float at upper-most position (Full) | 2.75 to 3.15 Ω |
|                                          |                | Float at lower-most position (Empty) | 97 to 113 Ω |

4.12.5 Checking coolant temperature sensor connector voltage

1. Disconnect the 2P connector from the coolant temperature sensor after turning the main switch OFF.
2. Turn the main switch ON and measure the voltage with a voltmeter across the 2 terminal (W/Y) and the chassis.
3. If the voltage differs from the reference voltage, the wiring harness, fuse or coolant temperature gauge is damaged.

| Voltage | 2 terminal (W/Y) – Chassis | 4.9 to 5.1 V |

4.12.6 Checking coolant temperature sensor continuity

1. Measure the resistance with an ohmmeter across the sensor 1 terminal and 2 terminal.
2. If the reference value is not indicated, the sensor is damaged.

<table>
<thead>
<tr>
<th>Resistance (1 terminal – 2 terminal)</th>
<th>Reference value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Approx. 11.08 Ω at 120 °C (248 °F)</td>
</tr>
<tr>
<td></td>
<td>Approx. 18.36 Ω at 100 °C (212 °F)</td>
</tr>
<tr>
<td></td>
<td>Approx. 31.8 Ω at 80 °C (176 °F)</td>
</tr>
<tr>
<td></td>
<td>Approx. 81.1 Ω at 50 °C (122 °F)</td>
</tr>
</tbody>
</table>

4.12.7 Checking hour meter and tachometer

1. Disconnect the 3P connector (4) from the IC regulator (9) located in the alternator (5) after starting the engine.
2. Measure the voltage with a voltmeter across the hour meter terminal (6) and the alternator body when the hour meter or tachometer does not indicate the proper value.
3. If the measured voltages differ from the specified voltage, the hour meter and tachometer are damaged.

Voltage while engine operates at idling speeds | Hour meter terminal – Alternator body | Approx. battery voltage

### 4.13 Accessory

#### 4.13.1 Checking DC outlet connector voltage

1. Disconnect the connector from the DC outlet and turn the main switch **ON**.
2. Measure the voltage with a voltmeter across the connector 1 terminal (R/L) and the chassis.
3. If the voltage differs from the battery voltage the wiring harness is damaged.

| DC outlet connector voltage | 1 terminal (R/L) – Chassis | Battery voltage |

#### 4.13.2 Checking DC outlet continuity

1. Disconnect the 20P connector (3) from the meter panel (1).

| 1 terminal | 2 terminal | Infinity |

### 4.14 Meter panel

#### 4.14.1 Checking connector voltage, sensor resistance and switch

1. Remove the DC outlet from the machine.
2. Measure the resistance with an ohmmeter across outlet 1 terminal and 2 terminal.

<table>

5. Disassembling and assembling

5.1 Starter

5.1.1 Disassembling starter motor

1. Disconnect the connecting lead (9) from the magnet switch (8).
2. Remove the screws (6), and then separate the end frame (4), yoke (2) and armature (1).
3. Remove the two screws (5), and then remove the brush holder (3) from the end frame (4).

(When reassembling)
- Apply grease to the spline teeth (A) of the armature (1).

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Nut (7)</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.9 to 11.8 N·m</td>
<td>0.6 to 1.2 kgf·m</td>
</tr>
<tr>
<td>4.3 to 8.7 lbf·ft</td>
<td></td>
</tr>
</tbody>
</table>
5.1.2 Removing magnet switch

1. Remove the drive end frame (1) mounting screws.
2. Remove the overrunning clutch (2), ball (3), spring (4), gears (5), rollers (6) and retainer (7).

(When reassembling)
- Apply grease to the gear teeth of the gears (5) and overrunning clutch (2), and ball (3).

5.1.3 Removing plunger

1. Remove the end cover (1).
2. Remove the plunger (2).

5.2 Alternator

5.2.1 Removing pulley

1. Secure the hexagonal end of the pulley shaft with a double-ended ratchet wrench as shown in the figure, loosen the pulley nut with a socket wrench and remove it.

5.2.2 Removing rear end cover

1. Remove the three rear end cover screws and the B terminal nut, and remove the rear end cover.

5.2.3 Removing brush holder

1. Remove the two screws holding the brush holder, and remove the brush holder (1).
5.2.4 Removing IC regulator
1. Remove the three screws holding the IC regulator, and remove the IC regulator (1).

5.2.5 Removing rectifier
1. Remove the four screws holding the rectifier and the stator lead wires.
2. Remove the rectifier (1).

5.2.6 Removing rear end frame
1. Remove the two nuts and two screws holding the drive end frame and the rear end frame.
2. Remove the rear end frame (1).

5.2.7 Removing rotor
**IMPORTANT**
• Take special care not to drop the rotor and damage the slip ring or fan, etc.
1. Press out the rotor (1) from drive end frame (3).
5.2.8 Removing retainer plate
1. Remove the four screws holding the retainer plate, and remove the retainer plate (1).

5.2.9 Removing bearing on drive end side
1. Press out the bearing from drive end frame (3) with a press and jig (1).

5.2.10 Removing bearing at slip ring side
1. Lightly secure the rotor (1) with a vise to prevent damage, and remove the bearing (2) with a puller (3).

6. Servicing
6.1 Starter
6.1.1 Checking overrunning clutch
1. Inspect the pinion for wear or damage.
2. If there is any problem, replace the overrunning clutch assembly.
3. Check that the pinion turns freely and smoothly in the overrunning direction and does not slip in the cranking direction.
4. If the pinion slips or does not rotate in the both directions, replace the overrunning clutch assembly.
6.1.2 Checking commutator and mica

1. Check the contact face of the commutator for wear, and grind the commutator with emery paper if it is slightly worn.

2. Measure the commutator O.D. with an outside micrometer at several points.

3. If the minimum O.D. is less than the allowable limit, replace the armature.

<table>
<thead>
<tr>
<th>Commutator O.D.</th>
<th>Factory specification</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>30.0 mm 1.181 in.</td>
<td>29.0 mm 1.142 in.</td>
</tr>
</tbody>
</table>

4. If the difference of the O.D.’s exceeds the allowable limit, correct the commutator on a lathe to the factory specification.

<table>
<thead>
<tr>
<th>Difference of O.D.’s</th>
<th>Factory specification</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Less than 0.02 mm 0.0008 in.</td>
<td>0.05 mm 0.0020 in.</td>
</tr>
</tbody>
</table>

5. Measure the mica undercut.

6. If the undercut is less than the allowable limit, correct it with a saw blade and chamfer the segment edges.

6.1.3 Checking brush wear

1. If the contact face of the brush is dirty or dusty, clean it with emery paper.

2. Measure the brush length (A) with vernier calipers.

<table>
<thead>
<tr>
<th>Brush length (A)</th>
<th>Factory specification</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>14.0 mm 0.551 in.</td>
<td>9.0 mm 0.354 in.</td>
</tr>
</tbody>
</table>
6.1.4 Checking brush holder
1. Check the continuity across the brush holder and the holder support with an ohmmeter.
2. If it conducts, replace the brush holder.

6.1.5 Checking armature coil
1. Check the continuity across the commutator and armature coil core with an ohmmeter.
2. If it conducts, replace the armature.
3. Check the continuity across the segments of the commutator with an ohmmeter.
4. If it does not conduct, replace the armature.

6.1.6 Checking field coil
1. Check the continuity across the lead (1) and brush (2) with an ohmmeter.

   (1) Lead  (2) Brush

2. If it does not conduct, replace the yoke assembly.
3. Check the continuity across the brush (2) and yoke (3) with an ohmmeter.
4. If it conducts, replace the yoke assembly.

6.2 Alternator

6.2.1 Checking bearing
1. Check the bearing for smooth rotation.
2. If it does not rotate smoothly, replace it.
6.2.2 Checking stator

1. Measure the resistance across each lead of the stator coil with resistance range of circuit tester.
2. If the measurement is not within factory specification, replace it.
3. Check the continuity across each stator coil lead and core with resistance range of circuit tester.
4. If infinity is not indicated, replace it.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Factory specification</th>
<th>Less than 1.0 Ω</th>
</tr>
</thead>
</table>

6.2.3 Checking rotor

1. Measure the resistance across the slip rings.
2. If the resistance is not the factory specification, replace it.
3. Check the continuity across the slip ring and core with resistance range of circuit tester.
4. If infinity is not indicated, replace it.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Factory specification</th>
<th>2.9 Ω</th>
</tr>
</thead>
</table>

6.2.4 Checking slip ring

1. Check the slip ring for score.

6.2.5 Checking brush wear

1. Measure the brush length with vernier calipers.
2. If the measurement is less than allowable limit, replace it.
3. Make sure that the brush moves smoothly.
4. If the brush is damaged, replace it.

<table>
<thead>
<tr>
<th>Brush length</th>
<th>Factory specification</th>
<th>10.5 mm 0.413 in.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Allowable limit</td>
<td>8.4 mm 0.331 in.</td>
</tr>
</tbody>
</table>
6.2.6 Checking rectifier

1. Check the continuity across each diode of rectifier with resistance range of circuit tester. The rectifier is normal if the diode in the rectifier conducts in one direction and does not conduct in the reverse direction.
9. MOWER
1. Structure of power transmission of mower

The power is transmitted from mid-PTO to blades as follows.

**Center blade**
Mid-PTO shaft (5) → Universal joint (4) → Pinion shaft (3) → Bevel gear (1) → Bevel gear (2) → Bevel gear shaft (8) → Center blade (6)

**Outer blade**
Mid-PTO shaft (5) → Universal joint (4) → Pinion shaft (3) → Bevel gear (1) → Bevel gear (2) → Bevel gear shaft (8) → Center pulley (7) → Mower belt (9) → Outer pulley (11) → Blade shaft (10) → Outer blade (12)
2. Structure of lifting mechanism of mower

**CAUTION**

- Never operate mower in transport position.

The lifting of mower is performed by the hydraulic system installed on the tractor. The mower should be kept lift when traveling. When the position control lever is moved to **LIFT** position, the lift arm (6) is lifted up by the oil pressure of hydraulic system, and the rear lift link (L.H.) (5) is pulled rearward. Therefore, rear lift links (4), (5) rotate and the mower is lifted by the lift links (3) and rear links (2). As this link system is a parallel linkage, the mower can be kept parallel at every position.

![Diagram of lifting mechanism](image)

**RELATED PAGE**

**TIGHTENING TORQUES on page 2-13**
4. Setting up mower [RCK54D-26BX and RCK60D-26BX]

4.1 Assembling mower

**DANGER**
To avoid serious injury or death:
- Do not operate the mower without the discharge deflector properly in position.

1. Place the mower on blocks as illustrated.
2. Attach all the anti-scalp rollers to the arms of the deck. Put clevis pins from outside and snap rings inside in the F position. 4.5 holes (X) must be visible.
3. Attach the discharge deflector to the deck with the spring (9), discharge pin (10) and cotter pin (11). Secure the spring to the discharge deflector as illustrated.

4.2 Setting mower

**WARNING**
To avoid serious injury:
- Park the tractor on a firm, flat and level surface, set the parking brake, stop the engine and remove the key.
- Clean up mower deck, slope and frame link. Make sure there is no debris inside the universal joint.
- Check all functions work correctly.
- Remove the front loader, front attachment and 3 point hitch attachment.

1. Adjust all the anti-scalp rollers to the F position. 4.5 holes (X) must be visible. (See in “Assembling mower”)
2. Unlock the lever (1) to lift up the rear anti-scalp roller.
3. Pull the L-pin (2) and extend the ramp (3) to front and rear sides.

4.3 Mounting front link

**CAUTION**
To avoid personal injury:
- Attach the stay link left and right. Do not loosen both left and right side nuts at the same time.

1. Place all front link and frame link under the tractor.
2. Attach the stay link (1) with the nut (2) on the tractor front frame.

3. Attach the front link (6) to the stay link (1) with joint pin (3), washer (4) and snap pin (5).

4. Before attaching the mower links, adjust lengths (L1) to 22 mm.
4.4 Mounting frame link

1. Place blocks below the frame link if one person does the setting. Heights of blocks are recommended value for attaching.
2. Start engine. Set the cutting height to 0" and lower the frame link. Then stop the engine.
3. Attach the frame link to the link arm.
4. Joint the front link and frame link with joint pin and snap ring.
5. Attach the universal joint to tractor.

4.5 Setting tractor

1. Make sure that the frame link (1) is lifted up to the TOP position when tractor is traveling without mower. Stop the tractor behind the mower. Set the parking brake.
2. Set the cutting height to 0" and lower the frame link (1). Then stop the engine.
3. Make sure that the rear lock (2) is unlocked.
4. Make sure that the universal joint (3) is in rear position.
5. Make sure that the frame link (1) is fully down.

**4.6 Mounting mower**

**WARNING**

To avoid serious injury:
- If mower moves forward before the tractor rides on, there is less grip between the ground and mower. Change area and try again.

1. Start the engine and engage 4WD. Set the range gear shift lever to **LOW**. Release the parking brake.
2. With the right front tire, make a driving target to the guide (1).
3. Drive over the ramp of mower along the guide (1). Keep the front tire side touching the guide rod.
4. Just after the tractor drove over the mower, stop the engine. Make sure frame link is connected to mower. Set the parking brake.
5. Lock the rear lock (2).

**WARNING**

To avoid serious injury:
- Double check that frame link is locked to mower deck.

6. Set the PTO select lever to **Rear-PTO** position.
7. Connect the universal joint by the lever guide (3).
8. Lock the lever guide by the lock lever (4).

**WARNING**

To avoid serious injury:
- Double check that lever guide is locked.

9. Set the PTO select lever to **Mid-PTO** position.
10. Put front and rear ramps (5) back to the ramp bracket (6). Lock the L-pin (7).
11. Start the engine. Lift up the mower to the **TOP** position. Lock the dial gauge and set the parking brake. And then, stop the engine.

---

**SERVICING**

4. Setting up mower [RCK54D-26BX and RCK60D-26BX]

9. MOWER
12. Lock the rear anti-scalp roller (8).

5. Checking and adjusting

5.1 Mower adjustment

**CAUTION**
- Park the tractor on a firm, flat and level surface and set the parking brake.
- Stop the engine, remove the key, and allow the blades to stop before making adjustments.
- Wear heavy gloves or wrap end of blade with a rag when you handle blades.
- Before starting the engine, set the PTO clutch lever to off position and range gear shift lever to the neutral position.

5.1.1 Adjusting mower link

**IMPORTANT**
- Park the machine on a firm, flat and level surface and set the parking brake.
- Before adjusting mower deck, make sure the tire pressure is correct.

1. Move the hydraulic control lever rearward to raise the mower to the highest position.
2. Stop the engine and remove the key.
3. Adjust the left side links with bolt so that the clearance (L) is as follows.

<table>
<thead>
<tr>
<th>Clearance (L) between stopper and rear link</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 to 0.5 mm (0 to 0.01 in.)</td>
<td>0 to 0.5 mm 0 to 0.01 in.</td>
</tr>
</tbody>
</table>

5.1.2 Adjusting front and rear cutting height

RCK54D-26BX and RCK60D-26BX

**IMPORTANT**
- Park the machine on a firm, flat and level surface and set the parking brake.
- Before adjusting mower deck, make sure the tire pressure is correct.
5.1.3 Adjusting left and right cutting height

**IMPORTANT**
- Park the machine on a firm, flat and level surface and set the parking brake.
- Before adjusting mower deck, make sure the tire pressure is correct.

1. Turn the cutting height control dial to **2.0** and adjust the anti-scalp roller's height to factory specified clearance between the rollers and the ground.

<table>
<thead>
<tr>
<th>Clearance between rollers and ground</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0 to 13 mm 0.25 to 0.50 in.</td>
<td></td>
</tr>
</tbody>
</table>

2. Align the ends of the right side blade towards the front and rear of the machine. Turn blade by hand in either direction.

3. Adjust (L1) of the front links with lock nuts (2), (3) so that (A) is within factory specification ((A) = (Y) – (X)).

<table>
<thead>
<tr>
<th>Difference (Y) – (X) (Y ≥ (X)) between front tip and rear tip of blade</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0 to 5.0 mm 0.00 to 0.20 in.</td>
<td></td>
</tr>
</tbody>
</table>

4. To adjust (L1), loosen lock nuts (2) then turn lock nuts (3). Rotate both lock nuts (3) at the same time to set L.H. and R.H. (L2) in even length.

5. Tighten lock nuts securely

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Front link lock nut</th>
</tr>
</thead>
<tbody>
<tr>
<td>60 to 70 N·m 6.2 to 7.1 kgf·m 45 to 51 lbf·ft</td>
<td></td>
</tr>
</tbody>
</table>
1. Operate the hydraulic control lever (2) rearward to raise the mower deck to the highest position.
2. Stop the engine and remove the key.
3. Turn the cutting height control dial to the desired height.
4. Set the anti-scalp roller's height to keep clearance between rollers and the ground inside specification shown below.

<table>
<thead>
<tr>
<th>Clearance between rollers and ground</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>6 to 13 mm</td>
</tr>
<tr>
<td></td>
<td>0.2 to 0.5 in.</td>
</tr>
</tbody>
</table>

5. Lower the mower deck by moving the hydraulic control lever forward.

6. Turn left blade by hand parallel to tractor axle and turn right blade parallel to axle to measure from the outside blade tip at (L) and (R) to the level surface. The difference between measurement should be less than the factory specification.

<table>
<thead>
<tr>
<th>Difference (L) – (R) between left tip and right tip of blade</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Less than 3 mm</td>
</tr>
<tr>
<td></td>
<td>0.12 in.</td>
</tr>
</tbody>
</table>

7. If the difference between measurement is more than the factory specification, loosen the lock nut of the left side.

8. Adjust the cutting height fine turning bolts so that the difference between measurement (L) and (R) is less than the factory specification. Then lock the nut.

### 5.1.4 Adjusting cutting height

**DANGER**
- Never operate the mower in transport position.

**IMPORTANT**
- (for self-balance suspended linkage)
  To reduce the stepped difference in cutting height when mowing rolling terrain, follow the procedure below.
1. To set the cutting height, move the hydraulic control lever rearward to raise the mower to the highest position. Turn the cutting height control dial (1) to adjust height.

2. Set the anti-scalp roller’s (3) height as shown to keep clearance between rollers and ground.

3. Lower the mower deck by moving the hydraulic control lever (2) forward.

4. Use the higher settings for mowing in a rough area or when mowing tall grass. Lower settings should be used only for smooth lawns where short grass is desired.

5. To set the cutting height, move the hydraulic control lever (2) rearward to raise the mower to the highest position. Turn the cutting height control dial to adjust height.

6. Set the anti-scalp roller’s (3) position as shown to have the same cutting height.

5.2 Checking mower blade and belt

5.2.1 Checking mower blade

1. Check the cutting edge of mower blade.

2. Sharpen the cutting edges, if the mower blades are as shown in figure (2).

**NOTE**
- To sharpen the mower blades by yourself, clamp the mower blade securely in a vise and use a large mill file along the original bevel.
- To balance the mower blade, place a small rod through the center hole and check to see if the blade balance evenly. File heavy side of the blade until it balance out even.

3. Replace the mower blades, if they are as shown in figure (3).

**IMPORTANT**
- Never forget to set the dust cover, cup washer(s) and lock washer, when reassembling the mower blades. (See “Removing mower blades”.)

5.2.2 Checking mower belt

1. Check to see the mower belt.

2. Replace the mower belt with a new one, if there is found surface split at more than three positions.

**WHEN REPLACING MOWER BELT**

**IMPORTANT**
- After setting the gear box bracket mounting screws on the deck without tightening, then mount the other screws on the gear box. And finally tighten them.

---

**Tightening torque**

6. Disassembling and assembling

6.1 Removing ramps and belt covers

RCK54D-26BX and RCK60D-26BX

1. Remove left and right ramp bracket pins.
2. Remove left and right ramps (1), (2).
3. Remove the left and right belt covers (3), (4).

6.2 Removing mower blades

NOTE
- To remove the blade securely, wedge a block of wood between one blade and the mower deck in such position that it will hold the blade safely while loosening or tightening the blade screw.

(A) 30.2 mm (1.19 in.)

1. Turn over the mower.
2. Remove the blade mounting bolt (6), lock washer (5), cup washers (4), mower blade (3) and spindle guard (2) from the spindle holder (1).

(When reassembling)

IMPORTANT
- Make sure the cup washer is not flattened out or worn, causing blade to slip easily. Replace cup washers if either are damaged.

1. Remove the external snap ring (2).
2. Remove the blade boss (1).
6.4 Removing gear box and mower belt

1. Turn over the mower.
2. Remove the mower belt (3) from the tension pulley (5).
3. Remove the left and right gear box mounting screws (2), (4) and remove the gear box (1) from the mower deck.

(When reassembling)
- Install the reamer screws (2) at their original positions as shown in the figure.

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

6.5 Disassembling gear box

1. Remove the drain plug (1), and drain the gear box oil.
2. Remove the center pulley (20) with a puller, and remove the feather key (18) on the bevel gear shaft (19).
3. Remove the gear box cap (5).
4. Remove the oil seal (10), internal snap ring (11) and shim (12).
5. Tap out the pinion shaft (14) with the ball bearing (13), and remove the bevel gear (4).
6. Remove the ball bearing (3) and shims (if installed).
7. Remove the external snap ring (6), and draw out the bevel gear shaft (19).
8. Remove the bevel gear (7), ball bearing (8), shim (9) and oil seal (17).

(When reassembling)
- Replace the oil seals (10), (17) and gear box cap (5) with new ones.
- Check the backlash and turning torque. If not proper, adjust with the shims to specification.

— RELATED PAGE —
7.1 Adjusting turning torque of pinion shaft on page 9-18
6.6 Removing center pulley holder

1. Remove the center pulley holder bolt (1), (15) / center pulley nut (5), (11).
2. Remove the upper oil seal (6) and lower oil seal (4).
3. Remove the internal snap ring (3) and ball bearing (2).

(When reassembling)

**NOTE**

- When reassembling the center pulley holder (14), gear box and gear box bracket (9), (10), tighten the bolts and nuts in the order as below, to prevent the incline the gear box.
- Tighten the reamer screw (12) to the gear box first, then tighten the reamer bolts (15) and nut (11) to the center pulley holder (14) with specified torque.
- Tighten the gear box screws (8) to the gear box and then tighten the center pulley holder bolts (1) and nut (5) with specified torque.
- Replace the oil seals (4), (6) with new ones.
- Install the reamer screw (12) / reamer bolt (15) at their original positions as shown in the figure.

---

6.7 Removing outer pulley and blade shaft

1. Remove the outer pulley mounting nut (2), and remove the outer pulley (6).
2. Remove the outer pulley holder mounting nut (10), and remove the outer pulley holder (15).
3. Remove the oil seal (12) and tap out the blade shaft (19) with the ball bearing (17) and (13), being careful not to damage the grease fitting (1).
4. Remove the ball bearing (13), and collar (14) from the blade shaft (19).
5. Remove the ball bearing (17), and oil seal (18).

(When reassembling)

- Replace the oil seals (12) and (18) with new ones.
7. Servicing

7.1 Adjusting turning torque of pinion shaft

1. Set the blade screw (4) for the blade shaft to measure the turning torque.
2. Turn the blade screw (4) clockwise with torque wrench and measure the turning torque.

### Turning torque

7.2 Adjusting backlash between bevel gears

1. Remove the gear box cap (3).
2. Place the plastigauges or wire of solder the bevel gear (2) on the input shaft (5).
3. Turn the input shaft (5).
4. Remove the plastigauges or wire of solder, and measure the thickness with the gauge or an outside micrometer.
5. If the backlash exceeds the allowable limit, adjust it with shims (1), (4), (6).

10. FRONT LOADER
The hydraulic system of this tractor and front loader has a hydraulic pump, control valve for front loader, 3 point hitch system and other components. This system has the following functions:

1. Oil is supplied by hydraulic pump which is operated by pump drive shaft in the transmission case. As the pump drive shaft is connected to the propeller shaft, hydraulic pump starts operating when engine starts.
2. The hydraulic pump supplies the high pressured oil to control valve for front loader, control valve for 3 point hitch system, power steering controller, PTO clutch valve and hydrostatic transmission after dividing oil flow by flow priority valve.
### Specification of hydraulic parts

2. Front remote hydraulic control system (if equipped)

You can use the front remote hydraulic control system for a front mounted hydraulic implement. The front remote hydraulic control system provides hydraulic oil to the front outlet directly.

2.1 Operating control lever

⚠️ WARNING

To avoid personal injury or death
• Valve lock does not lock out switch-operated third-function hydraulics, which are active when the key switch and the front hydraulic valve main switch are on.

1. Turn the front-hydraulic-valve-main-switch on.
   a. Push the front-hydraulic-valve-main-switch to engage the front-hydraulic-valve.
   The light on the front-hydraulic-valve-main-switch will illuminate to indicate that the front-hydraulic-valve is on and to enable the activation switch and operation of the lever.

2. Turn the activation switch on or off.
   • When operating the lever to left side with pressing the activation switch, hydraulic oil will come out of port 1 and return through port 2 as long as operating the lever to left side with pressing the activation switch.
   • When operating lever to right side with pressing the activation switch, hydraulic oil will come out of port 2 and return through port 1 as long as operating lever to right side with pressing the activation switch.

3. Turn the front-hydraulic-valve-main-switch off.
   a. Push the front-hydraulic-valve-main-switch again to disengage the front hydraulic valve.
   The light of the front-hydraulic-valve-main-switch will turn off.

IMPORTANT
• While a front mounted hydraulic attachment is used, make sure that the hydraulic hose is routed out of contact with the left and right bucket links. Keep the hose from running over within the circled zone in the following figure.
3. Boom cylinder and bucket cylinder

3.1 Structure of boom cylinder and bucket cylinder

Both boom cylinder and bucket cylinder consist of a head (4), cylinder tube (3), piston rod (5), piston (2), and other parts as shown in the figure below. They are single-rod double acting cylinder in which the reciprocating motion of the piston is controlled by hydraulic force applied to both of its ends.

### Cylinder specifications

<table>
<thead>
<tr>

<td>196 mm (7.72 in.)</td>
</tr>
</tbody>
</table>
4. One touch front loader
4.1 Outline of one touch front loader
One touch front loader is adopted to BX80 series tractor. The operator can attach and disconnect the front loader quickly and safely without getting down from the tractor. The main component parts are shown in the figure.

5. One lever quick touch 4 lines coupler
5.1 Structure of one lever quick touch 4 lines coupler
The quick touch coupler allows to attach and remove the quick coupler. The quick coupler is divided to the upper part and the lower part. The upper part consists of the quick coupler lever (2) and the mobile quick coupler (4) with four hydraulic hoses (3).
The lower part consists of the quick coupler base (5) with four hydraulic pipes (6). It is installed to the loader main frame (1). Non-spill structure is adopted in the couplers on the quick coupler base to protect the oil leakage from the hydraulic oil line.

6. Auto lock attachment and detachment
6.1 Outline of auto lock attachment and detachment
The side frame (5) is mounted on the main frame (1). The side frame (5) can be locked or freed by controlling the mounting lever (3) on the lever guide (4). When the bucket is lifted up, the side frame (5) and the main frame (1) are locked. When the front wheels are lifted up by lowering the bucket to the ground, the operator can control the mounting lever (3) easily and release the hook (2) mounted on the main frame by hand.
6.2 Function of auto lock attachment and detachment

When the mounting lever (3) is moved to the upper position of the lever guide (4), the hook (2) is unlocked from the main frame (1). As a result, the side frame (5) can be disconnected from the main frame (1).

Free position

When the mounting lever (3) is moved to the lower position of the lever guide (4), the hook (2) is locked to the main frame (1). As a result, the side frame (5) is locked to the main frame (1).

7. Mechanical loader frame standing mechanism

7.1 Structure of mechanical loader frame standing mechanism

The loader stand (1) is fixed to the loader arm (2) by the stand hooks (5). These stand hooks (5) can be controlled by moving the stand lever (3). The stand rod (4) is connecting the stand lever (3) and the stand hooks (5). When the stand lever (3) is moved downward, the stand hooks (5) are pulled in and free the loader stand (1) from the loader arm (2).
8. 3rd function valve (If equipped)

8.1 Structure of 3rd function valve

P1: P1 port
P2: P2 port
A: A port
B: B port
C: C port
D: D port
8.2 Function of 3rd function valve

8.2.1 Activation switch in off position

1. When the activation switch in off position, the spool of 3rd function valve doesn't move. The oil passage from P1 port to A port and the oil passage from P2 port to D port are opened.

2. When the loader control lever is set to the dump position, the hydraulic oil enters from P1 port and exits at B port. This extends the bucket cylinder.

3. Return oil from the bucket cylinder enters C port and travels throughout the valve to go to the transmission case through P2 port.

**NOTE**

When the loader control lever is set to the roll-back position, the hydraulic oil enters from P2 port and exits at C port. This extends the bucket cylinder. Return oil from the bucket cylinder enters B port and travels throughout the valve to go to the transmission case through P1 port.
8.2.2 Activation switch in on position

1. When the activation switch is in on position, the spool of 3rd function valve moves to the right. This creates an oil passage from P1 port to A port. The oil passage from P2 port to D port is also opened.

2. When the loader control lever is set to the dump position, the hydraulic oil enters from P1 port and exits at A port. This extends the 3rd function cylinder.

3. Return oil from the 3rd function cylinder enters D port and travels throughout the valve to go to the transmission case through P2 port.

**NOTE**

When the loader control lever is set to the roll-back position, the hydraulic oil enters from P2 port and exits at D port. This extends the 3rd function cylinder. Return oil from the 3rd function cylinder enters A port and travels throughout the valve to go to the transmission case through P1 port.

3. Checking and adjusting

3.1 Loader stand

3.1.1 Adjusting height of loader stand

1. Make sure that the stand lever is at its low position as shown in the following figure.

2. Raise the boom until the bucket fulcrum pin comes up to the height of the boom fulcrum pin.
3. Roll back the bucket to maximum.

4. Stop the engine.
5. Apply the adjusting bolts to the right and left stand adjusting blocks as shown in the following figure.

6. Move the hydraulic control lever to the dump position, and check to see if the stands are folded as specified.
7. Fasten the seat belt, and start the engine.
8. Move the hydraulic control lever to the dump position until the hydraulic pressure gets relieved.
9. Lower the boom to put the bucket on the ground.

**IMPORTANT**
- Be sure to apply the bolts all the way to prevent the damage of the stand.

**NOTE**
- There is no need to tighten up the lock nuts.
10. Lift the stand on the right side of the loader up to the position shown in the following figure.

11. Reposition the adjusting bolt until it touches the stand.

**NOTE**
- The position of the bolt is provisional and may be roughly set for now.

12. Adjust the adjusting bolt in the same way as for the stand on the left side of the loader.

13. Position the stand lever as shown in the figure.

14. Turn the adjusting bolt on the right side of the loader to set the stand pin as shown as follows.

**IMPORTANT**
- Be careful not to allow the stands to go beyond their adjustable range. Otherwise the stands may get damaged.

15. Lock the stand pin using the lock nut.
16. Turn the adjusting bolt and lock the stand pin on the left side of the loader in the same way as for the right side.

17. Look at the right and left stands to make sure that the heads of the adjusting bolts are pressed upon the stands.

18. Be sure that the stands are parallel with the loader pipe.

**IMPORTANT**
- Double-check that the heads of the adjusting bolts are pressed upon the stands. Otherwise the stands may get damaged in storing them away.

19. Slide the stand lever in the upward direction and make sure that the stand gets locked.
20. Set the stand lever to the low position.

21. Fasten the seat belt.
22. Get the engine started, roll back the bucket and move up the boom, both to maximum.
23. Stop the engine.
24. Move the hydraulic control lever to the dump position until the bucket comes to a complete stop.
25. Make sure that the stands are folded as specified.
26. Fasten the seat belt.
27. Get the engine started and raise the engine speed up to the following speed.

| Engine speed | Factory specification | 1800 rpm |

28. Slowly dump the bucket until the stand touches the boom.
29. Slide the stand lever upward direction, and then slide the stand lever left side completely as shown in the following figure.

30. Hold the stand by stand hook.

3.2 Front hydraulic valve main switch and relay
3.2.1 Checking front hydraulic valve main switch continuity
1. Disconnect the front hydraulic valve main switch connector.
2. Measure the resistance with an ohmmeter between terminal RB and terminal B.
3. If 0 ohm is not indicated, replace the front hydraulic valve main switch.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Terminal RB – Terminal B</th>
<th>On position</th>
<th>0 Ω</th>
<th>Off position</th>
<th>Infinity</th>
</tr>
</thead>
</table>

**Switch side**

3.2.2 Checking connector voltage of front hydraulic valve main switch
1. Disconnect the front hydraulic valve main switch connector.
2. Turn the main switch on.
3. Measure the voltage between terminal RB and terminal B.

**Wire harness side**

4. If the measurement differs from the battery voltage, wire harness is damaged.

3.2.3 Checking relay
1. Remove the relay.
2. Apply battery voltage across terminals 3 and 4, and check for continuity across terminals 1 and 2.
3. If continuity is not established, renew the relay.
3.3 3rd function solenoid valve

3.3.1 Checking 3rd function solenoid valve continuity

1. Disconnect solenoid valve connector.

2. Measure the resistance with an ohmmeter between terminal 1 and terminal 2.

3. If the measurement greatly differs from specified value, replace the solenoid valve.

| Resistance | Approx. 3.8 Ω |

3.3.2 Checking connector voltage of 3rd function solenoid valve

1. Disconnect solenoid valve connector.

2. Turn the main switch on and push the front hydraulic valve main switch (ON position), then push the activation switch.

3. Measure the voltage between terminal 1 and terminal 2.

4. If the measurement differs from the battery voltage, wire harness is damaged.

4. Disassembling and assembling

4.1 Removing and attaching front loader

- To remove the loader, park the tractor on flat and hard ground, apply the parking brake. To start the engine or use the hydraulic control valve, always stay in the operator's seat.

4.1.1 Removing loader

- Make sure an approved bucket is attached before removing the loader from the tractor.
10. FRONT LOADER

- For removing the loader, choose flat and hard ground, preferably concrete.
- If the ground surface is soft, place suitable planks on the ground for the bucket and stands.
- When starting the engine or using the hydraulic control valve, always sit in the operator's seat.
- Make sure the bucket and stands are at ground level.

4.1.1.1 Removing loader

**WARNING**
- Make sure that an approved bucket is attached before removing the loader from the tractor.
- For removing the loader, choose flat and hard ground, preferably concrete.
- If the ground surface is soft, place suitable planks on the ground for the bucket and the stand.
- When starting the engine or using the hydraulic control lever, always sit in the operator's seat.
- Make sure that the bucket and the stand are at ground level.

1. Set the engine speed to the following speed, and then raise the boom until the bucket pin is the height of the boom fulcrum pin.

<table>
<thead>
<tr>
<th>Engine speed</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1800 rpm</td>
</tr>
</tbody>
</table>

2. Dump the bucket fully.

3. Slide the stand lever (3) downward direction completely, and release the stand (4) from the stand hook (5).

4. Roll the bucket back until its bottom is set at the following angle (B) with respect to the ground surface.

<table>
<thead>
<tr>
<th>Angle between ground surface and bucket bottom</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>(B)</td>
<td>About 20°</td>
</tr>
</tbody>
</table>
5. Lower the boom and raise the front wheels slightly.

![Diagram](1JDJD00065A01)

**IMPORTANT**
- When raising the front wheels, the stands are not to be grounded.

6. Slide the mounting levers (6) of both sides to the upward direction as shown in the following figure.

![Diagram](1JDJD00066A02)

(6) Mounting lever

7. Slowly move the hydraulic control lever (9) to the rollback position to raise the side frames of the loader up and out of the receivers of the main frames (7) as shown in the following figure.

![Diagram](1PS0W00058A02)

(7) Main frame
(8) Sub frame
(9) Hydraulic control lever

8. Down the mounting levers (10) of both sides as shown in the following figure.

![Diagram](1JDJD00066A03)

(10) Mounting lever

9. Back the tractor so that the quick coupler (11) is set at the back of side frame (12) as shown in the following figure.

![Diagram](1JDJD00066A02)

(11) Quick coupler
(12) Side frame

10. Stop the engine, and slowly release all hydraulic pressure by moving the hydraulic control lever in all directions.
11. Unfasten the seat belt, and then turn the safety lock button (13) counter-clockwise to unlock it.

12. Raise the lever (14) until it stops.

13. When the third function kit is mounted, remove the connector. Connect the caps to the connectors of mobile side and tractor side.

14. Put the mobile part on the coupler stay (17). Put the mobile part on the coupler stay (18) for cab model.
15. Place the protective caps and plugs on the ends of the quick coupler.

16. Fasten the seat belt and slowly back the tractor away from the loader.

4.1.2 Reinstalling loader

**CAUTION**

To avoid personal injury:
- To start the engine and operate the control valve, always stay in the operator's seat.

4.1.2.1 Installing loader

**WARNING**

To avoid personal injury or death:
- When starting the engine and operating the hydraulic control valve, always sit in the operator's seat.

1. Slowly drive the tractor between the side frames (1) of the loader until the rear portion of both side frames touches the main frames (2) as shown in the following figures.

**IMPORTANT**
- Get the quick coupler locked, and move up and down the lever to make sure that the quick coupler is tightly locked.
5. When mounting the third function kit, remove the caps (5) from the connectors of mobile side [C] and tractor side [D]. Connect the connectors (6) and the caps as shown in the follow figures.

6. Make sure that the mounting levers (7) of both sides are at their low position as shown in the follow figures.

7. Start the engine and operate at the following speed.

<table>
<thead>
<tr>
<th>Engine speed</th>
<th>Factory specification</th>
<th>1800 rpm</th>
</tr>
</thead>
</table>

8. Slowly move the hydraulic control lever to the up position until the guide bosses of both side frames (8) touch (C) the main frames (9).
9. Slowly move the hydraulic control lever to the **dump** position to lower the side frames into the main frames, and engage (D) the bosses of the main frames (11) to the guide bosses of the side frames (10).

10. Slowly move the control lever to the **dump** position until the bucket (12) tilts down as follows.

| Angle between bucket bottom and ground (E) | Factory specification | About 20° |

**IMPORTANT**
- Make sure that the tips of the stands are off the ground.

11. Slowly move the hydraulic control lever to the **down** position to lift the front wheels slightly with the loader until the mount hooks (14) are completely mounted on the main frame as shown in the following figure.

**IMPORTANT**
- Make sure that the hooks at both sides are properly mounted on the main frame.
- Make sure not to pinch the wire harness in the side frame when mounting the third function kit.

12. Slowly move the hydraulic control lever to the **up** position until the cutting edge of the bucket comes up slightly off the ground.
13. Make sure that the right and left mounting levers (18) cannot be activated. Do not use the machine if the cutting edge of the bucket is off the ground but the mount hooks (17) are unlocked.

14. Raise the boom until the bucket fulcrum pin (19) comes up to the height of the boom fulcrum pin (20).

15. Make sure that the stand lever (21) is at its low position as shown in the following figure.

16. Slowly dump the bucket until the stand touches the boom.

17. Slide the stand lever (21) upward direction, and then slide the stand lever left side completely as shown in the following figure.

18. Hold the stand (22) by the stand hook (23).

4.2 Bucket, boom and hydraulic cylinders

4.2.1 Attaching attachments

**DANGER**

To avoid personal injury or death
- Use of a non-KUBOTA attachment that does not comply with ISO24410 or the improper positioning of handle(s) or non-protrusion of pin(s) may result in detachment of the attachment or deformation, causing loss of performance, personal injury, or death.

**NOTE**
- Locate the attachments on a flat, firm surface when attaching and removing them from the quick attach coupler.

The quick attach coupler is designed to be used with KUBOTA attachments. To use non-KUBOTA attachments, it must comply with ISO 24410, first edition 2005-04-15. The quick attach coupler allows the
operator to change the attachments easily without the use of tools.

1. To mount an attachment, pull the quick attach coupler handles to the unlatched position to release the latching pins. Move the quick attach coupler handles all the way up to ensure that the latching pins are fully retracted.

2. Position the tractor squarely in front of the attachment and tilt the quick attach coupler forward with the bucket cylinder.

3. Ease the quick attach coupler mounting plate into the saddle of the attachment.

4. Roll the quick attach coupler back using the bucket cylinder and raise the boom slightly. The back of the attachment should rest against the front of the quick attach coupler mounting plate, and the weight of the attachment should be supported by the loader.

**CAUTION**

To avoid personal injury or machine damage:
- Raise the boom only enough to latch the attachment.
  The attachment could swing off the quick attach coupler.

5. When the attachment is properly seated in the saddle and against the front of the quick attach coupler mounting plate, turn off the engine and set the parking brake.

6. Push the quick attach coupler handles to the fully latched position.
7. Verify that both latching pins are completely engaged in the base of the attachment.

**DANGER**

To avoid personal injury or death:
- The following engagement points are critical.
  - The lock pins of the quick attach coupler have to protrude into and through the pin slots of the attachment on both sides.
  - It is critical that the lock pins are in good condition and without visible signs of wear or damage.
  - It is critical that the operator align the quick attach coupler of the loader with the attachment to allow the lock pins to go through the pin slots.
  - Push down both quick attach coupler handles until they contact the ear plates near the points where the pin bolt goes through the handle.
- Do not operate the tractor or attachment unless all of the preceding conditions are met.

8. When pushing the quick attach coupler handles into the **locked** position, visually verify that the latch pins rotate completely and are located underneath the stop of the quick attach coupler.

9. When attaching different attachments, visually inspect for broken or damaged pins. If broken or damaged pins are found, replace before using. Use of broken pins may result in detachment or deformation of the attachment, causing loss of performance, personal injury, or death.

You are now ready to use the attached attachment.

Attach and remove all compatible attachments using the same method.

**WARNING**

To avoid personal injury, death, or machine damage:
- Never operate or transport the attachments which are not attached properly.
- Always replace damaged hardware immediately.

### 4.2.2 Removing attachments

Remove the attachments in the reverse procedure of attaching the attachments.

1. Lower the attachment to ground level with the attachment slightly in the rolled back position.
2. Stop the engine and set the parking brake.
3. Pull the quick attach coupler handles to the unlatched position to release the latching pins.
4. While sitting in the operator's seat of the tractor, start the engine and slowly move the loader control lever to the dump position until the attachment is pushed away slightly from the quick attach coupler.
5. Lower the boom of the loader so that the quick attach coupler mounting plate clears the attachment saddle.
6. Back away from the attachment slowly.
7. If an attachment is not going to be attached to the quick attach coupler immediately, push the quick attach coupler handles to the locked position to prevent damage to the handle assembly.
4.2.3 Removing bucket cylinder

**CAUTION**
To avoid personal injury:
• Before you disconnect hydraulic hoses, be sure to release all pressure.

1. Disconnect the hydraulic hoses from the bucket cylinder.
2. Remove lower pin and upper pin and remove the bucket cylinder (1).

(When reassembling)
• To install the bucket cylinder (1), the hydraulic port must point inside and be careful of the direction of grease fittings.

4.2.4 Removing boom cylinder and hydraulic tubes

1. Disconnect the hydraulic hoses from the boom cylinders (4).
2. Remove the pins (2) and remove the boom cylinders (4).
3. Disconnect the hydraulic hoses (6) with quick couplers at the control valve.
4. Remove the pins (1) and remove the boom (3) from the side frame (5).
5. Remove the hydraulic tubes (7) from the boom (3).

(When reassembling)
• To install the boom cylinders (4), the hydraulic port must point inside and be careful of the direction of grease fittings.

4.2.5 Removing piston rod assembly

1. Drain hydraulic oil from the cylinder, and secure the tube end of the cylinder in a vise.
2. Remove the cylinder head (1) with the adjustable gland nut wrench (4).
3. Pull out the piston rod assembly (2) from the cylinder tube (3).

(When reassembling)
- Visually inspect the cylinder tube for signs of scoring or damage.
- Put the piston rod assembly to the cylinder tube. Be careful not to cause damage to the piston seal on the piston.
- Install the cylinder head to the cylinder tube. Be careful not to damage the O-ring on the cylinder head.

4.2.6 Removing cylinder head, piston and nut
1. Hold the rod end in a vise.
2. Remove the nut (4), and remove the piston (3) and cylinder head (2) from the piston rod (1).

<table>
<thead>

</tr>
</tbody>
</table>
4.2.7 Removing piston seal and O-ring
1. Remove the piston seal (2) and O-ring (3) from the piston (1).

![Diagram of piston, seal, and O-ring]

**IMPORTANT**
- To install the O-ring (3) and piston seal (2) to the piston (1), use the slide jig and correcting jig as shown in special tools of GENERAL section.

4.2.8 Installing O-ring and piston seal
1. Set the slide jig (2) on the piston (4).
2. Install the O-ring (3) to the piston using the slide jig.
3. Install the piston seal (1) over the O-ring using the slide jig.

**NOTE**
- Do not turn (roll) the piston seal as you install it.

4. Compress the piston seal to the correct size by installing the piston into the correcting jig (5).

4.3 Side frames, front guard and main frames
4.3.1 Removing side frames
1. Remove the pins (2), (5).
2. Remove the side frames (1) from the boom assembly (3) and the boom cylinder (4).

4.3.2 Removing front guard
1. Remove the front guard (1).

4.3.3 Removing main frames
1. Remove the main frame mounting bolts and nuts (2) from the tractor body.
2. Remove the main frame (1).

(When reassembling)

**IMPORTANT**
- Be careful not to pinch the wire harness when assembling the main frame.
- Tighten to the specified tightening torque.

4. If the measurement is more than the allowable limit, replace it.
11. ВАСКНОЕ
MECHANISM

1. Hydraulic circuit

To operate the backhoe, the hydraulic oil is first pressurized by the hydraulic pump. Oil then flows from pump port P through six control valves (the bucket control valve, the dipperstick control valve, the stabilizer R.H. control valve, the stabilizer L.H. control valve, the boom control valve and the swing control valve) to P.B. port (to front loader control valve).

Since the relief valve is not equipped in the backhoe control valve, the main relief valve in the tractor operates.

2. Control valve

2.1 Structure of backhoe control valve

**Inlet section**
This section has P and T ports.
The P port is connected to the outlet port of tractor connected by the quick coupler.
The T port is connected to the transaxle case by the quick coupler.

**Control valve section**
The control valves are of three positions, six connections, no detent, spring center type. This valve has A and B ports and control oil flow to each cylinders.
The control valves consist of a valve housing, spool, load check valve, overload relief valve, etc.

**Outlet section**
This section has P.B. port which is connected to the inlet port of hydraulic block or front loader control valve.

2.2 Function of backhoe control valve

2.2.1 Backhoe control valve in neutral position

1. Pressure-fed oil from the hydraulic pumps is delivered into the P port in the outlet section (8).
2. As the load check valves (9) are kept closed in the neutral position, oil flows along the notched section of the spools (10) to the P.B. port through the neutral passage (11).
3. Oil is then fed to the front loader valve or transaxle case and pipe from the P.B. port.

KiSC issued 03, 2017 A
2.2.2 Backhoe control valve in swing right position

1. When the boom and swing lever is moved to the right to set to the right position, the spool (4) of the swing control valve moves to the right, which forms oil passage between bridge passage (6) and A6 port, and between B6 port and T port.

2. The pressure-fed oil from the P port opens the load check valve (2) and flows to B6 port to extend the swing cylinder.

3. Return oil from the swing cylinders return to the transmission case through the A6 port, low pressure passage and T port.
2.2.3 Backhoe control valve in swing left position

1. When the boom and swing lever is moved to the left to set to the left position, the spool (4) of the swing control valve moves to the left, which forms oil passage between bridge passage (6) and A6 port, and between B6 port and T port.
2. The pressure-fed oil from the P port opens the load check valve (2) and flows to A6 port to shrink the swing cylinder.
3. Return oil from the swing cylinders return to the transmission case through the B6 port, low pressure passage and T port.
2.2.4 Backhoe control valve in boom up position

1. When the boom and swing lever is pulled to the backward to set to the up position, the spool (4) of the boom control valve moves to the left, which forms oil passage between bridge passage (6) and B5 port, and between A5 port and T port.
2. The pressure-fed oil from the P port opens the load check valve (2) and flows to B5 port to retract the boom cylinder.
3. Return oil from the boom cylinder returns to the transmission case through the A5 port, low pressure passage and T port.

2.2.5 Backhoe control valve in boom down position

1. When the boom and swing lever is pulled to the forward to set to the down position, the spool (4) of the boom control valve moves to the right, which forms oil passage between bridge passage (6) and A5 port, and between B5 port and T port.

2. The pressure-fed oil from the P port opens the load check valve (2) and flows to A5 port to extend the boom cylinder.

3. Return oil from the boom cylinder returns to the transmission case through the B5 port, low pressure passage and T port.
2.2.6 Backhoe control valve in L.H. stabilizer shrink position

1. When the right stabilizer control lever is pushed to the forward to set to the shrink position, the spool (4) of the stabilizer L.H. control valve moves to the left, which forms oil passage between bridge passage (6) and B4 port, and between A4 port and T port.

2. The pressure-fed oil from the P port opens the load check valve (2), and flows to B4 port to retract the left stabilizer cylinder.

3. Return oil from the left stabilizer cylinder returns to the transmission case through the A4 port, low pressure passage and T port.
2.2.7 Backhoe control valve in L.H. stabilizer extend position

1. When the right stabilizer control lever is pulled to the downward to set to the extend position, the spool (4) of the stabilizer L.H. control valve moves to the right, which forms oil passage between bridge passage (6) and A4 port, and between B4 port and T port.

2. The pressure-fed oil from the P port opens the load check valve (2), and flows to A4 port to retract the left stabilizer cylinder.

3. Return oil from the left stabilizer cylinder returns to the transmission case through the B4 port, low pressure passage and T port.

![Diagram of backhoe control valve]
2.2.8 Backhoe control valve in R.H. stabilizer shrink position

1. When the right stabilizer control lever is pushed to the forward to set to the shrink position, the spool (4) of the stabilizer R.H. control valve moves to the left, which forms oil passage between bridge passage (6) and B3 port, and between A3 port and T port.

2. The pressure-fed oil from the P port opens the load check valve (2), and flows to B3 port to retract the right stabilizer cylinder.

3. Return oil from the right stabilizer cylinder returns to the transmission case through the A3 port, low pressure passage and T port.
2.2.9 Backhoe control valve in R.H. stabilizer extend position

1. When the right stabilizer control lever is pulled to the downward to set to the extend position, the spool (4) of the stabilizer R.H. control valve moves to the right, which forms oil passage between bridge passage (6) and A3 port, and between B3 port and T port.
2. The pressure-fed oil from the P port opens the load check valve (2), and flows to A3 port to extend the right stabilizer cylinder.
3. Return oil from the right stabilizer cylinder returns to the transmission case through the B3 port, low pressure passage and T port.

![Diagram of backhoe control valve](image)
2.2.10 Backhoe control valve in dipperstick crowd position

1. When the dipperstick and bucket lever is pulled to the backward to set to the crowd position, the spool (4) of the dipperstick control valve moves to the left, which forms oil passage between bridge passage (6) and B2 port, and between A2 port and T port.

2. The pressure-fed oil from the P port opens the load check valve (2) and flows to B2 port to extend the dipperstick cylinder.

3. Return oil from the dipperstick cylinder returns to the transmission case through the A2 port, low pressure passage and T port.
2.2.11 Backhoe control valve in dipperstick extend position

1. When the dipperstick and bucket lever is pushed to the forward to set to the extend position, the spool (4) of the dipperstick control valve moves to the right, which forms oil passage between bridge passage (6) and A2 port, and between B2 port and T port.

2. The pressure-fed oil from the P port opens the load check valve (2) and flows to A2 port to retract the dipperstick cylinder.

3. Return oil from the dipperstick cylinder returns to the transmission case through the B2 port, low pressure passage and T port.
2.2.12 Backhoe control valve in bucket roll-back position

1. When the dipperstick and bucket lever is moved to the left to set to the roll-back position, the spool (4) of the bucket control valve moves to the right, which forms oil passage between bridge passage (6) and B1 port, and between A1 port and T port.
2. The pressure-fed oil from the P port opens the load check valve (2) and flows to B1 port to extend the bucket cylinder (7).
3. Return oil from the bucket cylinder (7) returns to the transmission case through the A1 port, low pressure passage and T port.
2.2.13 Backhoe control valve in bucket dump position

1. When the dipperstick and bucket lever is moved to the right to set to the dump position, the spool (4) of the bucket control valve moves to the left, which forms oil passage between bridge passage (6) and A1 port, and between B1 port and T port.

2. The pressure-fed oil from the P port opens the load check valve (2) and flows to A1 port to retract the bucket cylinder.

3. Return oil from the bucket cylinder returns to the transmission case through the B1 port, low pressure passage and T port.

T: Tank port
P.B.: Power beyond port

P: Low pressure
B: High pressure

2.3 Structure of overload relief valve

Overload relief valve in this control valve is a combination valve combining a relief operation and anti-cavitation operation.

**Relief operation**

When the control valve is in the neutral position, both cylinder ports of control valve are blocked by the spool. If an external load is imposed on the cylinder, pressure builds in the circuit.

When the pressure exceeds the set level of the overload relief valve, the relief valve opens and the oil returns to tank. In this way, the hydraulic circuit and actuator are protected from excessive pressures.

**Anti-cavitation operation**

Overload relief valve also has anti-void function. If a negative pressure takes place in the circuit, the oil is fed from the tank to eliminate the negative pressure.

![Diagram of overload relief valve](image1)

**2.3.1 Function of relief position**

When the actuator port pressure is lower than the setting

The cylinder port HP is applied to the seat B in the following route: first through the check valve poppet (1) of side, second through the chamber A, and then through the valve poppet (2). This cylinder port HP works to open the pilot poppet (3). Because the piston spring (4) has not reached the set pressure, however, the valve stays shut.

![Diagram of relief position](image2)
When the actuator port pressure is higher than the setting
When the cylinder port HP has reached the set pressure of the piston spring (4), the pressure oil in the chamber A opens the pilot poppet (3) and flows through the drain passage into the tank passage. The pressure oil flows then from this seat into the tank, and the circuit pressure is kept at the pressure level set by the overload relief valve.

</tbody>
</table>

- Oil temperature: 45 to 55 °C (113 to 131 °F)

2.3.2 Function of anti-cavitation position
This valve, in operation, prevents a condition – so called cavitation – that arises in the cylinder port HP where fluid is not entirely filling out. That is, this relief valve is combined an anti-cavitation functions supplying oil. The pressure oil at the tank port L.H. opens the check valve poppet (1), allowing oil to flow through the tank port L.H. to prevent negative pressure from being generated in the cylinder.
3. Structure of hydraulic cylinder

The bucket, dipperstick, boom, swing, and stabilizer cylinders consist of a cylinder head (2), piston rod (1), cylinder tube (3), piston (4) and other parts. They are single-rod double acting cylinders in which the reciprocating motion of the piston is controlled by hydraulic force applied to both of its ends.

5. Disassembling and assembling

5.1 Removing backhoe

5.1.1 Preparing to remove backhoe

**CAUTION**
- Before starting the engine, always sit in the operator's seat of the tractor.
- Before getting off the tractor, make sure that the PTO lever is off and the range gear shift lever is in the neutral position. Then set the parking brake.
• Keep hands, feet, and body from between the tractor and the backhoe. Never allow any part of body under the machine.
• Before leaving the operator’s seat of the backhoe, fully lower the boom to the ground.
• Before removing the backhoe, set the swing lock pin.

**IMPORTANT**
• Before removing the backhoe, set the engine speed as follows.

<table>
<thead>
<tr>
<th>Engine speed</th>
<th>Factory specification</th>
<th>Approximately 1800 rpm</th>
</tr>
</thead>
</table>

• For removing the backhoe, locate the tractor, the loader, and the backhoe on a flat level and hard surface, preferably concrete. If the surface is soft, place a board on the ground for the bucket and stabilizers.

1. Set the swing lock pin (1) to prevent the pivoting of the boom before removing the backhoe.

![Swing lock pin](image1)

(1) Swing lock pin

2. Stand beside the rear tire, fully close the dipperstick, curl the bucket and lower the boom until the back of bucket contacts the ground.

3. Keep the stabilizer pads at height (A) of the following value.

![Height of stabilizer pads](image2)

(A) Height of stabilizer pads

5.1.2 Releasing mounting pins

1. Lower the boom, and raise the rear wheels slightly off the ground.

While the mounting levers are pulled, the mounting pins of the main frame may turn in both directions. When the mounting pins come to the **release** position, push the levers in the holding hole to release the mounting pins.

![Mounting lever](image3)

(1) Mounting lever

2. Slowly raise the boom to disengage the backhoe from the tractor.

![Disengage backhoe](image4)

![Release mounting pins](image5)
3. Raise the backhoe by operating the stabilizers to the lowering direction until the mount bars hit to the guide stopper on the support hooks.

4. Move the tractor forward from the backhoe to the following value.

| Distance between tractor and backhoe | Factory specification | About 203 mm (8.0 in.) |

**IMPORTANT**
- Be careful not to damage or break the hoses when moving the tractor.

5. Lower the main frame and the swing frame onto the ground by operating the boom and the stabilizer control levers.

6. Stop the engine and set the parking brake.

5.1.3 Disconnecting hydraulic hoses
1. Slowly release all hydraulic pressure by moving the hydraulic control levers of the backhoe in all directions.
2. Disconnect the hydraulic hoses in the following manner.

a. Disconnect the inlet hose, the outlet hose, and the power beyond hose from the tractor.
b. Connect the outlet hose of the tractor to the coupler of the power beyond pipe.

3. Cap the couplers on the backhoe.

5.1.4 Removing backhoe
1. Start the engine and drive the tractor and loader slowly away from the backhoe.
2. Stop the engine and remove the key from the tractor. Set the parking brake.

**IMPORTANT**
- The entire 3-point hitch can now be reinstalled on the tractor for use with other rear mount implements.
- Be sure that there is sufficient ballast in the rear tires and an implement is attached to the 3-point hitch before using the loader with the backhoe removed.

5.2 Installing backhoe
5.2.1 Preparing to install backhoe

**WARNING**
To avoid personal injury or death:
- When starting the engine, always sit in the operator’s seat.
- When getting off the tractor, make sure that the PTO lever is off and the range gear shift lever is in the neutral position. Set the parking brake.
- Keep hands, feet, and body from between the tractor and the backhoe. Never allow any part of body under the machine.

**CAUTION**
To avoid personal injury:
• Make sure that the PTO of the tractor is disengaged.

**IMPORTANT**
• Before reinstalling the backhoe, set the engine speed to low-idle.

1. Remove the 3-point hitch and / or drawbar (if equipped).
2. Disconnect the mower if attached in position.
3. Make sure that the swing lock pin is installed.
4. Slowly back the tractor and the loader, centering to the main frame of the backhoe.
5. Stop the tractor keeping at the following distance from the backhoe.

<table>
<thead>
<tr>
<th>Distance between tractor and backhoe</th>
<th>Factory specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>254 to 304 mm (10.0 to 12.0 in.)</td>
<td>(1) Mounting lever</td>
</tr>
</tbody>
</table>

6. Stop the engine and set the parking brake.

5.2.2 Connecting hydraulic hoses
1. Connect the inlet hose, outlet hose, and the power beyond hose of the backhoe to the outlet hose, the power beyond pipe and the return pipe of the tractor.

![Diagram](image)

(1) Inlet hose (Backhoe) (2) Outlet hose (Backhoe) (3) Power beyond hose (Backhoe) (4) Outlet hose (Tractor) (5) Return pipe (Tractor) (6) Power beyond pipe (Tractor)

**IMPORTANT**
• Make sure that both hoses are firmly connected before starting the engine.

5.2.3 Setting mounting pins
1. Pull the mounting levers for left and right mounting pins of the main frame of the backhoe to release mounting pins.

![Diagram](image)

(1) Mount bar (2) Support hook

**NOTE**
• If the support hooks are not parallel to the mount bars, adjust them with the stabilizers.
3. Move the tractor backward until the support hooks on the main frame of the tractor are just beneath the mount bars on the main frame of the backhoe.

![Diagram of tractor and backhoe mountings](image1)

- (1) Mount bar
- (2) Support hook
- (3) Guide stop

4. Lower the mount bars onto the support hooks by operating the stabilizer and the boom control levers.

5. Lower the boom slowly and interlock the mounting pins with the support hooks.

![Diagram of mounting pins and support hooks](image2)

- (4) Mounting pin
- (5) Support hooks

6. Continue to slowly lower the boom so that the rear wheels are slightly off the ground.

**WARNING**

To avoid personal injury or death:
- Make sure that the left and right mounting pins are in holding position.
- When mounting, check the gap between the mounting bar and the link. If there is a gap, push the link in.

The lock pins will click.

7. Operate the boom or the stabilizers to maximum lift height, and insert the lock pin of the boom.

**IMPORTANT**

- If the slide bar of the mounting pins is inserted to the upper hole, the mounting pin comes off and the backhoe might come off. Therefore, please make sure to insert the slide bar to the lower hole.

**NOTE**

- Move the tractor, the loader, the backhoe to a vacant area and cycle all backhoe functions. Cycling all backhoe functions will check their operation and flow oil back through the system, filtering it, and refilling each circuit. Check the hydraulic oil level before putting the backhoe into full operation.

5.3 Disassembling backhoe

**IMPORTANT**

- When reassembling the pins, bushings and inner rings, apply slight coat of grease to them.
- When tightening the hydraulic hoses, tighten to specified torque.

--- RELATED PAGE ---

TIGHTENING TORQUES on page 2-13
5.3.1 Removing bucket

1. Remove the bucket (3) from the dipper stick (4).

2. Disconnect the hydraulic hoses (2) and remove the bucket cylinder (4).

3. Remove the pins (1), (10) and remove the dipperstick (8).

**NOTE**
- To prevent from the damage of hydraulic hoses, set the wooden block etc. between dipperstick cylinder and boom.

*(When reassembling)*
- Lock the locking nuts to setting bolts at position where the setting bolt may still be rotated.
- Replace the spacers (9) at their original position.

5.3.2 Removing dipperstick and bucket cylinder

1. Remove the pins (6) and remove the bucket link (7) and guide link (5).

2. Disconnect the hydraulic hoses (2) and remove the bucket cylinder (4).

3. Remove the pins (1), (10) and remove the dipperstick (8).

**NOTE**
- To prevent from the damage of hydraulic hoses, set the wooden block etc. between dipperstick cylinder and boom.

*(When reassembling)*
- Lock the locking nuts to setting bolts at position where the setting bolt may still be rotated.
- Replace the spacers (9) at their original position.
5.3.3 Removing dipperstick cylinder, boom, boom cylinder, and hoses

1. Disconnect the hydraulic hoses and remove the dipperstick cylinder (4).
2. Remove the pins (1), (3) and remove the boom cylinder (2).
3. Remove the pin (6) and remove the boom (5).
4. Remove the hydraulic hoses from the control valve.

(When reassembling)

**NOTE**
- Hoses should not touch the swing frame.
- Hoses should not be twisted.
- Lock the locking nuts to setting bolts at position where the mounting bolt may still be rotated.
- Connect the hydraulic hoses at their original positions and be sure to connect the hose angle as indicated table below.
### Port Angle of bent tube

<table>
<thead>
<tr>
<th>Port</th>

</table>

### 5.3.4 Removing swing frame

1. Disconnect the swing cylinder rods (5) from swing frame (4).
2. Remove the swing frame (4) from main frame (1).

### 5.3.5 Removing swing cylinder

1. Remove the swing cylinder bottom pin (3).
2. Disconnect the hydraulic hoses (1).
3. Remove the swing cylinder (2).

### 5.3.6 Removing stabilizers and stabilizer cylinder

1. Remove the pins (1) (4) and remove the stabilizer cylinder (2) with hydraulic hoses.
2. Remove the pin (5) and remove the stabilizer (6).

#### When reassembling

- Lock the locking nuts to setting bolts at position where the setting bolt may still be rotated.
- Reinstall the thrust washers (6) at their original positions.
5.3.7 Removing lever support and control valve

1. Remove the valve covers (1), (2).
2. Disconnect the control lever rods (3) of valve side.
3. Remove the lever support (4) with control levers.
4. Disconnect the hydraulic hoses.
5. Remove the control valve (15).

(When reassembling)

**NOTE**
- P port is short hose without sleeve.
- T port is long hose with sleeve.
- Connect the hydraulic hoses at their original portions and be sure to connect the hose angle as indicated table below.

<table>
<thead>
<tr>
<th>Port</th>
<th>Angle of bent tube</th>
</tr>
</thead>
<tbody>
<tr>
<td>T</td>
<td>L: 1.57 rad (90°)</td>

<tr>
<td>A2, B2</td>
<td>R: 0.17 rad (10°)</td>
</tr>
<tr>
<td>A5, B5</td>
<td>L: 0.35 rad (20°)</td>
</tr>
</tbody>
</table>
5.3.8 Removing backhoe main frame

1. Lift the backhoe main frame (1) and release the mounting pins (2).
2. Disconnect the three hydraulic hoses from the tractor.
3. Separate the main frame from the tractor frame.

5.4 Disassembling control valve

1. Remove the spring and load check valve.
2. Remove the seal plate from valve housing.
3. Remove the cap and draw out the spool from the valve housing.

(When reassembling)
- Clean all parts with a suitable solvent, and dry with a lint-free cloth or air.
- Visually inspect all parts for signs of scoring or damage.
- Install the spool and seal plate to the valve housing, being careful not to damage the O-rings.

5.5 Disassembling cylinder (Boom, dipperstick, bucket, swing, stabilizer)

5.5.1 Removing cylinder rod assembly

1. Drain hydraulic oil from the cylinder, and secure the tube end of the cylinder in a vise.
2. Remove the cylinder head (1) with the adjustable gland nut wrench (4).
3. Pull out the piston rod assembly (2) from the cylinder tube (3).

(When reassembling)
- Visually inspect the cylinder tube for signs of scoring or damage.
- Insert the piston rod assembly to the cylinder tube, being careful not to damage the piston seal on the piston.
• Install the cylinder head to the cylinder tube, being careful not to damage the O-ring on the cylinder head.

**Tightening torque**

<table>
<thead>
<tr>
<th>Component</th>
<th>Torque Range</th>

<tr>
<td></td>
<td>222 to 258 lbf·ft</td>
</tr>
</tbody>
</table>

5.5.2 Removing cylinder head, piston, and nut

1. Secure the rod end in a vise.
2. Remove the nut (4), the piston (3) and cylinder head (2) from the piston rod (1).

(When reassembling)

• Visually inspect all parts for signs of scoring or damage.

5.5.3 Checking cylinder adaptor angle

• Connect the cylinder adaptor at their original positions and be sure to connect the adaptor angle as indicated table below.

<table>
<thead>
<tr>
<th>Cylinder</th>
<th>Rod side</th>

5.5.4 Removing piston seal and O-ring

1. Remove the piston seal (2) and O-ring (3) from the piston (1).

![Diagram](3UFAAABL.P048A)

(1) Piston  
(2) Piston seal  
(3) O-ring

**IMPORTANT**
- To install the O-ring (3) and piston seal (2) to the piston (1), use the slide jig and correcting jig as shown in special tools of GENERAL section.

5.5.5 Installing O-ring and piston seal

1. Set the slide jig (2) on the piston (4).
2. Install the O-ring (3) to the piston using the slide jig.
3. Install the piston seal (1) over the O-ring using the slide jig.

**NOTE**
- Do not turn (roll) the piston seal as you install it.

![Diagram](3UFAAABL.P039A)

(1) Piston seal  
(2) Slide jig  
(3) O-ring  
(4) Piston

4. Compress the piston seal to the correct size by installing the piston into the correcting jig (5).
6. Servicing

6.1 Checking clearance between pin and bushing

1. Measure the pins O.D. with an outside micrometer.
2. Measure the bushings I.D. with a cylinder gauge.
3. If the clearance exceeds the allowable limit, replace pin or bushing.

<table>
<thead>
<tr>
<th>Clearance</th>
<th>Factory specification</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Boom cylinder rod pin and cylinder bushing</td>
<td>0.060 to 0.185 mm, 0.002 to 0.007 in.</td>
<td>1.0 mm, 0.0394 in.</td>
</tr>
<tr>
<td>(2) Dipperstick fulcrum pin and bushing</td>
<td>0.140 to 0.180 mm, 0.006 to 0.007 in.</td>
<td>1.0 mm, 0.0394 in.</td>
</tr>
<tr>
<td>(3) Dipperstick cylinder rod pin and cylinder bushing</td>
<td>0.060 to 0.185 mm, 0.002 to 0.007 in.</td>
<td>1.0 mm, 0.0394 in.</td>
</tr>
<tr>
<td>(4) Bucket cylinder rod pin / guide link pin / bucket fulcrum pin / bucket link pin and bushing</td>
<td>0.204 to 0.315 mm, 0.008 to 0.012 in.</td>
<td>1.0 mm, 0.0394 in.</td>
</tr>
<tr>
<td>(5) Boom support pin and bushing</td>
<td>0.140 to 0.180 mm, 0.006 to 0.007 in.</td>
<td>1.0 mm, 0.0394 in.</td>
</tr>
<tr>
<td>(6) Main frame fulcrum pin and bushing</td>
<td>0.070 to 0.130 mm, 0.003 to 0.005 in.</td>
<td>0.5 mm, 0.0197 in.</td>
</tr>
<tr>
<td>(7) Swing cylinder rod pin and cylinder bushing</td>
<td>0.108 to 0.259 mm, 0.004 to 0.010 in.</td>
<td>1.0 mm, 0.0394 in.</td>
</tr>
</tbody>
</table>
6.2 Checking thrust washer wear

**NOTE**
- Visually inspect the thrust washer for signs of scoring or damage not only on the thrust washer but also on the main frame and swing frame contact surface.

1. Measure the thickness of thrust washer with an outside micrometer.
2. If the wear exceeds the allowable limit, replace it.

<table>
<thead>
<tr>
<th>Thrust washer thickness</th>
<th>Factory specification</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2.66 mm</td>
<td>1.8 mm</td>
</tr>
<tr>
<td></td>
<td>0.1046 in.</td>
<td>0.0709 in.</td>
</tr>
</tbody>
</table>

6.3 Checking piston rod bend

1. Set the piston rod on V blocks.
2. Set a dial indicator on the center of the rod.
3. Turn the piston rod and read the dial indicator.
4. If the measurement is more than the allowable limit, replace it.

<table>
<thead>
<tr>
<th>Piston rod bend</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.25 mm</td>
</tr>
<tr>
<td></td>
