TO THE READER

This Workshop Manual has been prepared to provide servicing personnel with information on the mechanism, service and maintenance of KUBOTA Tractor B1830, B2230, B2530 and B3030. It is divided into three parts, “General”, “Mechanism” and “Servicing” for each section.

■ General
Information on the tractor identification, the general precautions, maintenance check list, check and maintenance and special tools are described.

■ Mechanism
Information on the construction and function are included. This part should be understood before proceeding with troubleshooting, disassembling and servicing.
Refer to Diesel Engine / Tractor Mechanism Workshop Manual (Code No. 9Y021-01874 / 9Y021-18201) for the one which has not been described to this workshop manual.

■ Servicing
Information on the troubleshooting, servicing specification lists, tightening torque, checking and adjusting, disassembling and assembling and servicing which cover procedures, precautions, factory specifications and allowable limits.

All information illustrations and specifications contained in this manual are based on the latest product information available at the time of publication.
The right is reserved to make changes in all information at any time without notice.

SAFETY FIRST

This symbol, the industry’s “Safety Alert Symbol”, is used throughout this manual and on labels on the machine itself to warn of the possibility of personal injury. Read these instructions carefully. It is essential that you read the instructions and safety regulations before you attempt to repair or use this unit.

DANGER : Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.

WARNING : Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION : Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury.

IMPORTANT : Indicates that equipment or property damage could result if instructions are not followed.

NOTE : Gives helpful information.

BEFORE SERVICING AND REPAIRING

- Read all instructions and safety instructions in this manual and on your machine safety decals.
- Clean the work area and machine.
- Park the machine on a firm and level ground, and set the parking brake.
- Lower the implement to the ground.
- Stop the engine, and remove the key.
- Disconnect the battery negative cable.
- Hang a “DO NOT OPERATE” tag in operator station.
SAFETY INSTRUCTIONS

SAFETY STARTING
- Do not start the engine by shorting across starter terminals or bypassing the safety start switch.
- Do not alter or remove any part of machine safety system.
- Before starting the engine, make sure that all shift levers are in neutral positions or in disengaged positions.
- Never start the engine while standing on ground. Start the engine only from operator’s seat.

SAFETY WORKING
- Do not work on the machine while under the influence of alcohol, medication, or other substances or while fatigued.
- Wear close fitting clothing and safety equipment appropriate to the job.
- Use tools appropriate to the work. Makeshift tools, parts, and procedures are not recommended.
- When servicing is performed together by two or more persons, take care to perform all work safely.
- Do not work under the machine that is supported solely by a jack. Always support the machine by safety stands.
- Do not touch the rotating or hot parts while the engine is running.
- Never remove the radiator cap while the engine is running, or immediately after stopping. Otherwise, hot water will spout out from radiator. Only remove radiator cap when cool enough to touch with bare hands. Slowly loosen the cap to first stop to relieve pressure before removing completely.
- Escaping fluid (fuel or hydraulic oil) under pressure can penetrate the skin causing serious injury. Relieve pressure before disconnecting hydraulic or fuel lines. Tighten all connections before applying pressure.

AVOID FIRES
- Fuel is extremely flammable and explosive under certain conditions. Do not smoke or allow flames or sparks in your working area.
- To avoid sparks from an accidental short circuit, always disconnect the battery negative cable first and connect it last.
- Battery gas can explode. Keep sparks and open flame away from the top of battery, especially when charging the battery.
- Make sure that no fuel has been spilled on the engine.
VENTILATE WORK AREA
• If the engine must be running to do some work, make sure the area is well ventilated. Never run the engine in a closed area. The exhaust gas contains poisonous carbon monoxide.

PREVENT ACID BURNS
• Sulfuric acid in battery electrolyte is poisonous. It is strong enough to burn skin, clothing and cause blindness if splashed into eyes. Keep electrolyte away from eyes, hands and clothing. If you spill electrolyte on yourself, flush with water, and get medical attention immediately.

DISPOSE OF FLUIDS PROPERLY
• Do not pour fluids into the ground, down a drain, or into a stream, pond, or lake. Observe relevant environmental protection regulations when disposing of oil, fuel, coolant, electrolyte and other harmful waste.

PREPARE FOR EMERGENCIES
• Keep a first aid kit and fire extinguisher handy at all times.
• Keep emergency numbers for doctors, ambulance service, hospital and fire department near your telephone.
SAFETY DECALS

The following safety decals are installed on the machine.
If a decal becomes damaged, illegible or is not on the machine, replace it. The decal part number is listed in the parts list.

■ ROPS and CABIN

(1) Part No. 6C070-4742-2

**CAUTION**

TO AVOID PERSONAL INJURY:
1. Read and understand the operator’s manual before operation.
2. Before starting the engine, make sure that everyone is at a safe distance from the tractor and that the PTO is OFF.
3. Do not allow passengers on the tractor at any time.
4. Before allowing other people to use the tractor, have them read the operator’s manual.
5. Check the tightness of all nuts and bolts regularly.
6. Keep all shields in place and stay away from all moving parts.
7. Lock the two brake pedals together before driving on the road.
8. Slow down for turns, or rough roads, or when applying individual brakes.
9. On public roads use SMV emblem and hazard lights, if required by local traffic and safety regulations.
10. Pull only from the drawbar.
11. Before dismounting, lower the implement to the ground, set the parking brake, stop the engine and remove the key.
12. Securely support tractor and implements before working underneath.

(2) Part No. 6C150-4743-1

**WARNING**

BEFORE DismountING TRACTOR:
1. ALWAYS SET PARKING BRAKE.
   Leaving transmission in gear with the engine stopped will not prevent tractor from rolling.
2. PARK ON LEVEL GROUND WHENEVER POSSIBLE.
   If parking on a slope, position tractor across the slope.
3. LOWER ALL IMPLEMENTS TO THE GROUND.
4. STOP THE ENGINE.

3TBAAJCP001A
1. Kubota recommends the use of a Roll-Over Protective Structures (ROPS) and seat belt in almost all applications.
2. Remove the ROPS only when it substantially interferes with operation or itself presents a safety risk. (Examples include work in orchards and vineyards.) ALWAYS REINSTALL IT BEFORE USING THE TRACTOR IN OTHER APPLICATIONS.
3. Never use just the seat belt or just the ROPS. They must be used together. For further details, consult your Operator’s Manual or your local dealer.

(1) Part No. TA040-4932-2 [Rigid ROPS type]

(2) Part No. 32751-4958-1
Stay clear of engine fan and fan belt

(3) Part No. 6C040-5559-1

DANGER EXPLOSIVE GASES
Cigarettes, flames or sparks could cause battery to explode. Always shield and face from battery. Do not charge or use booster cables or adjust post connections without proper instruction and training.

POISON CAUSES SEVERE BURNS
Contains sulfuric acid. Avoid contact with skin, eyes or clothing. In event of accident flush with water and call a physician immediately. KEEP OUT OF REACH OF CHILDREN
SAFETY INSTRUCTIONS

(1) Part No. 6C090-4965-1

⚠️ DANGER

TO AVOID POSSIBLE INJURY OR DEATH FROM A MACHINE RUNAWAY.
1. Do not start engine by shorting across starter terminals or bypassing the safety start switch. Machine may start in gear and move if normal starting circuitry is bypassed.
2. Start engine only from operator's seat with transmission and PTO OFF. Never start engine while standing on the ground.

(2) Part No. TA040-4959-3

⚠️ WARNING

TO AVOID PERSONAL INJURY.
1. Keep PTO shield in place at all times.
2. Do not operate the PTO at speeds faster than the speed recommended by the implement manufacturer.
3. For trailing PTO-driven implements, set drawbar at towing position. (see operator's manual)

(3) Part No. 6C040-4741-2

No fire

(4) Part No. 6C140-4744-1

⚠️ WARNING

TO AVOID PERSONAL INJURY:
1. Attach pulled or towed loads to the drawbar only.
2. Use the 3-point hitch only with equipment designed for 3-point hitch usage.

(5) Part No. TA040-4958-1

Do not touch hot surface like muffler, etc.
(1) Part No. 3A111-6554-1

**WARNING**

Never modify or repair a ROPS because welding, grinding, drilling or cutting any portion may weaken the structure.

**CAUTION**

**TO AVOID INJURY WHEN RAISING OR FOLDING ROPS:**
- Set parking brake and stop engine.
- Remove any obstruction that may prevent raising or folding of the ROPS.
- Do not allow any bystanders.
- Always perform function from a stable position at the rear of the tractor.
- Hold the top of the ROPS securely when raising or folding.
- Make sure all pins are installed and locked.

(2) Part No. 6C200-4751-1

**CAUTION**

**TO AVOID PERSONAL INJURY:**
**BEFORE STARTING THE ENGINE**
1. Make sure the parking brake is set.
2. Make sure the range gear shift lever (L-M-H) is in "NEUTRAL" position.
3. Make sure the cruise control lever is in "NEUTRAL" position (Far back position).

**CARE OF DANGER, WARNING AND CAUTION LABELS**

1. Keep danger, warning and caution labels clean and free from obstructing material.
2. Clean danger, warning and caution labels with soap and water, dry with a soft cloth.
3. Replace damaged or missing danger, warning and caution labels with new labels.
4. If a component with danger, warning or caution label(s) affixed is replaced with new part, make sure new label(s) is (are) attached in the same location(s) as the replaced component.
5. Mount new danger, warning and caution labels by applying on a clean dry surface and pressing any bubbles to outside edge.
CABIN
Careful operation is your best insurance against an accident. **Read and understand carefully this section of the separately issued operator’s manual before operating the tractor.**

(1) Part No. TA040-4902-1

(2) Part No. 6C230-4743-1

BEFORE DISMOUNTING TRACTOR:
1. ALWAYS SET PARKING BRAKE. Leaving transmission in gear with the engine stopped will not prevent tractor from rolling.
2. PARK ON LEVEL GROUND WHenever POSSIBLE. If parking on a slope, position tractor across the slope.
3. LOWER ALL IMPLEMENTS TO THE GROUND.
4. STOP THE ENGINE.

CARE OF DANGER, WARNING AND CAUTION LABELS
1. Keep danger, warning and caution labels clean and free from obstructing material.
2. Clean danger, warning and caution labels with soap and water, dry with a soft cloth.
3. Replace damaged or missing danger, warning and caution labels with new labels.
4. If a component with danger, warning or caution label(s) affixed is replaced with new part, make sure new label(s) is (are) attached in the same location(s) as the replaced component.
5. Mount new danger, warning and caution labels by applying on a clean dry surface and pressing any bubbles to outside edge.

### Engine

- **Number of cylinders**: 3, 4
- **Bore and stroke**: 76 × 73.6 mm (3.0 × 2.9 in.), 78 × 78.4 mm (3.1 × 3.1 in.), 78 × 78.4 mm (3.1 × 3.1 in.)
- **Total displacement**: 1001 cm³ (61.1 cu.in.), 1123 cm³ (68.5 cu.in.), 1498 cm³ (91.4 cu.in.)
- **Engine gross power**: 16.2 kW (22.0 PS)*, 18.4 kW (25.0 PS)*, 22.1 kW (30.0 PS)*
- **Rated revolution**: 2700 min⁻¹ (rpm), 2600 min⁻¹ (rpm)
- **Maximum torque**: 62 N·m (6.3 kgf·m, 13.9 lbf·ft), 72 N·m (7.3 kgf·m, 16.2 lbf·ft), 92 N·m (9.4 kgf·m, 20.7 lbf·ft)
- **Battery**: 12 V, RC : 79 min, CCA : 433 A
- **Starting system**: Electric starting with cell starter 12 V, 1.4 kW
- **Lubricating system**: Forced lubrication by trochoidal pump
- **Cooling system**: Pressurized radiator, forced circulation with water pump
- **Fuel**: Diesel fuel No. 2-D [above –10 °C (14 °F)], Diesel fuel No. 1 [below –10 °C (14 °F)]

### Capacities

- **Fuel tank**: 28 L (7.4 U.S.gals, 6.2 Imp.gals), 31 L (8.1 U.S.gals, 6.8 Imp.gals)
- **Engine crankcase (with filter)**: 3.0 L (3.2 U.S.qts, 2.6 Imp.qts), 4.1 L (4.3 U.S.qts, 3.6 Imp.qts)
- **Engine coolant**: 5.2 L (5.5 U.S.qts, 4.6 Imp.qts)
- **Transmission case**: 17 L (4.5 U.S.gals, 3.7 Imp.qts)
- **Front axle case**: 3.7 L (3.9 U.S.qts, 3.3 Imp.qts), 4.7 L (5.0 U.S.qts, 4.1 Imp.qts)

### Tire

</tbody>
</table>

### Dimensions

- **Overall length (with 3P)**: ROPS 2735 mm (107.7 in.), CABIN 2835 mm (111.6 in.), 2900 mm (114.2 in.), 3010 mm (118.6 in.)
- **Overall width (min. tread)**: 1105 mm (43.5 in.), 1095 mm (43.1 in.), 1365 mm (53.7 in.)
- **Overall height**: ROPS 2260 mm (89.0 in.), 2290 mm (90.2 in.), 2320 mm (91.3 in.), 2125 mm (83.7 in.)
- **Wheel base**: 1500 mm (59.1 in.), 1666 mm (65.6 in.)
- **Minimum ground clearance**: 240 mm (9.5 in.), 270 mm (10.6 in.), 315 mm (12.4 in.)
- **Tread**: Front 855 to 1075 mm (33.7 to 42.3 in.), 850 to 1095 mm (33.5 to 43.1 in.), 1050 mm (41.3 in.), Rear 835 mm (32.9 in.), 935 mm (36.8 in.)
- **Weight**: ROPS 745 kg (1643 lbs), 750 kg (1654 lbs), 840 kg (1852 lbs), CABIN 955 kg (2106 lbs), 960 kg (2117 lbs), 1035 kg (2282 lbs)

### Travelling system

- **Clutch**: N/A
- **Steering**: Hydrostatic power steering
- **Transmission**: Main-hydrostatic transmission, 3 range gear shift (3 forward and 3 reverse)
- **Brake**: Wet disk type
- **Min. turning radius (with brake)**: 2.1 m (6.9 feet)
- **Differential**: Bevel gear

1. TRACTOR IDENTIFICATION

When contacting your local KUBOTA distributor, always specify engine serial number, tractor serial number and hour meter reading.

(1) Tractor Identification Plate
(2) Tractor Serial Number
(3) Engine Serial Number
(4) CABIN Identification Plate
   (CABIN Serial Number)

[A] ROPS
[B] CABIN

KiSC issued 03, 2007 A
2. GENERAL PRECAUTIONS

- During disassembly, carefully arrange removed parts in a clean area to prevent confusion later. Screws, bolts and nuts should be installed in their original position to prevent reassembly errors.
- When special tools are required, use KUBOTA genuine special tools. Special tools which are not frequently used should be made according to the drawings provided.
- Before disassembling or servicing electrical wires, always disconnect the ground cable from the battery first.
- Remove oil and dirt from parts before measuring.
- Use only KUBOTA genuine parts for parts replacement to maintain machine performance and to assure safety.
- Gaskets and O-rings must be replaced during reassembly. Apply grease to new O-rings or oil seals before assembling. See the figure left side.
- When reassembling external snap rings or internal snap rings, they must be positioned so that sharp edge faces against the direction from which a force is applied. See the figure left side.
- When inserting spring pins, their splits must face the direction from which a force is applied. See the figure left side.
- To prevent damage to the hydraulic system, use only specified fluid or equivalent.

(1) Grease  
(2) Force  
(3) Sharp Edge  
(4) Axial Force  
(5) Rotating Movement

(A) External Snap Ring  
(B) Internal Snap Ring

3TMABAB0P005A
3. HANDLING PRECAUTIONS FOR ELECTRICAL PARTS AND WIRING

To ensure safety and prevent damage to the machine and surrounding equipment, heed the following precautions in handling electrical parts and wiring.

**IMPORTANT**
- Check electrical wiring for damage and loosened connection every year. To this end, educate the customer to do his or her own check and at the same time recommend the dealer to perform periodic check for a fee.
- Do not attempt to modify or remodel any electrical parts and wiring.
- When removing the battery cables, disconnect the negative cable first. When installing the battery cables, connect the positive cable first.

(1) Negative Terminal          (2) Positive Terminal

[1] WIRING

- Securely tighten wiring terminals.

(1) Correct          (2) Incorrect
(Securely Tighten)   (Loosening Leads to Faulty Contact)

- Do not let wiring contact dangerous part.

(1) Dangerous Part          (3) Wiring (Correct)
(2) Wiring (Incorrect)      (4) Dangerous Part

- Securely insert grommet.

(1) Grommet          (A) Correct
(A) Correct          (B) Incorrect

KiSC issued 03, 2007 A
• Securely clamp, being careful not to damage wiring.
  (1) Clamp
  • Wind Clamp Spirally
  (2) Wire Harness
  (3) Clamp
  (4) Welding Dent
  W10114580

• Clamp wiring so that there is no twist, unnecessary sag, or excessive tension, except for movable part, where sag be required.
  (1) Wiring
  (2) Clamp
  (A) Correct
  (B) Incorrect
  W10115870

• In installing a part, take care not to get wiring caught by it.
  (1) Wiring
  (A) Incorrect
  W10116700

• After installing wiring, check protection of terminals and clamped condition of wiring, only connect battery.
  (1) Cover
  • Securely Install Cover
  W10117350
[2] BATTERY

- Take care not to confuse positive and negative terminal posts.
- When removing battery cables, disconnect negative cable first. When installing battery cables, check for polarity and connect positive cable first.
- Do not install any battery with capacity other than is specified (Ah).
- After connecting cables to battery terminal posts, apply high temperature grease to them and securely install terminal covers on them.
- Do not allow dirt and dust to collect on battery.

**CAUTION**

- Take care not to let battery liquid spill on your skin and clothes. If contaminated, wash it off with water immediately.
- Before recharging the battery, remove it from the machine.
- Before recharging, remove cell caps.
- Do recharging in a well-ventilated place where there is no open flame nearby, as hydrogen gas and oxygen are formed.

[3] FUSE

- Use fuses with specified capacity. Neither too large or small capacity fuse is acceptable.
- Never use steel or copper wire in place of fuse.
- Do not install working light, radio set, etc. on machine which is not provided with reserve power supply.
- Do not install accessories if fuse capacity of reserve power supply is exceeded.

(1) Fuse  (2) Slow Blow Fuse

[4] CONNECTOR

- For connector with lock, push lock to separate.

(A) Push

- In separating connectors, do not pull wire harnesses.
- Hold connector bodies to separate.

(A) Correct  (B) Incorrect
• Use sandpaper to remove rust from terminals.
• Repair deformed terminal. Make certain there is no terminal being exposed or displaced.

(1) Exposed Terminal  (3) Sandpaper
(2) Deformed Terminal  (4) Rust
W10123460

• Make certain that there is no female connector being too open.

(A) Correct  (B) Incorrect
W10124300

• Make certain plastic cover is large enough to cover whole connector.

(1) Cover  (A) Correct  (B) Incorrect
W10125190

[5] HANDLING OF CIRCUIT TESTER

• Use tester correctly following manual provided with tester.
• Check for polarity and range.

W10126840

### Important

- The jobs indicated by ★ must be done after the first 50 hours of operation.
- *1: Air cleaner should be cleaned more often in dusty conditions than in normal conditions.
- *2: Every year or every 6 times of cleaning.
- *3: Replace only if necessary.
- *4: When the battery is used for less than 100 hours per year, check the battery condition by reading the indication annually.
- The items listed above (@ marked) are registered as emission related critical parts by KUBOTA in the U.S.EPA nonroad emission regulation. As the engine owner, you are responsible for the performance of the required maintenance on the engine according to the above instruction.
- Please see the Warranty Statement in detail.

- ▲: Only CABIN model

7. CHECK AND MAINTENANCE

⚠️ CAUTION
- Be sure to check and service the tractor on a flat place with engine shut off, the parking brake on and chock the wheels.

[1] DAILY CHECK
To prevent trouble from occurring, it is important to know the condition of the tractor. Check the following items before starting.

Checking
- Check areas where previous trouble was experienced.
- Walk around the tractor.
1. Check the tire pressure, and check for wear and damage.
2. Check for oil and water leak.
3. Check the engine oil level.
4. Check the transmission fluid level.
5. Check the coolant level.
6. Check the condition of seat belt and ROPS attaching hardware.
7. Check and clean the radiator screen and grill.
8. Check the screws and nuts of tires are tight.
9. Check the number plate.
10. Care of danger, warning and caution labels.
11. Clean around the exhaust manifold and the muffler of the engine.
- While sitting on the operator's seat
1. Check the HST pedal, brake pedals.
2. Check the parking brake.
3. Check the steering wheel.
- Turning the key switch
1. Check the performance of the easy checker lights.
2. Check the lights, turn signal lights, hazard lights and other light equipment. Clean if necessary.
3. Check the performance of the meters and gauges.
- Starting the engine
1. Check to see that the lights on the easy checker go off.
2. Check the color of the exhaust gas.
3. Check the brakes for proper operation.
Cleaning Air Conditioner Condenser Screen (CABIN)

**CAUTION**
- Be sure to stop the engine before removing the screen.

1. Detach the air conditioner condenser screen (1) and remove all foreign materials.

**IMPORTANT**
- Grill and screen must be clean from debris to prevent engine from overheating and to allow good air intake for air cleaner.

(1) Air Conditioner Condenser Screen
[2] CHECK POINTS OF INITIAL 50 HOURS

Changing Engine Oil

⚠️ CAUTION
- Before changing oil, be sure to stop the engine.
1. Start and warm up the engine for approx. 5 minutes.
2. Place an oil pan underneath the engine.
3. To drain the used oil, remove the drain plug (1) at the bottom of the engine and drain the oil completely.
4. Screw in the drain plug (1).
5. Fill new oil up to upper line on the dipstick (2).

■ IMPORTANT
- When using an oil of different manufacture or viscosity from the previous one, remove all of the old oil.
- Never mix two different types of oil.
- Use the proper SAE Engine Oil according to ambient temperatures.
- Refer to "LUBRICANTS, FUEL AND COOLANT". (See page G-7.)

(A) Oil level is acceptable within this range.

Replacing Engine Oil Filter Cartridge

⚠️ CAUTION
- Be sure to stop the engine before changing oil filter cartridge.
- Allow engine to cool down sufficiently, oil can be hot and can burn.
1. Remove the oil filter cartridge with the filter wrench.
2. Apply a slight coat of oil onto the rubber seal of new filter.
3. To install the new cartridge, screw it in by hand. Over tightening may cause deformation of rubber gasket.
4. After the new cartridge has been replaced, the engine oil normally decrease a little. Thus see that the engine oil does not leak through the seal and be sure to read the oil level on the dipstick. Then, replenish the engine oil up to the specified level.

■ IMPORTANT
- To prevent serious damage to the engine, replacement filter must be highly efficient. Use only a KUBOTA genuine filter or its equivalent.

(1) Engine Oil Filter Cartridge
Replacing Transmission Oil Filter Cartridge

⚠️ CAUTION
- Be sure to stop the engine before changing the oil filters.
- Allow engine to cool down sufficiently, oil can be hot and can burn.
1. Drain the transmission fluid.
2. Remove both oil filter cartridges by using a filter wrench.
3. Apply a slight coat of oil onto the new cartridge gasket.
4. To install the new cartridge, screw it in by hand. Over tightening may cause deformation of rubber gasket.
5. After the new cartridge has been replaced, the transmission fluid level will normally decrease slightly. Make sure that the transmission fluid does not leak through the seal. Check the fluid level.

■ IMPORTANT
- To prevent serious damage to the hydraulic system. Use only a genuine KUBOTA filter or its equivalents.

(1) Hydraulic Oil Filter Cartridge (for HST)  (2) Hydraulic Oil Filter Cartridge

W1014458
Changing Transmission Fluid

**CAUTION**
- Be sure to stop the engine when checking and changing the transmission fluid.
- Allow engine to cool down sufficiently, oil can be hot and can burn.

1. Place an oil pan under the tractor.
2. Remove the drain plugs (3), (4) at the bottom of the transmission case and the rear axles.
3. Drain the transmission fluid.
4. After draining, screw in the drain plug.
5. Fill new oil from filling port after removing the filling plug (2) up to the upper notch on the dipstick (1).
6. After running the engine for a few minutes, stop it and check the oil level again, if low, add oil to the prescribed level.

**IMPORTANT**
- Use only multi-grade transmission oil. Use of other oils may damage the transmission or hydraulic system. Refer to "LUBRICANTS, FUEL AND COOLANT" (See page G-7.)
- Never work the tractor immediately after changing the transmission oil. Keeping the engine at medium speed for a few minutes to prevents damage to the transmission.
- Do not mix different brands oil together.

| Transmission fluid capacity | B1830, B2230, B2530 Manual transmission (without Bi-Speed Turn) | 15 L |
|                            |                                                           | 4.0 U.S.gals |

|                            |                                                           | 4.5 U.S.gals |
|                            |                                                           | 3.7 Imp.gals |

(1) Dipstick
(2) Filling Plug
(3) Drain Plug
(4) Drain Plug (Rear Axle Case)

(A) Oil level is acceptable within this range.
Adjusting Clutch Pedal Free Travel

1. Stop the engine and remove the key.
2. Slightly depress the clutch pedal and measure free travel at the top of pedal stroke.
3. If adjustment is needed, loosen the lock nut (2) and turn the clutch rod (1) to adjust the rod length within acceptable limits.
4. Retighten the lock nut (2).
5. After adjusting, release the clutch pedal and check the clearance (B). If adjustment is needed, adjust the clearance B with the bolt (3).

■ NOTE
- After adjustment, sure the stopper bolt with the lock nut (3).

[3] CHECK POINTS OF EVERY 50 HOURS

Checking Engine Start System (HST Model)

⚠️ CAUTION
- Do not allow anyone near the tractor while testing.
- If the tractor does not pass the test, do not operate the tractor.

■ Preparation before testing.
1. Sit on the operator’s seat.
2. Set the parking brake and stop the engine.
3. Shift the range gear shift lever to “NEUTRAL” position.
4. Place the speed control pedal in “NEUTRAL” position.
5. Shift the PTO clutch lever to “OFF” position.

■ Test : Switch for the speed control pedal
1. Depress the speed control pedal.
2. Turn the key to “START” position.
3. The engine must not crank.

■ Test : Switch for the PTO clutch lever
1. Place the speed control pedal in “NEUTRAL” position.
2. Shift the PTO clutch lever to “ON” position.
3. Turn the key to “START” position.
4. The engine must not crank.

(1) Range Gear Shift Lever (L-M-H)  (3) Speed Control Pedal
(2) PTO Clutch Lever

Checking Engine Start System (Manual Transmission Model)

⚠️ CAUTION
- Do not allow anyone near the tractor while testing.
- If the tractor does not pass the test, do not operate the tractor.

■ Preparation before testing.
1. Sit on the operator’s seat.
2. Set the parking brake and stop the engine.
3. Place the shuttle shift lever in “NEUTRAL” position.
4. Shift the PTO ON-OFF lever to “OFF” position.

■ Test : Switch for the shuttle shift lever
1. Shift the shuttle shift lever to the forward or reverse position.
2. Fully depress the clutch pedal and turn the key to “START” position.
3. The engine must not crank.

■ Test : Switch for the PTO ON-OFF lever
1. Engage the PTO ON-OFF lever to “ON” position.
2. Shift the shuttle shift lever to the “NEUTRAL” position.
3. Turn the key to “START” position.
4. The engine must not crank.

(1) Shuttle Shift Lever  (3) PTO ON-OFF Lever
(2) Clutch Pedal  (4) Range Gear Shift Lever (L-M-H)
Greasing
1. Apply a small amount of multipurpose grease to the positions as shown in the figures.

(1) Speed Control Pedal (HST Pedal)  (3) Lifting Rod (RH)
(2) Top Link  (4) Battery Terminal

Checking Wheel Mounting Bolts and Nuts Tightening Torques

⚠️ CAUTION
- Never operate tractor with a loose rim, wheel, or axle.
- Any time bolts and nuts are loosened, retighten to specified torque.
- Check all bolts and nuts frequently and keep them tight.

1. Check wheel bolts and nuts regularly especially when new. If they are loose, tighten them as follows.

<table>
<thead>
<tr>
<th>Component</th>
<th>Front wheel mounting nut</th>
<th>Rear wheel mounting bolt</th>
<th>Rear wheel mounting nut</th>

Checking Battery Condition

**DANGER**
- Do not use or charge the refillable type battery if the fluid level is below the LOWER (lower limit level) mark. Otherwise, the battery component parts may prematurely deteriorate, which may shorten the battery’s service life or cause an explosion. Check the fluid level regularly and add distilled water as required so that the fluid level is between the UPPER and LOWER levels.

**CAUTION**
- Never remove the vent plugs while the engine is running.
- Keep electrolyte away from eyes, hands and clothes. If you are spattered with it, wash it away completely with water immediately and get medical attention.
- Wear eye protection and rubber gloves when working around battery.

**NOTE**
- The factory-installed battery is of non-refillable type. If the indicator turns white, do not charge the battery but replace it with new one.
1. Mishandling the battery shortens the service life and adds to maintenance costs.
2. The original battery is maintenance free type battery, needs some servicing. If the battery is weak, the engine is difficult to start and the lights be dim. It is important to check the battery periodically.

(1) Vent Cap

A : Upper Level
B : Lower Level

W1015551
Checking Battery Condition (Continued)

**CAUTION**

- When the battery is being activated, hydrogen and oxygen gases in the battery are extremely explosive. Keep open sparks and flames away from the battery at all times, especially when charging the battery.
- When charging the battery, ensure the vent caps are securely in place. (If equipped.)
- When disconnecting the cable from the battery, start with the negative terminal first.
- When connecting the cable to the battery, start with the positive terminal first.
- Never check battery charge by placing a metal object across the posts.
- Use a voltmeter or hydrometer.

(For accessible maintainable type batteries with removable vent caps.)

1. Make sure each electrolyte level is to the bottom of vent wells, if necessary add distilled water in a well-ventilated area.
2. The water in the electrolyte evaporates during recharging. Liquid shortage damages the battery. Excessive liquid spills over and damages the tractor body.
3. To slow charge the battery, connect the battery positive terminal to the charger positive terminal and the negative to the negative, then recharge in the normal manner.
4. A boost charge is only for emergencies. It will partially charge the battery at a high rate and in a short time.
   - When using a boost-charged battery, it is necessary to recharge the battery as early as possible.
   - Failure to do this will shorten the battery's service life.
5. When the specific gravity of electrolyte is between 1.27 and 1.29, the charging is completed.
6. When exchanging an old battery for a new one, use battery of equal specification shown in **TABLE 1**.

<table>
<thead>
<tr>

<td>12</td>
<td>36</td>
<td>79</td>
<td>433</td>
<td>4.5</td>
</tr>
</tbody>
</table>

**Battery Storage**

1. When storing the tractor for a long period, remove the battery from tractor, adjust the electrolyte to the proper level and store in a dry place out of direct sunlight.
2. The battery self-discharges while it is stored.
   - Recharge it once every three months in hot seasons and once every six months in cold seasons.

(1) Vent Cap

A : Upper Level
B : Lower Level
Cleaning Air Cleaner Primary Element

1. Remove the air cleaner cover (3) and element (primary) (5) or (2).
2. Clean the element (primary) (2):
   - When dry dust adheres to the element, blow compressed air from the inside, turning the element. Pressure of compressed air must be under 205 kPa (2.1 kgf/cm², 30 psi).
   - When carbon or oil adheres to the element, soak the element in detergent for 15 minutes then wash it several times in water, rinse with clean water and dry it naturally. After element is fully dried, inspect inside of the element with a light and check if it is damaged or not.
3. When replacing the air cleaner element (primary) (2), replace the secondary element (4) as well:
   Once a year or after every six times of cleaning, whichever comes first.

■ IMPORTANT
- The air cleaner uses a dry element, never apply oil.
- Do not run the engine with filter element removed.
- Be sure to refit the dust cup with the arrow ↑ (on the rear of cup) upright. If the dust cup is improperly fitted, evacuator valve will not function and dust will adhere to the element.
- Do not touch the secondary element except in cases where replacing is required.
- To prevent serious damages to the engine, use only a KUBOTA genuine filter.

■ Evacuator Valve
Open the evacuator valve (4) once a week under ordinary conditions or daily when used in a dusty place to get rid of large particles of dust and dirt.

(1) Secondary (Safety) Element  [A] Double Element Type
(2) Primary Element  [B] Single Element Type
(3) Cover
(4) Evacuator Valve
(5) Element

W1017166
Cleaning Fuel Filter Element

This job should not be done in the field, but in a clean place.

1. Place the oil pan underneath the fuel filter. Loosen and remove the filter bowl, and rinse the inside with kerosene.
2. Take out the element and dip it in the kerosene to rinse.
3. After cleaning, reassemble the fuel filter, keeping out dust and dirt.
4. Bleed the fuel system. (Refer to page G-41.)

**IMPORTANT**

- When the fuel filter bowl has been removed, fuel stops flowing from the fuel tank. If the fuel tank is almost full, however, the fuel will flow back from the fuel return pipe to the fuel filter. Before checking, make sure the fuel tank is less than half-full.
- If dust, dirt or water enters the fuel system, the fuel pump and injection nozzles are subject to premature wear. To prevent this, be sure to clean the fuel filter bowl and element periodically.

(1) Fuel Filter Bowl  A : Loosen
(2) O-ring  B : Tighten
(3) Fuel Filter Element
(4) O-ring

Adjusting Fan Belt Tension

**CAUTION**

- Be sure to stop engine before checking belt tension.

1. Stop the engine and remove the key.
2. Apply moderate thumb pressure to belt between pulleys.
3. If tension is incorrect, loosen the alternator mounting bolts and using a lever placed between the alternator and the engine block, pull the alternator out until the deflection of the belt falls within acceptable limits.
4. Replace fan belt if it is damaged.

<table>
<thead>
<tr>
<th>Fan belt tension</th>
<th>Factory spec.</th>
</tr>
</thead>
</table>

A deflection of between 7 to 9 mm (0.28 to 0.34 in.) when the belt is pressed in the middle of the span.

(1) Adjusting Screw  A : Check the belt tension
(2) Fan Belt  B : To tighten
Adjusting Brake Pedal Free Travel

**CAUTION**
- Stop the engine and chock the wheels before checking brake pedal.

1. Release the parking brake.
2. Slightly depress the brake pedals and measure free travel at the top of pedal stroke.
3. If adjustment is needed, loosen the lock nut and turn the turnbuckle to adjust the rod length within acceptable limits.
4. Retighten the lock nut.

<table>
<thead>
<tr>
<th>Proper brake pedal free travel</th>

(4) Lock Nut

Checking Parking Brake Lever Travel

1. Pull the parking brake lever (1) to the parking position while counting the ratchet sound made by the parking brake lever (1).
2. If the counted ratchet sound is not within the factory specification, adjust the parking brake lever travel.

**CAUTION**
- Stop the engine and remove the key, and the chock wheels before checking parking brake.

(When adjusting)

1. Release the parking brake lever.
2. Be sure to adjust the free travel of the right and left brake pedals.
3. Place the jack under the transmission case, then remove the rear tires and set the rigid rack under the rear axles.
4. Loosen the lock nuts (2) of the right and left rods (6).
5. Tighten the adjusting nut (3) of the right rod (6) by hand until the collar (4) comes into contact with the arm (5). Make half and one more turn of the nut.
6. Tighten the adjusting nut (3) of the left rod (6) by hand until the collar (4) comes into contact with the arm (5).
7. Tighten up the lock nuts (2) of right and left rods.
8. Make sure the parking brake lever gets locked at the its 4th or 5th notch.
9. Install the right and left tires.

**NOTE**
- After adjusting the parking brake lever free travel:
  - Right and left parking brake for even braking.
  - With the parking brake released, make sure that the right and left tires do not drag on.
Checking Fuel Line

1. Check to see that all lines and hose clamps are tight and not damaged.
2. If hoses and clamps are found worn or damaged, replace or repair them at once.

**NOTE**
- If the fuel line is removed, be sure to properly bleed the fuel system. (See "Bleeding Fuel System" in as required maintenance.)

(1) Fuel Line   (2) Clamp Band
[5] CHECK POINTS OF EVERY 200 HOURS

Replacing Engine Oil Filter Cartridge

⚠️ CAUTION
- Be sure to stop the engine before changing oil filter cartridge.
- Allow engine to cool down sufficiently, oil can be hot and can burn.
1. Remove the oil filter cartridge with the filter wrench.
2. Apply a slight coat of oil onto the rubber seal of new filter.
3. To install the new cartridge, screw it in by hand an additional 1/2 turn only. Over tightening may cause deformation of rubber gasket.
4. After the new cartridge has been replaced, the engine oil normally decrease a little. Thus see that the engine oil does not leak through the seal and be sure to read the oil level on the dipstick. Then, replenish the engine oil up to the specified level.

■ IMPORTANT
- To prevent serious damage to the engine, replacement filter must be highly efficient. Use only a KUBOTA genuine filter or its equivalent.

W1033527

Checking Radiator Hoses and Clamp

Check to see if radiator hoses (1) are properly fixed every 200 hours of operation or six months, whichever comes first.
1. If clamp bands (2) are loose or water leaks, tighten clamp bands (2) securely.
2. Replace radiator hoses (1) and tighten clamp bands (2) securely, if radiator hoses (1) are swollen, hardened or cracked.
   Replace radiator hoses (1) and clamp bands (2) every 2 years or earlier if checked and found that radiator hoses (1) are swollen, hardened or cracked.

■ Precaution at Overheating
Take the following action in the event the coolant temperature is nearly or more than the boiling point, what is called "Overheating".
1. Park the tractor in a safe place and keep the engine unloaded idling.
2. Do not stop the engine suddenly, but stop it after about 5 minutes of unloaded idling.
3. Keep yourself well away from the machine for further 10 minutes or while the steam blows out.
4. Check that there are no dangers such as burns. Get rid of the causes of overheating according to the manual, see "TROUBLESHOOTING" section, and then, start again the engine.

(1) Engine Oil Filter Cartridge
(2) Clamp Band

W1018562

KiSC issued 03, 2007 A
Checking Intake Air Line
1. Check to see that hoses (1) and hose clamps (2) are tight and not damaged.
2. If hoses (1) and hose clamps (2) are found worn or damaged, replace or repair them at once.

Adjusting Toe-in
1. Park tractor on a flat place.
2. Turn steering wheel so front wheels are in the straight ahead position.
3. Lower the implement, lock the park brake and stop the engine.
4. Measure distance between tire beads at front of tire, hub height.
5. Measure distance between tire beads at rear of tire, hub height.
6. Front distance should be 0 to 10 mm (0 to 0.39 in.) less than rear distance. If not, adjust tie-rod length.

Adjusting procedure
1. Loosen the tie-rod nut (2).
2. Turn the tie-rod joint to adjust the rod length until the proper toe-in measurement is obtained.
3. Retighten the tie-rod nut (2).

Adjusting Air Conditioner Belt Tension (CABIN)

CAUTION
- Apply the parking brake and stop the engine and remove the key.
1. Measure the deflection A, depressing the air conditioner belt halfway between the fan belt drive pulley and the air conditioner tension pulley at specified force (98 N, 10 kgf, 22 lbf).
2. If the measurement is not within the factory specifications, loosen the nut (2) and adjust the adjusting bolt (1).

<table>

</tbody>
</table>
Cleaning the Inner Air Filter (CABIN)
1. Remove the screws (2).
2. Remove the inner filter (1), and blow air from the opposite direction to the filter's normal air flow.
3. Pressure of compressed air must be under 205 kPa (2.1 kgf/cm²).

Cleaning the Fresh Air Filter (CABIN)
1. Remove the knob bolts (3) and pull out the fresh air filter (1).
2. Blow air from the opposite direction to the filter's normal air flow.

**IMPORTANT**
- Do not hit the fresh air filter. If the fresh air filter becomes deformed, dust may enter into the air-conditioner, which may cause damage and malfunction.

**NOTE**
- If the filter is very dirty:
  Dip the filter in lukewarm water with mild dish washing detergent. Move it up and down as well as left and right to loosen dirt. Rinse the filter with clean water and let it air-dry.

**IMPORTANT**
- Do not use gasoline, thinner or similar chemicals to clean the filter as damage to the filter may occur.
- It may also cause an unpleasant odor in the CABIN when the system is used next.

Checking the Air Conditioner Condenser (CABIN)
1. Check air conditioner condenser (1) to be sure that it is clean of debris.

[6] CHECK POINTS OF EVERY 300 HOURS

Changing Transmission Fluid

⚠️ CAUTION
- Be sure to stop the engine when checking and changing the transmission fluid.
- Allow engine to cool down sufficiently, oil can be hot and can burn.

1. Place an oil pan under the tractor.
2. Remove the drain plugs (3), (4) at the bottom of the transmission case and the rear axles.
3. Drain the transmission fluid.
4. After draining, screw in the drain plug.
5. Fill new oil from filling port after removing the filling plug (2) up to the upper notch on the dipstick (1).
6. After running the engine for a few minutes, stop it and check the oil level again, if low, add oil to the prescribed level.

⚠️ IMPORTANT
- Use only multi-grade transmission oil. Use of other oils may damage the transmission or hydraulic system. Refer to "LUBRICANTS, FUEL AND COOLANT" (See page G-7.)
- Never work the tractor immediately after changing the transmission oil. Keeping the engine at medium speed for a few minutes to prevents damage to the transmission.
- Do not mix different brands oil together.

| Transmission fluid capacity | B1830, B2230, B2530 Manual transmission (without Bi-Speed Turn) | 15 L  
|                            |                                                        | 4.0 U.S.gals  
|                            |                                                        | 3.3 Imp.gals  
|                            | B1830, B2230, B2530 Manual transmission (with Bi-Speed Turn) | 16.5 L  
|                            |                                                        | 4.4 U.S.gals  
|                            |                                                        | 3.6 Imp.gals  
|                            | B1830HST, B2230HST, B2530HST                           | 17 L  
|                            |                                                        | 4.5 U.S.gals  
|                            |                                                        | 3.7 Imp.gals  
|                            | B3030HST                                                | 17 L  
|                            |                                                        | 4.5 U.S.gals  
|                            |                                                        | 3.7 Imp.gals  

(A) Oil level is acceptable within this range.

(2) Filling Plug  
(3) Drain Plug  
(4) Drain Plug (Rear Axle Case)
Replacing Transmission Oil Filter Cartridge

**CAUTION**
- Be sure to stop the engine before changing the oil filters.
- Allow engine to cool down sufficiently, oil can be hot and can burn.

1. Drain the transmission fluid.
2. Remove the both oil filter cartridges by using a filter wrench.
3. Apply a slight coat of oil onto the new cartridge gasket.
4. To install the new cartridge, screw it in by hand. Over tightening may cause deformation of rubber gasket.
5. After the new cartridge has been replaced, the transmission fluid level will normally decrease slightly. Make sure that the transmission fluid does not leak through the seal. Check the fluid level.

**IMPORTANT**
- To prevent serious damage to the hydraulic system. Use only a genuine KUBOTA filter or its equivalents.

Changing Front Axle Case Oil

1. Park the tractor on a firm, flat and level surface.
2. To drain the used oil, remove the right and left drain plugs and filling plug at the front axle case and drain the oil completely into the oil pan.
3. After draining, reinstall the drain plugs.
4. Fill with new oil up to the upper notch on the dipstick.
   Refer to "LUBRICANTS, FUEL AND COOLANT". (See page G-7.)

**IMPORTANT**
- After ten minutes, check the oil level again; add oil to prescribed level.
5. After filling, reinstall the filling plug.
6. Properly dispose of used oil.

(1) Filling Plug with Dipstick  (2) Drain Plug  (A) Oil level is acceptable within this range.
[7] CHECK POINTS OF EVERY 400 HOURS

Adjusting Front Axle Pivot (Front Axle Locking Force)
1. Jack up the front side of tractor.
2. Set a spring balance to the front axle flange.
3. Measure the front axle locking force.
4. If the measurement is not within the factory specifications, adjust with the adjusting screw (2). After applying liquid gasket Three Bond 1206D or equivalent to the thread portion of the adjusting screw (2) to prevent front axle oil from leaking out of the front axle holder (3).
5. Tighten the lock nut (2) firmly.

Replacing Fuel Filter Element
This job should not be done in the field, but in a clean place.
1. Place the oil pan underneath the fuel filter. Loosen and remove the filter bowl, and rinse the inside with kerosene.
2. Take out the element and dip it in the kerosene to rinse.
3. After cleaning, reassemble the fuel filter, keeping out dust and dirt.
4. Bleed the fuel system. (Refer to page G-40.).

IMPORTANT
- To prevent serious damage to the fuel system, use only a KUBOTA genuine fuel filter element.
- When the fuel filter bowl has been removed, fuel stops flowing from the fuel tank. If the fuel tank is almost full, however, the fuel will flow back from the fuel return pipe to the fuel filter. Before checking, make sure the fuel tank is less than half-full.
- If dust, dirt or water enters the fuel system, the fuel pump and injection nozzles are subject to premature wear. To prevent this, be sure to clean the fuel filter bowl and element periodically.
[8] CHECK POINT OF EVERY 800 HOURS

Valve Clearance 1 (ROPS Model)

**IMPORTANT**
- Valve clearance must be checked and adjusted when engine is cold.
  1. Remove the head cover, the glow plugs and the timing window cover on the clutch housing.
  2. Align the "1TC" mark line on the flywheel and center of timing window so that the No. 1 piston comes to the compression top dead center.
  3. Check the following valve clearance marked with "✩" using a feeler gauge.
  4. If the clearance is not within the factory specifications, adjust with the adjusting screw.

**NOTE**
- The "TC" marking line on the flywheel is just for No. 1 cylinder. There is no "TC" marking for the other cylinders.
- No. 1 piston comes to the T.D.C. position when the "TC" marking line is aligned with center of timing window on front case. Turn the flywheel 0.26 rad (15°) clockwise and counterclockwise to see if the piston is at the compression top dead center or the overlap position. Now referring to the table below, readjust the valve clearance. (The piston is at the compression top dead center when both the IN. and EX. valves do not move; it is at the overlap position when both the valves move.)
- Finally turn the flywheel 6.28 rad (360°) and align the "TC" marking line and the center of timing window. Adjust all the other valve clearance as required
- After turning the flywheel counterclockwise twice or three times, recheck the valve clearance, firmly tighten the lock nut of the adjusting screw.

<table>
<thead>

(1) Adjusting Washer

W10182100
[10] CHECK POINT OF EVERY 1 YEAR

Replacing Air Cleaner Element
1. Remove the air cleaner cover (3) and element (5) (or primary (2)).
2. When replacing the air cleaner element (5) (or primary (2)), replace the secondary element (4) as well:
   Once a year or after every six times of cleaning, whichever comes first.

- IMPORTANT
  • To prevent serious damage to the air intake system, use only a KUBOTA genuine air element.
  • The air cleaner uses a dry element, never apply oil.
  • Do not run the engine with filter element removed.
  • Be sure to refit the dust cup with the arrow ↑ (on the rear of cup) upright. If the dust cup is improperly fitted, evacuator valve will not function and dust will adhere to the element.
  • Do not touch the secondary element except in cases where replacing is required.
  • To prevent serious damages to the engine, use only a KUBOTA genuine filter.

Evacuator Valves
Open the evacuator valve (2) once a week under ordinary conditions or daily when used in a dusty place to get rid of large particles of dust and dirt.

(1) Secondary (Safety) Element  (2) Primary Element  (3) Cover  (4) Evacuator Valve  (5) Element

[A] Double Element Type  [B] Single Element Type
Checking the Air Conditioner Pipe and Hose (CABIN)
1. Check to see that all lines and hose clamps are tight and not damaged.
2. If pipes, hoses and clamps are found worn and damaged, replace them.
   (1) Pipe  (2) Hose  (3) Clamp

Checking the CAB Isolation Cushion (CABIN)
1. Check the cushion (1) for any breakage or fatigue. Replace them if they have deteriorated.
   (1) Cushion

Replacing Radiator Hose and Clamp Band
1. Replace the radiator hoses (1) and tighten the clamp bands (2) securely if the radiator hoses (1) are swollen, hardened or cracked.

(1) Radiator Hose
(2) Clamp Band

Replacing Fuel Line
1. If fuel line (1) and clamp bands (2) are found worn or damaged, replace them at once.

■ NOTE
- If the fuel line is replaced, be sure to properly bleed the fuel system. Refer to page G-40.

(1) Fuel Line
(2) Clamp Band

Replacing Intake Air Line
1. If hoses (1) and hose clamps (2) are found worn or damaged, replace them at once.

(1) Hose
(2) Hose Clamp
Flushing Cooling System and Changing Coolant

**CAUTION**
- Do not remove radiator cap while coolant is hot. When cool, slowly rotate cap to the first stop and allow sufficient time for excess pressure to escape before removing the cap completely.

1. Stop the engine, remove the key and let it cool down.
2. To drain the coolant, open the radiator drain cock (2), and remove radiator cap (1). The radiator cap (1) must be removed to completely drain the coolant.
3. After all coolant is drained, close the drain cock (2).
4. Fill with clean water and cooling system cleaner.
5. Follow directions of the cleaner instruction.
6. After flushing, fill with clean water and anti-freeze until the coolant level is just below the radiator cap. Install the radiator cap securely.
7. Fill with coolant up to the "FULL" mark of recovery tank.
8. Start and operate the engine for few minutes.
9. Stop the engine, remove the key and let cool.
10. Check coolant level of recovery tank and add coolant if necessary.
11. Properly dispose of used coolant.

**IMPORTANT**
- Do not start engine without coolant.
- Use clean, fresh water and anti-freeze to fill the radiator and recovery tank.
- When the anti-freeze is mixed with water, the anti-freeze mixing ratio must be less than 50%.
- Securely tighten radiator cap. If the cap is loose or improperly fitted, water may leak out and the engine could overheat.

<table>

Flushing Cooling system and Changing Coolant (Continued)

■ Anti-Freeze

⚠️ CAUTION

- When using antifreeze, put on some protection such as rubber gloves (Anti-freeze contains position).
- If should drink anti-freeze, throw up at once and take medical attention.
- When anti-freeze comes in contact with the skin or clothing, wash it off immediately.
- Do not mix different types od Anti-freeze. The mixture can produce chemical reaction causing harmful substances.
- Anti-freeze is extremely flammable and explosive under certain conditions. Keep fire and children away from anti-freeze.
- When draining fluids from the engine, place some container underneath the engine body.
- Do not pour water onto the grounds, down a drain, or into any water source.
- Also, observe the relevant environmental protection regulations when disposing of anti-freeze.

   If it freezes, coolant can damage the cylinders and radiator. If the ambient temperature falls below 0 °C (32 °F) or before a long-term storage, let out cooling water completely, or mix fresh water with long-life coolant and fill the radiator and reserve tank with the mixture.

1. Long-life coolant (hereafter LLC) comes in several types. Use ethylene glycol (EG) type for this engine.
2. Before employing LLC-mixed cooling water, fill the radiator with fresh water and empty it again.
3. Mixing the LLC
   
   Put the LLC in cooling water in the percentage (%) for a target temperature. When mixing, stir it up well, and then fill into the radiator.
4. The procedure for the mixing water and anti-freeze differs according to the make of the anti-freeze and the ambient temperature. Refer to SAE J1034 standard, more specifically also to SAE J814c.
Flushing Cooling system and Changing Coolant (Continued)

**IMPORTANT**
- When the anti-freeze is mixed with water, the anti-freeze mixing ratio must be less than 50%.

<table>
<thead>
<tr>
<th>Vol % Anti-freeze</th>
<th>Freezing Point</th>
<th>Boiling Point*</th>
</tr>
</thead>

</tr>
<tr>
<td>50</td>
<td>–37</td>
<td>–34</td>
</tr>
</tbody>
</table>

* At 760 mmHg pressure (atmospheric). A higher boiling point is obtained by using a radiator pressure cap which permits the development of pressure within the cooling system.

1. Adding the LLC.
   - Add only water if the mixture reduces in amount by evaporation.
   - If there is a mixture leak, add the LLC of the same manufacture and type in the same mixture percentage.
   * Never add any long-life coolant of different manufacturer.
   (Different bands may have different additive components, and the engine may fail to perform as specified.)

2. When the LLC is mixed, do not employ any radiator cleaning agent. The LLC contains anticorrosive agent. If mixed with the cleaning agent, sludge may build up, adversely affecting the engine parts.

3. Kubota's genuine long-life coolant has a service life of 2 years. Be sure to change the coolant every 2 years.

**NOTE**
- The above data represent industry standards that necessitate a minimum glycol content in the concentrated anti-freeze.
- When the coolant level drops due to evaporation, add water only to keep the anti-freeze mixing ratio less than 50%. In case of leakage, add anti-freeze and water in the specified mixing ratio before filling in to the radiator.
[12] OTHERS

Bleeding Fuel
Air must be removed:
1. When the fuel filter or lines are removed.
2. When the tank is completely empty.
3. After the tractor has not been used for a long period of time.

**Bleeding procedure:**
1. Fill the fuel tank with fuel.
2. Start the engine and run for about 30 seconds, and then stop the engine.

**NOTE**
- If the fuel line is removed, be sure to properly bleed the fuel system.

Draining Clutch Housing Water

**NOTE**
- The tractor is equipped with drain plug (1) under the clutch housing.
- After operating in rain, snow, or tractor has been washed, water may get into the clutch housing.
1. Remove the drain plug (1) and drain the water, then install the plug again.

Lubricating Hinges (CABIN)
1. Lubricate the door hinges (1) and the rear window hinges (2) with a proper amount of grease.

Adding the Washer Liquid (CABIN)
1. Add a proper amount of automobile washer liquid.

Replacing Fuse (ROPS)
1. The tractor electrical system is protected from potential damage by fuses.
   A blown fuse indicates that there is an overload or short somewhere in the electrical system.
2. If any of the fuses should blow, replace with a new one of the same capacity.

**IMPORTANT**
• Before replacing a blown fuse, determine why the fuse blew and make any necessary repairs. Failure to follow this procedure may result in serious damage to the tractor electrical system. Refer to troubleshooting section of this manual.
If any of them should blow, replace with a new one of the same capacity.

Checking Refrigerant (Gas) (CABIN)

⚠ CAUTION
- Liquid contact with eyes or skin may cause frostbite.
- In the event of a leakage, wear safety goggles. Escaping refrigerant can cause severe injuries to eyes.
- In contact with a flame, R134a refrigerant gives a toxic gas.
- Do not disconnect any part of the refrigeration circuit of the air conditioning system.

■ Checking procedure
1. Run the air-conditioner in the following conditions.
   - Engine speed: About 1500 min⁻¹ (rpm)
   - Temperature control lever: Maximum cooling position (leftmost)
   - Fan switch: Highest blow (HI)
   - Air-conditioner switch: ON
2. Look into the sight glass (1) to see if the refrigerant is flowing through its circuit.

■ IMPORTANT
- Charge only with R134a not R12 refrigerant (gas).

(Reference)
- (A) Proper: Little or no air bubbles in the refrigerant flow.
- (B) Low: Lots of air bubbles in the refrigerant flow (air bubbles or foam passing continuously).
- (C) Overfull or no refrigerant: Colorless and transparent.

(1) Sight Glass

(A) Proper
(B) Low
(C) Overfull or no refrigerant
8. SPECIAL TOOLS

[1] SPECIAL TOOLS FOR ENGINE

Special Use Puller Set
Code No.: 07916-09032
Application: Use exclusively for pulling out bearing, gears and other parts with ease.

Piston Ring Compressor
Code No.: 07909-32111
Application: Use exclusively for pushing in the piston with piston rings into the cylinder.

Piston Ring Tool
Code No.: 07909-32121
Application: Use exclusively for removing or installing the piston ring with ease.

Diesel Engine Compression Tester (for Glow Plug)
Code No.: 07909-39081 (Assembly) 07909-31301 (L) 07909-31291 (K) 07909-31311 (M)
Application: Use to measure diesel engine compression and diagnostics of need for major overhaul.

**Valve Seat Cutter**

Code No.: 07909-33102

Application: Use to reseat valves.

Angle: 0.785 rad (45°)  
0.262 rad (15°)

Diameter: 28.6 mm (1.126 in.) 38.0 mm (1.496 in.)  
31.6 mm (1.244 in.) 41.3 mm (1.626 in.)  
35.0 mm (1.378 in.) 50.8 mm (2.000 in.)

**Radiator Tester**

Code No.: 07909-31551

Application: Use to check radiator cap pressure, and leaks from cooling system.

Remarks: Adaptor (1) BANZAI Code No. RCT-2A-30S

**Connecting Rod Alignment Tool**

Code No.: 07909-31661

Application: Use to check the connecting rod alignment.

Applicable: Connecting rod big end I.D. range 30 to 75 mm (1.18 to 2.95 in.) dia.

Connecting rod length 65 to 300 mm (2.56 to 11.81 in.)

**Nozzle Tester**

Code No.: 07909-31361

Application: Use to check the fuel injection pressure and spray pattern of nozzle.

Measuring: 0 to 50 MPa range (0 to 500 kgf/cm², 0 to 7000 psi)

**Plastigage**

Code No.: 07909-30241

Application: Use to check the oil clearance between crankshaft and bearing, etc..

Measuring: Green 0.025 to 0.076 mm (0.001 to 0.003 in.)

range Red 0.051 to 0.152 mm (0.002 to 0.006 in.)

Blue 0.102 to 0.229 mm (0.004 to 0.009 in.)
**Red Check**

Code No.: 07909-31371

Application: Use to check cracks on cylinder head, cylinder block, etc..

[2] SPECIAL TOOLS FOR TRACTOR

Steering Wheel Puller
Code No.: 07916-51090
Application: Use for removing the steering wheel without damaging the steering shaft.

Toe-in Gauge
Code No.: 07909-31681
Application: This allows easy measurement of toe-in for all machine models.

Relief Valve Pressure Tester
Code No.: 07916-50045
Application: This allows easy measurement of relief set pressure.

Flow Meter
Code No.: 07916-52791 (Flow Meter)
07916-52651 (Hydraulic Test Hose)
Application: This allows easy testing of hydraulic system.

Adaptor Set for Flow Meter
Code No.: 07916-54031
Application: Use for testing the hydraulic system.

[3] SPECIAL TOOLS FOR CABIN

NOTE
- Special tools for R134a refrigerant air conditioning system introduced below are available from DENSO CO.LTD..

Air Conditioner Service Tool
Code No: DENSO.CO. 95048-00061
Application: Use for charging, testing or discharging the air conditioning system.

Electric Gas Leak Tester
Code No: DENSO 95146-00060
Application: Use for gas leak testing the air conditioning system.

Vacuum Pump
Code No: DENSO 95046-00040 (AC220V)
95046-00050 (AC240V)
Application: Use for evacuating the air conditioning system.
Adaptor (For R134a)
Code No: DENSO 95048-10190 (AC220V)
95048-10200 (AC240V)
Application: Use for evacuating the air conditioning system.

Stopper Magnet Clutch (For A/C Compressor)

Application: Use for loosen and tighten the magnet clutch mounting nut.

NOTE
- This special tool is not provided, so make it referring to the figure.

9. TIRES

[1] TIRE PRESSURE

⚠️ WARNING
- Do not attempt to mount a tire on a rim. This should be done by a qualified person with the proper equipment.
- Always maintain the correct tire pressure. Do not inflate tires above the recommended pressure shown in the operator's manual.

Though the tire pressure is factory-set to the prescribed level, it naturally drops slowly in the course of time. Thus, check it everyday and inflate as necessary.

[B1830, B2230, B2530]

■ NOTE
- Maintain the maximum recommended pressure in the front tires, when using a front loader or when equipped with a full load of front weights.

■ Dual Tires
Dual tires are not approved.
[2] TREAD

**CAUTION**
- Support tractor securely on stands before removing a wheel.
- Never operate tractor with a loose rim, wheel or axle.

**IMPORTANT**
- Always attach tires as shown in the figure.
- If not attached as the figure, transmission parts may be damaged.
- Do not use tires larger than specified.

Wheel Mounting Bolts and Nuts

**CAUTION**
- Never operate tractor with a loose rim, wheel or axle.
- Any time bolts and nuts are loosened, retighten to specified torque.
- Check all bolts and nuts frequently and keep them tight.

Check wheel bolts and nuts regularly especially when new. If they are loose, tighten them as follows.

<table>

(1) Rear Wheel Mounting Bolt  (2) Rear Wheel Mounting Nut  (3) Front Wheel Mounting Nut

KiSC issued 03, 2007 A
(1) Front Wheels

Front wheel tread can not be adjusted.

**IMPORTANT**
- Do not turn front discs to obtain wider tread. In setting up the front wheels, make sure that the inflation valve stem of the tires face outward.

(2) Rear Wheels

**IMPORTANT**
- When working on slopes or working with trailer, set the wheel tread as wide as practical for the job for maximum stability.
  Rear tread can be adjusted as shown with the standard equipped tires to change tread.

1. Loosen the nut of cotter pin bolt.
2. Remove the snap pin and wheel hub pin.
3. Change the tread to the desired position.
4. Re-set the wheel hub pin, snap pin and cotter pin bolt.

[3] TIRE LIQUID INJECTION AND BALLAST

Auxiliary weights can be used to increase traction force for plowing in fields or clayey ground. Another way is to inject water or another liquid, such as a calcium chloride solution in the tires. Water must not be used in winter since it freezes at 0 °C (32 °F). The calcium chloride solution will not freeze and moreover, affords higher effect than water since its specific gravity is higher than that of water by about 20 %. Below is an explanation of calcium chloride solution injection.

**IMPORTANT**
- Do not fill the front tires with liquid.

**Preparation of Calcium Chloride Solution**

**CAUTION**
- When making a calcium chloride solution, do not pour water over calcium chloride since this results in chemical reaction which will cause high temperature. Instead add a small amount of calcium chloride to the water at a time until the desired solution is achieved.

<table>
<thead>

</tbody>
</table>

(a) Water          A : Bad
(b) CaCl₂ (Calcium Chloride) B : Good

**Attaching Injector**
1. Lift the rear tires off the ground.
2. Turn the tire so that the air valve is at the top.
3. Remove the air valve, and attach the injector. (Code No. 07916-52501).

(1) Injector       (2) Hose
**Injection and Rear Ballast**

**CAUTION**
- When a calcium chloride solution is used, cool it before pouring it into the tire.
- Do not fill tires with water or solution more than 75% of full capacity (to the valve stem level).

The following four ways can be used to inject water or a calcium chloride solution into tires.
1. Gravity injection (Fig. 1)
2. Pump injection (Fig. 2)
3. Pressure tank injection (Fig. 3)
4. Injection directly from top (only when water is being used)

**NOTE**
- Once injection is completed, reset the air valve, and pump air into the tire to the specified pressure.

**Liquid Ballast in Rear Tires : Liquid weight pen tire (75% filled)**

Front Ballast

Add weights in needed for stability and improving traction. Heavy pulling and heavy rear mounted implements tend to lift front wheels. Add enough ballast to maintain steering control and prevent tip over. Remove weight when no longer needed.

Front End Weights (option)

The front end weights can be attached to the bumper. See your implement operator’s manual for required number of weights.

NOTE

- [For installation of up to three weights]
  Besides the weight, mounting bolt kit(s) are required for mounting the weight.
- [For installation of up to five weights]
  Besides the weight, a front weight bracket and mounting bolt kit(s) are required for mounting the weight.

IMPORTANT

- Do not overload tires.
- Add no more weight than indicated in chart.

10. IMPLEMENT LIMITATIONS

The KUBOTA Tractor has been thoroughly tested for proper performance with implements sold or approved by KUBOTA. Use with implements which are not sold or approved by KUBOTA and which exceed the maximum specifications listed below, or which are otherwise unfit for use with the KUBOTA Tractor may result in malfunctions or failures of the tractor, damage to other property and injury to the operator or others. [Any malfunctions or failures of the tractor resulting from use with improper implements are not covered by the warranty.]

3. TIGHTENING TORQUES

Tightening torque of screws, bolts and nuts on the table below are specially specified. (For general use screws, bolts and nuts : See page G-8.)

**NOTE**
- In removing and applying the bolts and nuts marked with "*", a pneumatic wrench or similar pneumatic tool, if employed, must be used with enough care not to get them seized.
- For "*" marked screws, bolts and nuts on the table, apply engine oil to their threads and seats before tightening.
- The letter "M" in Size × Pitch means that the screw, bolt or nut dimension stands for metric. The size is the nominal outside diameter in mm of the threads. The pitch is the nominal distance in mm between two threads.

4. CHECKING, DISASSEMBLING AND SERVICING

[1] CHECKING AND ADJUSTING

(1) Engine Body

Compression Pressure
1. Run the engine until it is warmed up.
2. Stop the engine.
3. Remove the air cleaner, the muffler and all glow plugs (or nozzles).
4. Set a compression tester with the adaptor to the glow plug hole (or nozzle hole).
   Nozzle Hole : Adaptor H
   Glow Plug Hole : Adaptor L
5. After making sure that the stop lever is set at the stop position (non-injection), run the engine with the starter and measure the compression pressure.
6. Repeat steps 4 and 5 for each cylinder.
7. If the measurement is below the allowable limit, apply a small amount of oil to the cylinder wall through the glow plug hole (or nozzle hole) and measure the compression pressure again.
8. If the compression pressure is still less than the allowable limit, check the top clearance, valve clearance and cylinder head.
9. If the compression pressure increases after applying oil, check the cylinder wall and piston rings.

**NOTE**
- Check the compression pressure with the specified valve clearance.
- Always use a fully charged battery for performing this test.
- Variances in cylinder compression values should be under 10%.

<table>
<thead>
<tr>
<th>Compression pressure</th>

</tbody>
</table>

KiSC issued 03, 2007 A
Valve Clearance 1 (ROPS Model)

■ IMPORTANT
- Valve clearance must be checked and adjusted when engine is cold.
1. Remove the head cover, the glow plugs and the timing window cover on the clutch housing.
2. Align the "1TC" mark line on the flywheel and center of timing window so that the No. 1 piston comes to the compression top dead center.
3. Check the following valve clearance marked with "✩" using a feeler gauge.
4. If the clearance is not within the factory specifications, adjust with the adjusting screw.

<table>
<thead>
<tr>
<th>Valve clearance</th>
<th>Factory spec.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.145 to 0.185 mm</td>
</tr>
<tr>
<td></td>
<td>0.0057 to 0.0073 in.</td>
</tr>
</tbody>
</table>

■ NOTE
- The "TC" marking line on the flywheel is just for No. 1 cylinder. There is no "TC" marking for the other cylinders.
- No. 1 piston comes to the T.D.C. position when the "TC" marking line is aligned with center of timing window on front case. Turn the flywheel 0.26 rad (15 °) clockwise and counterclockwise to see if the piston is at the compression top dead center or the overlap position. Now referring to the table below, readjust the valve clearance. (The piston is at the compression top dead center when both the IN. and EX. valves do not move; it is at the overlap position when both the valves move.)
- Finally turn the flywheel 6.28 rad (360 °) and align the "TC" marking line and the center of timing window. Adjust all the other valve clearance as required
- After turning the flywheel counterclockwise twice or three times, recheck the valve clearance, firmly tighten the lock nut of the adjusting screw.

<table>
<thead>

</tbody>
</table>

✱ : Valve clearance is adjustable.
1) Timing Window
2) TC Mark Line

A : Valve Clearance
Valve Clearance 2 (CABIN Model)

**IMPORTANT**
- Valve clearance must be checked and adjusted when engine is cold.
1. Remove the head cover and the glow plugs.
2. Check and adjust the valve clearance at the both valves compression top dead center.
3. If the clearance is not within the factory specifications, adjust with the adjusting screw.
- Firing order
  - 3-cylinder: 1 → 2 → 3
  - 4-cylinder: 1 → 3 → 4 → 2
- Check and adjust the valve clearance following the firing order shown above.

<table>
<thead>
<tr>

</tbody>
</table>

(1) Adjusting Screw  
(2) Lock Nut

A : Valve Clearance

(2) Lubricating System

Engine Oil Pressure
1. Remove the engine oil pressure switch, and set an oil pressure tester.
2. Start the engine. After warming up, measure the oil pressure of both idling and rated speeds.
3. If the oil pressure is less than the allowable limit, check the following.
   - Engine oil insufficient
   - Oil pump defective
   - Oil strainer clogged
   - Oil filter cartridge clogged
   - Oil gallery clogged
   - Excessive oil clearance
   - Foreign matter in the relief valve

<table>

</tr>
<tr>
<td></td>
<td>10.8 to 14.5 lbf·ft</td>
</tr>
</tbody>
</table>
(3) Cooling System

**Fan Belt Tension**

1. Measure the deflection (A), depressing the belt halfway between the fan drive pulley and alternator pulley at specified force (98 N, 10 kgf, 22 lbf).
2. If the measurement is not within the factory specifications, loosen the alternator mounting screws and relocate the alternator to adjust.

<table>
<thead>
<tr>
<th>Deflection (A)</th>
<th>Factory spec.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7 to 9 mm</td>
</tr>
<tr>
<td></td>
<td>0.28 to 0.35 in.</td>
</tr>
</tbody>
</table>

**Fan Belt Damage and Wear**

1. Check the fan belt for damage.
2. If the fan belt is damaged, replace it.
3. Check if the fan belt is worn and sunk in the pulley groove.
4. If the fan belt is nearly worn out and deeply sunk in the pulley groove, replace it.

(A) Good (B) Bad

**Thermostat Valve Opening Temperature**

1. Suspend the thermostat in the water by a string with its end inserted between the valve and seat.
2. Heating the water gradually, read the temperature when the valve opens and leaves the string.
3. Continue heating and read the temperature when the valve opens approx. 8 mm (0.315 in.).
4. If the measurement is not within the factory specifications, replace the thermostat.

<table>
<thead>
<tr>
<th>Thermostat's valve opening temperature</th>
<th>Factory spec.</th>

<td>85 °C</td>
</tr>
<tr>
<td></td>
<td>185 °F</td>
</tr>
</tbody>
</table>
**CAUTION**

- When removing the radiator cap, wait at least ten minutes after the engine has stopped and cooled down. Otherwise, hot water may gush out, scalding nearby people.

### Radiator Cap Air Leakage

1. Set a radiator tester (1) and adaptor (2) on the radiator cap.
2. Apply the specified pressure 88 kPa (0.9 kgf/cm², 13 psi), and measure the time for the pressure to fall to 59 kPa (0.6 kgf/cm², 9 psi).
3. If the measurement is less than the factory specification, replace the radiator cap.

<table>
<thead>
<tr>
<th>Pressure falling time</th>
<th>Factory spec.</th>
<th>More than 10 seconds for pressure fall from 88 to 59 kPa (from 0.9 to 0.6 kgf/cm², from 13 to 9 psi)</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Radiator Tester</td>
<td>(2) Adaptor</td>
<td>1025874</td>
</tr>
</tbody>
</table>

### Radiator Water Leakage

1. Pour a specified amount of water into the radiator.
2. Set a radiator tester (1) and an adaptor (2) and raise the water pressure to the specified pressure.
3. Check the radiator for water leaks.
4. For water leak from the pinhole, repair with the radiator cement. When water leak is excessive, replace the radiator.

<table>
<thead>
<tr>
<th>Radiator water leakage test pressure</th>

<th>137 kPa 1.4 kgf/cm² 20 psi</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Radiator Tester</td>
<td>(2) Adaptor</td>
<td>W10553600</td>
</tr>
</tbody>
</table>
(4) Fuel System

**Injection Timing**
1. Remove the injection pipes.
2. Remove the engine stop solenoid.
3. Turn the flywheel counterclockwise (facing the flywheel) until fuel flows from the delivery valve holder.
4. Continue to turn the flywheel slowly, and stop it as soon as the fuel level at the tip of the delivery valve holder begins to increase.
5. Check to see if the timing angle lines on the flywheel is aligned with the alignment mark (2).
6. If the injection timing is out of adjustment, readjust the timing with shims.

<table>
<thead>
<tr>
<th>Injection timing</th>
<th>Factory spec.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.27 to 0.31 rad (16 to 18 °) before T.D.C.</td>
</tr>
</tbody>
</table>

**NOTE**
- The sealant is applied to both sides of the shim (soft metal gasket shim). The liquid gasket is not required for assembling.
- Shims are available in thickness of 0.20 mm (0.0079 in.), 0.25 mm (0.0098 in.) and 0.30 mm (0.0118 in.). Combine these shims for adjustments.
- Addition or reduction of shim (0.05 mm, 0.0020 in.) delays or advances the injection timing by approx. 0.0087 rad (0.5 °).
- In disassembling and replacing the injection pump, be sure to use the same number of new shims with the same thickness.
- Refer to figure below to check the thickness of the shims.

<table>
<thead>
<tr>
<th>(1) Timing Line</th>
<th>(A) Engine mounted on the tractor (ROPS model)</th>

<td></td>
</tr>
<tr>
<td>(6) Without hole : 0.30 mm (0.0118 in.)</td>
<td></td>
</tr>
</tbody>
</table>

**Fuel Tightness of Pump Element**
1. Remove the engine stop solenoid.
2. Remove the injection pipes and glow plugs.
3. Install the injection pump pressure tester to the injection pump.
4. Install the injection nozzle (1) jetted with the proper injection pressure to the injection pump pressure tester (2). (Refer to the photo.)
5. Set the speed control lever to the maximum speed position.
6. Run the starter to increase the pressure.
7. If the pressure can not reach the allowable limit, replace the pump with new one or repair with a Kubota-authorized pump service shop.

<table>
<thead>
<tr>
<th>Fuel tightness of pump element</th>

</table>
Fuel Tightness of Delivery Valve

1. Remove the engine stop solenoid.
2. Remove the injection pipes and glow plugs.
3. Set a pressure tester to the fuel injection pump.
4. Install the injection nozzle (1) jetted with the proper injection pressure to the injection pump pressure tester (2).
5. Run the starter to increase the pressure.
6. Stop the starter when the fuel jets from the injection nozzle.
   After that, turn the flywheel by the hand and raise the pressure to approx. 13.73 MPa (140 kgf/cm², 1991 psi).
7. Now turn the flywheel back about half a turn (to keep the plunger free). Maintain the flywheel at this position and clock the time taken for the pressure to drop from 13.73 to 12.75 MPa (from 140 to 130 kgf/cm², from 1991 to 1849 psi).
8. Measure the time needed to decrease the pressure from 13.73 to 12.75 MPa (from 140 to 130 kgf/cm², from 1991 to 1849 psi).
9. If the measurement is less than allowable limit, replace the pump with new one or repair with a Kubota-authorized pump service shop.

**NOTE**

- Never try to disassemble the injection pump assembly. For repairs, you are strongly requested to contact a Kubota-authorized pump service shop.

1. (1) Injection Nozzle
2. (2) Injection Pump Pressure Tester
3. (3) Protection Cover for Jetted Fuel

Nozzle Spraying Condition

**CAUTION**

- Check the injection pressure and condition after confirming that there is nobody standing in the direction the fume goes.
- If the fume from the nozzle directly injects the human body, cells may be destroyed and blood poisoning may be caused.

1. Set the injection nozzle to a nozzle tester, and check the nozzle spraying condition.
2. If the spraying condition is defective, replace the nozzle piece.

(a) Good  (b) Bad
Fuel Injection Pressure
1. Set the injection nozzle to a nozzle tester.
2. Slowly move the tester handle to measure the pressure at which fuel begins jetting out from the nozzle.
3. If the measurement is not within the factory specifications, replace the adjusting washer (1) in the nozzle holder to adjust it.

(1) Adjusting Washer

Valve Seat Tightness
1. Set the injection nozzle to a nozzle tester.
2. Raise the fuel pressure, and keep at 12.75 MPa (130 kgf/cm², 1849 psi) for 10 seconds.
3. If any fuel leak is found, replace the nozzle piece.

**Nozzle Holder**

1. Secure the nozzle retaining nut (7) with a vise.
2. Remove the nozzle holder (1), and take out parts inside.

*(When reassembling)*

- Assemble the nozzle in clean fuel oil.
- Install the push rod (4), noting its direction.
- After assembling the nozzle, be sure to adjust the fuel injection pressure.

---

**[2] PREPARATION**

**Draining Lubricants and Coolant**

*CAUTION*

- Before changing oil, be sure to stop the engine.

1. Start and warm up the engine for approx. 5 minutes.
2. Place an oil pan underneath the engine.
3. To drain the used oil, remove the drain plug (1) at the bottom of the engine and drain the oil completely.
4. Screw in the drain plug (1).
5. Fill new oil up to upper line on the dipstick (2).

*IMPORTANT*

- When using an oil of different manufacture or viscosity from the previous one, remove all of the old oil.
- Never mix two different types of oil.
- Use the proper SAE Engine Oil according to ambient temperatures.
- Refer to "LUBRICANTS, FUEL AND COOLANT". (See page G-7.)

*(1) Drain Plug  (2) Dipstick  (3) Oil Inlet Plug  (A) Oil level is acceptable within this range.*
**Draining Transmission Fluid**

**CAUTION**
- Stop the engine before checking and changing the transmission fluid.
  1. Place the oil pan under the tractor.
  2. Remove the drain plugs (1) (3) (5) at the mid-PTO shaft and at the bottom of the rear axle cases (4) (6).
  3. Drain the transmission fluid.
  4. After draining the transmission fluid, reinstall the drain plugs (1), (3), (5).

**IMPORTANT**
- Use only KUBOTA UDT oil. Use of other oils may damage the transmission or hydraulic system. Refer to "LUBRICANTS, FUEL AND COOLANT" (See page G-7).
- Never work the tractor immediately after changing the transmission oil. Keep the engine at medium speed for a few minutes to prevent damage to the transmission.
- Do not mix different brands oil together.

Draining Coolant

**CAUTION**
- Do not remove radiator cap while coolant is hot. When cool, slowly rotate cap to the first stop and allow sufficient time for excess pressure to escape before removing the cap completely.
1. Stop the engine, remove the key and let it cool down.
2. To drain the coolant, open the radiator drain cock (2), and remove radiator cap (1). The radiator cap (1) must be removed to completely drain the coolant.
3. After all coolant is drained, close the drain cock (2).

**IMPORTANT**
- Do not start engine without coolant.
- Use clean, fresh water and anti-freeze to fill the radiator and recovery tank.
- When the anti-freeze is mixed with water, the anti-freeze mixing ratio must be less than 50%.
- Securely tighten radiator cap. If the cap is loose or improperly fitted, water may leak out and the engine could overheat.

Discharging R134a Refrigerant

Prepare for the R134a refrigerant recovery and recycling machine.

1. Connect low pressure side hose (blue) from the recovery and recycling machine to LO pressure side charging valve (1) on the compressor (3). Connect high pressure side hose (red) to HI pressure side charging valve (2) on the compressor (3).
2. Follow the manufacturers instructions and discharge the system.

■ IMPORTANT
- Use only R134a refrigerant recovery and recycling machine. Eliminate mixing R134a equipment, refrigerant, and refrigerant oils with R12 systems to prevent compressor damage.

⚠️ CAUTION
- Protect fingers with cloth against frostbite by refrigerant when disconnecting the hose to the charging valve.

Removing Battery

1. Removing the wing nut (4).
2. Remove the battery retainer (2).
3. Disconnect the battery negative cable (1) from the battery (5).
4. Disconnect the battery positive cable (3) from the battery (5).
5. Remove the battery (5).

(When reassembling)
- Connect the battery positive cable first.
- Connect the battery negative cable second.

Removing Receiver, Condenser and Refrigerant Hoses

1. Disconnect the high pressure pipe (3) and the low pressure pipe (2) from the compressor.
2. After removing the battery, disconnect the connector from the receiver pressure switch. Remove the bolts (8) and the receiver (10).
3. Remove the condenser (7).
4. Remove the refrigerant clamps (12) (13).
5. Dismount the receiver, the condenser with the refrigerant hose (1) not to bend or not to damage the refrigerant pipes connected to the receiver.

(When reassembling)

- Connect the battery positive cable first.
- Connect the battery negative cable second.

Disconnecting Water Hoses
1. Loosen the water drain cock (1).
2. Drain the coolant.
3. Remove the hose clamps (3). Disconnect the water hoses (2) from the engine.

(When reassembling)
- Fill the coolant to the specified capacity.

[3] DISASSEMBLING AND ASSEMBLING

(1) External Components

Fan, Water Hose, Fan Belt, Alternator, Muffler, Meter Cable, Air Cleaner, Air Cleaner Bracket, Inlet Hose, Air Conditioner, Compressor and etc.

1. Remove the external components as shown in the picture.

(When reassembling)

- Check to see that there are no crack on the fan belt surface.

■ IMPORTANT

- When installing the fan belt (6), be sure to adjust the fan belt tension.

<table>
<thead>
<tr>

(1) Pipe Clamp (2) Injection Pipe

**Nozzle Heat Seal Service Removal Procedure**

■ IMPORTANT
- Use a plus (phillips head) screw driver that has a Dia. which is bigger than the heat seal hole (Approx. 6 mm (1/4 in.)).
1. Drive screw driver lightly into the heat seal hole.
2. Turn screw driver three or four times each way.
3. While turning the screw driver, slowly pull the heat seal out together with the injection nozzle gasket.

If the heat seal drops, repeat the above procedure. Heat seal and injection nozzle gasket must be changed when the injection nozzle is removed for cleaning or for service

(1) Plus Screw Driver (2) Injection Nozzle (3) Injection Nozzle Packin (4) Heat Seal

KiSC issued 03, 2007 A
Rocker Arm and Push Rod
1. Remove the rocker arm bracket nut.
2. Detach the rocker arm assembly (1).
3. Remove the push rods (2).

(When reassembling)
- When putting the push rods (2) onto the tappets (3), check to see if their ends are properly engaged with the dimples.

■ IMPORTANT
- After installing the rocker arm, be sure to adjust the valve clearance.

<table>

Cylinder Head
1. Loosen the hose clamps (1), and remove the water return hose (2).
2. Remove the cylinder head screw in the order of (n or r) to (a).
3. Lift up the cylinder head to detach.
4. Remove the cylinder head gasket.

(When reassembling)
- Replace the cylinder head gasket with new one.
- When mounting the gasket, set it to the pin pipe holes. Take care not to mount it reversely.
- The cylinder head should be free of scratches and dust.
- Install the cylinder head, using care not to damage the gasket.
- After applying engine oil to the thread of screws, tighten them in several steps and specified sequence (a) to (n or r).

■ NOTE
- Do not use O-ring on the pin pipe.
- It is not necessary to retighten the cylinder head screw and to readjust valve clearance after engine warmed up.

<table>
<thead>

Tappets
1. Remove the tappets (1) from the crankcase.

(When reassembling)
- Visually check the contact between tappets and cams for proper rotation. If defect is found, replace tappets.
- Before installing the tappets, apply engine oil thinly around them.

■ IMPORTANT
- Do not change the combination of tappet and tappet guide.

(1) Tappet
Valves
1. Remove the valve caps (2).
2. Remove the valve spring collet (3), pushing the valve spring retainer (4) by valve spring replacer (1).
3. Remove the valve spring retainer (4), valve spring (5) and valve stem seal (6).
4. Remove the valve (7).

(When reassembling)
- Wash the valve stem seal and valve guide hole, and apply engine oil sufficiently.
- After installing the valve spring collets, lightly tap the stem to assure proper fit with a plastic hammer.

**IMPORTANT**
- Do not change the combination of valve and valve guide.

![Valve Diagram](image1)

Thermostat Assembly
1. Remove the thermostat cover mounting screws (1), and remove the thermostat cover (2).
2. Remove the thermostat assembly (4).

(When reassembling)
- Apply a liquid gasket (Three Bond 1215 or equivalent) only at the thermostat cover side of the gasket (3).

![Thermostat Assembly Diagram](image2)

**Gear Case**

Fan Drive Pulley
1. Secure the flywheel to keep it from turning.
2. Remove the fan drive pulley screw.
3. Draw out the fan drive pulley with a puller.

(When reassembling)
- Install the pulley (D1105) to the crankshaft, aligning the mark (1) on them.
- Apply engine oil to the fan drive pulley retaining screws. And tighten them.

![Fan Drive Pulley Diagram](image3)

<table>

</table>

(1) Alignment Mark
**Gear Case**

1. Remove the gear case (1).

(When reassembling)
- Grease thinly to the oil seal, and install it, ensuring the lip does not come off.
- Measure the length ($L$) when the gear case mounting bolt is inserted in the gear case bolt hole and judge the installation position of the mounting bolt when you do not understand the installation position of the mounting bolt.
  - $A : L = 18$ mm (0.71 in.) (Pipe Pin Position)
  - $B : L = 13$ mm (0.51 in.) (Water Pipe Mounting)
  - $C : L = 10$ mm (0.39 in.)
  - $D :$ Nut
  - $L :$ Length between the mounting bolt and the gear case surface

(1) Gear Case

---

**Engine Stop Solenoid and Speed Control Plate**

1. Remove the engine stop solenoid.
2. Disconnect the governor spring (2) from the speed control plate (1).
3. Remove the speed control plate.

(When reassembling)
- Apply a liquid gasket (Three Bond 1215 or equivalent) to both sides of the solenoid cover gasket and control plate gasket.
- Be careful not to drop the governor springs into the crankcase.

(1) Speed Control Plate  
(2) Governor Spring
**Injection Pump**

1. Disconnect the starter spring (4) on the thrust lever side (5).
2. Align the control rack pin (2) with the notch (1) on the crankcase, and remove the injection pump (3).
3. Remove the injection pump shims.
4. In principle, the injection pump should not be disassembled.

**When reassembling**
- When installing the injection pump, insert the control rack pin (2) firmly into the groove (6) of the thrust lever of fork lever.

**NOTE**
- The sealant is applied to both sides of the soft metal gasket shim. The liquid gasket is not required for assembling.
- Addition or reduction of shim (0.05 mm, 0.002 in.) delays or advances the injection timing by approx. 0.0087 rad (0.5 °).
- In disassembling and replacing, be sure to use the same number or new gasket shims with the same thickness.
Cam Gear, Idle Gear 1, 2 and Governor Gear
1. Remove the external snap ring (9), and then remove the idle gear 1 (10).
2. Remove the lock nut (1), and then remove the bearing nut (2) with a bearing nut finger socket (11).
3. Remove the idle gear 2 (5) with taper roller bearings.
4. Remove the fuel camshaft stopper (14).
5. Draw out the fuel cam gear (12) with fuel camshaft (15).
6. Remove the camshaft stopper bolt.
7. Remove the cam gear (7) with camshaft.
8. Remove the external snap ring (17) from the governor shaft (19).
9. Remove the governor gear (13) with governor shaft (19).

**NOTE**
- Three-lever type fork lever
  To remove the governor shaft, follow the procedures in 8, 9 above and never remove fork lever and the max torque limiter.

(When reassembling)
- Apply engine oil thinly to the fuel camshaft before installation.
- Make sure to assemble the external snap ring of the governor shaft.
- Check the governor shaft for smooth rotation.
- Tighten the idle gear 2 bearing nut and the idle gear lock nut to the specified tightening torque.

**IMPORTANT**
- When replacing the ball bearing of governor shaft, securely fit the ball bearing (18) to the crankcase, apply an adhesive (Three Bond 1324B or equivalent) to the set screw (20), and fasten the screw until its tapered part contacts the circumferential end of the ball bearing.
- When installing the idle gear 1, be sure to align the alignment marks on each gears.

Oil Pan and Oil Strainer
1. Remove the oil pan mounting screws (5).
2. Remove the oil pan (4).
3. Remove the oil strainer (3).

(When reassembling)
- After cleaning the oil strainer, check to see that the filter mesh is clean, and install it.
- Visually check the O-ring (1), apply engine oil, and install it.
- Securely fit the O-ring to the oil strain.
- To avoid uneven tightening, tighten oil pan mounting screws in diagonal order from the center.

IMPORTANT
- Scrape off the old adhesive completely. Wipe the sealing surface clean using waste cloth soaked with gasoline. Now apply new adhesive 3 to 5 mm (0.12 to 0.20 in.) thick all over the contact surface. Apply the adhesive also on the center of the flange as well as on the inner wall of each screw hole.
- Cut the nozzle of the "liquid gasket" container at its second notch. Apply "liquid gasket" about 5 mm (0.2 in.) thick. Within 20 minutes after the application of fluid sealant, reassemble the components. Wait then for about 30 minutes, and pour oil in the crankcase.

(4) Piston and Connecting Rod

1. Remove the connecting rod cap.

(When reassembling)
- Align the marks (a) with each other. (Face the marks toward the injection pump.).
- Apply engine oil to the connecting rod screws (1) and lightly screw it in by hand, then tighten it to the specified torque.
  - If the connecting rod screw won't be screwed in smoothly, clean the threads.
  - If the connecting rod screw (1) is still hard to screw in, replace it.

<table>
<thead>
<tr>

</table>

(1) Connecting Rod Screw   (a) Mark
Piston
1. Turn the flywheel and bring the piston to top dead center.
2. Draw out the piston upward by lightly tapping it from the bottom
   of the crankcase with the grip of a hammer.
3. Draw out the other piston in the same method as above.

(When reassembling)
- Before inserting the piston into the cylinder, apply enough engine
  oil to the piston.
- When inserting the piston into the cylinder, face the mark on the
  connecting rod to the injection pump.

**IMPORTANT**
- Do not change the combination of cylinder and piston. Make
  sure of the position of each piston by marking. For example,
  mark "1" on the No.1 piston.
- When installing the piston into the cylinder, place the gaps
  of all the piston rings as shown in the figure.
- Carefully insert the piston using a piston ring compressor
  (1). Otherwise, their chrome-plated section may be
  scratched, causing trouble inside the cylinder.

(1) Piston Ring Compressor
   (a) 0.785 rad (45°)
   (b) 0.785 rad (45°)
   (c) 1.57 rad (90°)

(B) Second Ring Gap
(C) Oil Ring Gap
(D) Piston Pin Hole
Piston Ring and Connecting Rod

1. Remove the piston rings using a piston ring tool.
2. Remove the piston pin (7), and separate the connecting rod (6) from the piston (5).

(When reassembling)
- When installing the ring, assemble the rings so that the manufacturer’s mark (12) near the gap faces the top of the piston.
- When installing the oil ring onto the piston, place the expander joint (10) on the opposite side of the oil ring gap (11).
- Apply engine oil to the piston pin.
- When installing the connecting rod to the piston, immerse the piston in 80 °C (176 °F) oil for 10 to 15 minutes and insert the piston pin to the piston.
- When installing the connecting rod to the piston, align the mark (8) on the connecting rod to the fan-shaped concave (9).

**NOTE**
- Mark the same number on the connecting rod and the piston so as not to change the combination.

![Diagram of Bearing Case Cover](image2)
Crankshaft Assembly
1. Remove the main bearing case screw 2 (1).
2. Pull out the crankshaft assembly.

**IMPORTANT**
- Take care to protect crankshaft bearing 1 from scratches, caused by the crank gear, etc. (Wrap the gear in vinyl tape, etc.).

(When reassembling)
- Clean the oil passage of the crankshaft with compressed air.
- Apply oil to the main bearing case screw 2 (1).
- Install the crankshaft assembly, aligning the screw hole of main bearing case with the screw hole of crankcase.
- Clean the oil passage of the crankshaft with compressed air.

<table>

</table>

(1) Main Bearing Case Screw 2

Main Bearing Case Assembly
1. Remove the two main bearing case screws 1 (3) of each main bearing cases.
2. Remove the main bearing case from crankshaft.

(When reassembling)
- Clean the oil passage in the main bearing cases.
- Apply clean engine oil on the bearings.
- Install the main bearing case assemblies in original positions. Since diameters of main bearing cases vary, install them in order to marking (c) (A, B, C) from the gear case side.
- Match the alignment numbers (a) on the main bearing case assembly 1.
- When installing the main bearing case 1 and 2, face the mark “FLYWHEEL” to the flywheel.
- Install the thrust bearing (2) with its oil groove facing outward.
- Confirm that the main bearing case moves smoothly after tightening the main bearing case screw 1 to the specified torque.

[4] SERVICING

(1) Cylinder Head and Valves

Top Clearance
1. Remove the cylinder head. (Do not attempt to remove the cylinder head gasket.)
2. Move the piston up and stick a strip of fuse [1.5 mm dia. (0.059 in. dia.), 5.0 to 7.0 mm long (0.20 to 0.27 in. long)] on the piston head at three positions with grease so as to avoid the intake valve and the exhaust valve and the combustion chamber ports.
3. Lower the piston, and install the cylinder head and tighten the cylinder head screws to the specified torque.
4. Turn the flywheel until the piston exceeds top dead center.
5. Remove the cylinder head, and measure the thickness of the squeezed fuses.
6. If the measurement is not within the factory specifications, check the oil clearance between the crankpin and the crankpin bearing and between the piston pin and the small end bushing.

**NOTE**
- After checking the top clearance, be sure to assemble the cylinder head with a new cylinder head gasket.

<table>

Cylinder Head Flaw
1. Prepare an air spray red check.
2. Clean the surface of the cylinder head with detergent (2).
3. Spray the cylinder head surface with the red permeative liquid (1). Leave it five to ten minutes after spraying.
4. Wash away the read permeative liquid on the cylinder head surface with the detergent (2).
5. Spray the cylinder head surface with white developer (3).
6. If flawed, it can be identified as red marks.

(1) Red Permeative Liquid (3) White Developer
(2) Detergent

Valve Recessing
1. Clean the cylinder head surface, the valve face and the valve seat.
2. Insert the valve into the valve guide.
3. Measure the valve recessing with a depth gauge.
4. If the measurement exceeds the allowable limit, replace the valve.
5. If it still exceeds the allowable limit after replacing the valve, replace the cylinder head.

<table>

Replacing Valve Guide

(When removing)
1. Press out the used valve guide using a valve guide replacing tool. (See page “SPECIAL TOOLS”.)

(When installing)
1. Clean a new valve guide and valve guide bore, and apply engine oil to them.
3. Ream precisely the I.D. of the valve guide to the specified dimension.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

(3) Incorrect
Correcting Valve and Valve Seat

- **NOTE**
  - Before correcting the valve and the seat, check the valve stem and the I.D. of valve guide section, and repair them if necessary.
  - After correcting the valve seat, be sure to check the valve recessing.

1) Correcting Valve

1. Correct the valve with a valve refacer.

2) Correcting Valve Seat

1. Slightly correct the seat surface with a 0.785 rad (45°) / 1.047 rad (60°) valve seat cutter.
2. Fitting the valve, check the contact position of the valve face and seat surface with prussian blue. (Visual check) [If the valve has been used for a long period, the seat tends to come in contact with the upper side of the valve face.]
3. Grind the upper surface of the seat with a 0.523 rad (30°) valve seat cutter until the valve seat touches to the center of the valve face (so that (a) equals (b) as shown in the figure).
4. Grind the seat with a 0.262 rad (15°) valve seat cutter again, and visually recheck the contact between the valve and the seat.
5. Repeat steps 3 and 4 until the correct contact is achieved.
6. Continue lapping until the seated rate becomes more than 70% of the total contact area.

(b) Valve Seat Width
(A) Check Contact
(B) Correct Seat Width
(C) Correct Seat Surface
(D) Check Contact

Valve Lapping

1. Apply compound evenly to the valve lapping surface.
2. Insert the valve into the valve guide. Lap the valve onto its seat with a valve flapper or screwdriver.
3. After lapping the valve, wash the compound away and apply oil, then repeat valve lapping with oil.
4. Apply prussian blue to the contact surface to check the seated rate. If it is less than 70%, repeat valve lapping again.

- **IMPORTANT**
  - When valve lapping is performed, be sure to check the valve recessing and adjust the valve clearance after assembling the valve.
Free Length and Tilt of Valve Spring

1. Measure the free length (B) of valve spring with vernier calipers. If the measurement is less than the allowable limit, replace it.
2. Put the valve spring on a surface plate, place a square on the side of the valve spring.
3. Check to see if the entire side is in contact with the square. Rotate the valve spring and measure the maximum tilt (A). If the measurement exceeds the allowable limit, replace it.
4. Check the entire surface of the valve spring for scratches. If there is any defect, replace it.

(2) Idle Gear and Camshaft

Timing Gear Backlash
1. Set a dial indicator (lever type) with its tip on the gear tooth.
2. Move the gear to measure the backlash, holding its mating gear.
3. If the backlash exceeds the allowable limit, check the oil clearance of the shafts and the gear.
4. If the oil clearance is proper, replace the gear.

| Backlash between idle gear 1 and crank gear | Factory spec. | 0.032 to 0.115 mm 0.0013 to 0.0045 in. |
| Allowable limit | 0.15 mm 0.0059 in. |

| Backlash between idle gear 1 and cam gear | Factory spec. | 0.036 to 0.114 mm 0.0014 to 0.0045 in. |
| Allowable limit | 0.15 mm 0.0059 in. |

| Backlash between idle gear 1 and injection pump gear | Factory spec. | 0.034 to 0.116 mm 0.0013 to 0.0046 in. |
| Allowable limit | 0.15 mm 0.0059 in. |

| Idle gear 1 and idle gear 2 | Factory spec. | 0.033 to 0.117 mm 0.0013 to 0.0046 in. |
| Allowable limit | 0.15 mm 0.0059 in. |

Idle Gear 1 and 2 Side Clearance
1. Set a dial indicator with its tip on the idle gear.
2. Measure the side clearance by moving the idle gear to the front and rear.
3. If the measurement exceeds the allowable limit, replace the idle gear collar.

| Idle gear 1 and 2 side clearance | Factory spec. | 0.20 to 0.51 mm 0.0079 to 0.0201 in. |
| Allowable limit | 0.8 mm 0.0315 in. |

Camshaft Side Clearance
1. Set a dial indicator with its tip on the camshaft.
2. Measure the side clearance by moving the cam gear to the front to rear.
3. If the measurement exceeds the allowable limit, replace the camshaft stopper.

| Camshaft side clearance | Factory spec. | 0.07 to 0.22 mm 0.0028 to 0.0087 in. |
| Allowable limit | 0.30 mm 0.0118 in. |
**Camshaft Alignment**

1. Support the camshaft with V blocks on the surface plate at both end journals.
2. Set a dial indicator with its tip on the intermediate journal.
3. Measure the camshaft alignment.
4. If the measurement exceeds the allowable limit, replace the camshaft.

<table>
<thead>
<tr>

Replacing Idle Gear Bushing

(When removing)
1. Press out the used idle gear bushing using an idle gear bushing replacing tool. (See page “SPECIAL TOOLS”.)

(When installing)
1. Clean a new idle gear bushing and idle gear bore, and apply engine oil to them.
2. Press in a new bushing using an idle gear bushing replacing tool, until it is flush with the end of the idle gear.

(A) When Removing
(B) When Installing
(3) Piston and Connecting Rod

**Piston Pin Bore I.D.**
1. Measure the piston pin bore I.D. in both the horizontal and vertical directions with a cylinder gauge.
2. If the measurement exceeds the allowable limit, replace the piston.

<table>
<thead>
<tr>
<th>Piston pin bore I.D.</th>

Replacing Crankshaft Bearing 1

(When removing)

1. Press out the used crankshaft bearing 1 using a crankshaft bearing 1 replacing tool. (See page “SPECIAL TOOLS”.)

(When installing)

1. Clean a new crankshaft bearing 1 and crankshaft journal bore, and apply engine oil to them.
2. Using a crankshaft bearing 1 replacing tool, press in a new bearing 1 (2) so that its seam (1) directs toward the exhaust manifold side. (See figure.)

Oil Clearance between Crankshaft Journal and Crankshaft Bearing 2 (Crankshaft Bearing 3)

1. Put a strip of plastigage on the center of the journal.
2. Install the bearing case and tighten the bearing case screws 1 to the specified torque, and remove the bearing case again.
3. Measure the amount of the flattening with the scale and get the oil clearance.
4. If the clearance exceeds the allowable limit, replace the crankshaft bearing 2 (1) and crankshaft bearing (3).
5. If the same size bearing is useless because of the crankshaft journal wear, replace it with an undersize one referring to the table and figure.

**NOTE**
* Be sure not to move the crankshaft while the bearing case screws are tightened.

| Oil clearance between crankshaft journal and crankshaft bearing 2 | Factory spec. | 0.034 to 0.095 mm 0.0013 to 0.0037 in. |
| Crankshaft journal O.D. (Intermediate) | Factory spec. | 47.934 to 47.950 mm 1.8872 to 1.8878 in. |
| Crankshaft bearing 2 I.D. | Factory spec. | 47.984 to 48.029 mm 1.8891 to 1.8909 in. |
| Oil clearance between crankshaft journal and crankshaft bearing 3 | Factory spec. | 0.034 to 0.098 mm 0.0013 to 0.0039 in. |
| Crankshaft journal O.D. (Flywheel side) | Factory spec. | 51.921 to 51.940 mm 2.0441 to 2.0449 in. |
| Crankshaft bearing 3 I.D. | Factory spec. | 51.974 to 52.019 mm 2.0462 to 2.0480 in. |

(Reference)
* Undersize dimensions of crankshaft journal

| Undersize | 0.2 mm 0.008 in. | 0.4 mm 0.016 in. |
| Dimension A | 2.3 to 2.7 mm radius 0.0906 to 0.1063 in. radius | 2.3 to 2.7 mm radius 0.0906 to 0.1063 in. radius |
| *Dimension B | 1.0 to 1.5 mm relief 0.0394 to 0.0591 in. relief | 1.0 to 1.5 mm relief 0.0394 to 0.0591 in. relief |
| Dimension C | 47.734 to 47.750 mm dia. 1.8793 to 1.8799 in. dia. | 47.534 to 47.550 mm dia. 1.8714 to 1.8720 in. dia. |
| Dimension D | 51.721 to 51.740 mm dia. 2.0362 to 2.0370 in. dia. | 51.521 to 51.540 mm dia. 2.0284 to 2.0291 in. dia. |

(0.8-S)
The crankshaft journal must be fine-finished to higher than ∇∇∇∇
*Holes to be de-burred and edges rounded with 1.0 to 1.5 mm (0.0394 to 0.0591 in.) relief.
(5) Cylinder

**Cylinder Wear**
1. Measure the I.D. of the cylinder at the six positions (see figure) with a cylinder gauge to find the maximum and minimum I.D.’s.
2. Get the difference (Maximum wear) between the maximum and the minimum I.D.’s.
3. If the wear exceeds the allowable limit, bore and hone to the oversize dimension. (Refer to “Correcting Cylinder”.)
4. Visually check the cylinder wall for scratches. If deep scratches are found, the cylinder should be bored. (Refer to “Correcting Cylinder”.)

KiSC issued 03, 2007 A
1. STRUCTURE

[1] MANUAL TRANSMISSION MODEL

Engine torque is transmitted to the pressure plate assembly (11) via the flywheel (1) which is connected to the engine crankshaft. Therefore, the clutch cover constantly runs with engine. The clutch disc (2) is located between the flywheel (1) and the pressure plate (4) of pressure plate assembly (11). Torque is transmitted to the clutch disc (2) by the pressure created by the diaphragm spring (5) installed in the pressure plate assembly (11). Then, the torque is transmitted to the transmission via the clutch shaft (10).

When the clutch pedal is depressed, the clutch release hub (9) and the clutch release bearing (8) move towards the flywheel and push the fingers of the diaphragm spring (5). This movement pulls the pressure plate (4) up and disengages the clutch.
[2] CLUTCH OPERATION

(1) Clutch “Engaged”

When the clutch pedal is not depressed, the clutch release bearing (8) and the fingers of the diaphragm spring (5) are not connected to each other. Accordingly, the pressure plate (4) is tightly passed against the flywheel (1) by the diaphragm spring (5).

As a result, rotation of the flywheel (1) is transmitted to the transmission through the clutch shaft (10) due to the frictional force among the flywheel (1), the clutch disc (2) and the pressure plate (4).

(2) Clutch “Disengaged”

When the clutch pedal is depressed, the clutch pedal rod is pulled to move the clutch rod (7). Then, the release fork (6) pushes the release hub (9) and release bearing (8) toward the flywheel. Simultaneously, the release bearing (6) pushes the diaphragm spring (5).

As the pressure plate (4) is pulled by the diaphragm spring (5), the frictional force among the flywheel (1), the clutch disc (2) and the pressure plate (4) disappears.

Therefore, rotation of the flywheel (1) is not transmitted to the clutch disc (2), and then the rotation of the clutch shaft (10) stops.

4. CHECKING, DISASSEMBLING AND SERVICING

[1] CHECKING AND ADJUSTING

Checking Clutch Pedal Free Travel

⚠️ CAUTION
- When checking, park the tractor on flat ground, apply the parking brake, stop the engine and remove the key.
1. Slightly depress the clutch pedal and measure stroke (A) at the top of pedal stroke.
2. If the measurement is not within the factory specifications, loosen the lock nut (2) and adjust the clutch pedal rod (1) length.
3. Retighten the lock nut (2).
4. After adjusting, release the clutch pedal and check the clearance (B). If adjustment is needed, adjust the clearance with the bolt (3).

<table>

[2] DISASSEMBLING AND ASSEMBLING

(1) Separating Engine From Clutch housing

Draining Transmission Fluid
1. Place oil pan underneath the transmission case, and remove the drain plugs (3).
2. Drain the transmission fluid.
3. Reinstall the drain plug (3).

(When refilling)
- Fill new oil from port after remaining the filling plug (2) up to the upper notch on the dipstick (1).
- After running the engine for new minutes, stop it and check the oil level again, if low, add oil prescribed level.

■ IMPORTANT
- Use only KUBOTA SUPER UDT fluid. Use of the other oils may damage the transmission or hydraulic system. Refer to "LUBRICANTS, FUEL AND COOLANT" (See page G-7.)
- Never work the tractor immediately after changing the transmission oil. Keeping the engine at medium speed for a few minutes to prevents damage to the transmission.
- Do not mix different brands oil together.

| Transmission fluid capacity | B1830, B2230, B2530 Manual transmission (without Bi-Speed Turn) | 15 L  
4.0 U.S.gals  
3.3 Imp.gals  
B1830, B2230, B2530 Manual transmission (with Bi-Speed Turn) | 16.5 L

Fuel
1. Disconnect the fuel hose (1) from the fuel filter (2).
2. Drain the fuel to the fuel tank completely.

(1) Fuel Hose (from Fuel Tank)    (2) Fuel Filter
Steering Wheel, Meter Panel, Shuttle Lever and Panel Lower Cover

1. Remove the steering wheel cap.
2. Remove the steering wheel mounting nut.
3. Remove the steering wheel with a steering wheel puller (Code No. 07916-51090).
4. Remove the accelerator lever grip (3) and the steering boot (2).
5. Disconnect the hour meter cable and wiring harness connectors.
6. Remove the meter panel (1) not to damage with the steering shaft (4).
7. Remove the shuttle lever (5).
8. Remove the panel lower cover (6).

(When reassembling)

- Tighten the steering wheel mounting nut securely.

Separating Engine with Front Axle

1. Reinstall the rear tires.
2. Support the transmission with a disassembling stand.
3. Hook the engine with a hoist.
4. Place the disassembling stand under the main frame.
5. Disconnect the power steering hoses (2).
6. Loose the hydraulic inlet hose band. Disconnect the hydraulic inlet hose (3) from the hydraulic pump. Disconnect the hydraulic delivery pipe (4) from the hydraulic pump.
7. Disconnect the wiring leads from the alternator (5), the engine oil pressure switch (6) and the starter motor (8). Disconnect the wiring harness (7) and the power steering hoses (9) from the engine body.
8. Remove the docking bolts between the engine and the front case.

(When reassembling)
- Align the spline between the front wheel drive shaft and the universal joint securely.
- Tighten the docking bolts between the engine and the front case securely.

(2) Separating Clutch Assembly

Separating the Clutch Assembly
1. Remove the clutch assembly (2) from the flywheel.

(When reassembling)
- Direct the shorter end of the clutch disc boss toward the flywheel.
- Apply molybdenum disulphide (Three Bond 1901 or equivalent) to the splines of clutch disc boss.
- Install the pressure plate, noting the position of straight pins.

■ IMPORTANT
- Align the center of clutch disc and flywheel by inserting the clutch center tool.

■ NOTE
- Do not allow grease and oil on the clutch disc facing.

[3] SERVICING

Backlash between Clutch Disc and Clutch Shaft
1. Mount the clutch disc onto the propeller shaft.
2. Hold the propeller shaft so that it does not rotate.
3. Slightly move the disc and measure the displacement around the disc edge.
4. If the measurement exceeds the allowable limit, replace the clutch disc.

<table>
<thead>
<tr>

Checking Pressure Plate and Diaphragm
1. Check the pressure plate and if scratched on its surface, correct with sandpaper or replace.
2. Check the diaphragm for crack and scratches. If defects are found, replace it.

Checking Clutch Release Bearing
1. Check the clutch release bearing. IF surface is worn excessively, or abnormal sounds occur, replace it.

(2) Front Mission Cover
(3) Bi-Speed Turn ON/OFF Shift Shaft
(4) Bi-Speed Turn Shift Shaft
(5) Bi-Speed Rod 2

A : Connected to the Left Bevel Gear Case

(2) Linkage : Bi-Speed Turn “Engaged”

When the Bi-Speed Turn lever is shifted to “ON” position, the Bi-Speed rod 1 (1) is pushed down and the Bi-Speed Turn ON/OFF shift shaft (2) is rotated counterclockwise. It is kept “ON”.

When steering the steering wheel to “Left” or “Right”, the Bi-Speed rod 2 connected to the left bevel gear case is pulled. The Bi-Speed Turn shift shaft (3) is rotated.

At this time, hydraulic oil from the pump port enter to the Bi-Speed clutch shaft through both the Bi-Speed Turn shift shaft (3) and the Bi-Speed ON/OFF shift shaft (2).

The Bi-Speed Turn is engaged.

(3) Linkage : Bi-Speed Turn “Disengaged”

When the Bi-Speed Turn lever is shifted to “OFF” position, the Bi-Speed rod 1 (1) is pushed up and the Bi-Speed Turn ON/OFF shift shaft (2) is rotated clockwise. It is kept “OFF”.

When steering the steering wheel to “Straight”, the Bi-Speed rod 2 connected to the left bevel gear case is not pulled. The Bi-Speed Turn shift shaft (3) is kept to “OFF” position.

At this time, hydraulic oil from the pump port does not enter to the Bi-Speed Turn ON/OFF shift shaft.

The Bi-Speed Turn is disengaged.

(1) Bi-Speed Rod 1  A : Connected to the Left Bevel Gear Case

(3) Bi-Speed Turn Valve 1
(4) Regulating Valve
(5) Power Steering Controller

P : From Pump Port

H : To HST
(2) Bi-Speed Turn “Engaged”

When a operator engage the Bi-Speed Turn lever to “ON” position and the front wheel steering angle is above approximately 0.714 rad (42°), the Bi-Speed Turn engages.

At the time, since both the Bi-Speed Turn valve 1 and the Bi-Speed Turn valve open, the pressured oil enter into the Bi-Speed Turn clutch shaft (8).

The pressured oil push the piston in the Bi-Speed Turn clutch, and the shifter (5) connected to the piston (6) slides into the Bi-Speed Turn clutch pack.

The shifter does not mesh to the 35T gear (2).

The power is transmitted from the front wheel drive shaft 1 (28T-28T) (3) through the 23T Bi-Speed Turn gear (7), the Bi-Speed Turn clutch pack, and the shifter (5) to the Bi-Speed Turn clutch shaft (8), and to the 30T gear (1) and to the front drive shaft 3 (24T) (9).

(3) Bi-Speed Turn “Disengaged”

When the front wheel steering angle is below 0.714 rad (42°), the Bi-Speed Turn is disengaged.

Since the pressurized oil is not delivered into the Bi-Speed Turn clutch pack, the shifter is pushed out to the 35T gear (2).

The shifter meshes to the 35T gear (2).

The power is transmitted as follows.

Front wheel drive shaft (28T-28T) (3) → 35T gear (2) → shifter (5) → Bi-Speed Turn clutch shaft (8) → 30T gear (1) → front drive shaft (24T) (9).
3. MANUAL TRANSMISSION

[1] STRUCTURE

(1) Main Gear Shift Section

Main shift section consists of three speeds.

■ 1st Speed Gear
The 23T F2 gear (shifter) (3) slides to the engine side.
The 23T F2 gear (shifter) (3) meshes to the 13T F1 gear (2).
The power is transmitted as follows.
First shift shaft (1) → 23T F2 gear (shifter) (3) → 13T F1 gear (2) → 30T F1 gear (7) → 15T-32T-26T-13T shaft (5).

■ 2nd Speed Gear
The 23T F2 gear (shifter) (3) meshes to the 32T gear (9) of the 15T-32T-26T-13T shaft (5).
The power is transmitted as follows.
First shift shaft (1) → 23T F2 gear (shifter) (3) → 32T gear (9) / 15T-32T-26T-13T shaft (5).

■ 3rd Speed Gear
The 23T F2 gear (shifter) (3) slides to the mechanical PTO clutch side.
The 23T F2 gear (shifter) (3) meshes to the 29T F3 gear (4).
The power is transmitted as follows.
First shift shaft (1) → 23T F2 gear (shifter) (3) → 29T F3 gear (4) → 26T gear (10) / 15T-32T-26T-13T shaft (5).

(1) First Shift Shaft (2) 13T F1 Gear (3) 23T F2 Gear (Shifter) (4) 29T F3 Gear (5) 15T-32T-26T-13T Shaft (6) 15T Gear (7) 30T F1 Gear (8) Shuttle Shaft (9) 32T Gear (10) 26T Gear
(2) Shuttle Gear Shift Section

The power shifted in the main gear shift section is transmitted from the 15T-32T-26T-13T shaft (2) to the shuttle shaft (3).

The shuttle shift gears are the sliding mesh gears. The reverse shaft is the front wheel drive shaft (8). The 27T gear (9) on the front wheel drive gear (8) is a reverse gear.

- **Forward**
  
  When shifting the shuttle lever to “Forward”, the shifter (5) slides to the 28T gear side.
  
  The shifter (5) meshes to the 28T gear (4).
  
  The power is transmitted as follows.
  15T-32T-26T-13T shaft (2) / 15T gear (2) → 28T gear (4) → shifter (5) → shuttle shaft → Hi-Low range gear section.

- **Reverse**
  
  When shifting the shuttle lever to “Reverse”, the shifter (5) slides to the 24T gear side.
  
  The shifter is transmitted as follows.
  15T-32T-26T-13T shaft (2) / 13T gear (7) → 27T gear (9) on the front wheel drive shaft (8) → 24T gear (6) → shifter (5) → shuttle shaft (3) → High-low range gear section.

(2) Piston  (10) Cylinder Block (Pump)
(3) Thrust Collar  (11) Charge Relief Valve
(4) Motor Shaft  (12) Needle Bearing
(5) Retainer Plate  (13) Valve Plate
(6) Thrust Collar  (14) Check and High Pressure
(7) Pump Shaft  Relief Valve
(8) Variable Swashplate  (15) Neutral Valve

KiSC issued 03, 2007 A
Pump and motor cylinder, each containing pistons, are connected by lines. Cylinders and lines are filled with oil piston ride against swashplates located in pump and motor.

In the pump, as the cylinder rotates, pistons move across the sloping face of swashplate and slide in or out of their cylinder bores. The oil forced out by the pump pistons, causes the motor pistons to slide out of their cylinder bores.

In the motor, sliding out of the cylinder and moving across the sloping face of swashplate, the pistons rotate the cylinder.

(15) Oil Tank
(16) Hydraulic Pump (for 3-points Hitch)
(17) Hydraulic Control Valve
(18) Oil Filter Cartridge

KiSC issued 03, 2007 A
The pump and the motor are joined in a closed hydraulic circuit. Most of oil circulates within the main oil circuit. A little oil lubricates and oozes out from the clearance between the moving parts in the case. Then oil in the main oil circuit of the HST needs to be supplied a want.

So all of oil fed from hydraulic pump flow to hydraulic transmission for charging and cooling.

The charge oil aids smooth operation of pistons for pump and motor. The charge oil passed to charge relief valve port. The rest of oil passed through the charge relief valve into the HST housing. And overflow oil from HST housing return to the transmission case.

a: High Pressure Oil
b: Low Pressure Oil
c: Free Oil
d: Suction Oil
When the speed control pedal is in "Neutral", the variable swashplate is right-angles to the pump pistons. And the pump pistons only rotate with cylinder block (pump) without reciprocating.

Since the oil is not being pumped to the motor, the cylinder block (motor) is stationary. And the output shaft does not rotate.

D: Pump D Port
a: High Pressure Oil
b: Low Pressure Oil
c: Free Oil
d: Suction Oil
When the speed control pedal is stepped on and set to "Forward", the variable swashplate is tilted as shown in figure above.

As the pump cylinder block rotates with the input shaft, oil is forced out of pump port A at high pressure. As pressure oil from the pump cylinder block enters to motor port C, the pistons, which align with port C, are pushed against the swashplate and slide down the inclined surface.

Then the output shaft rotates with the motor cylinder block. This drives the machine forward and the angle of pump swashplate determines the output speed.

As the motor cylinder block continues to rotate, oil is forced out of motor port D at low pressure and returns to the pump port B.
■ Reverse

(18) Oil Filter Cartridge

A : Pump A Port
B : Pump B Port
C : Pump C Port
D : Pump D Port
a : High Pressure Oil
b : Low Pressure Oil
c : Free Oil
d : Suction Oil
When the speed control pedal is stepped on and set to "Reverse", the variable swashplate is tilted as shown in figure above.

As the pump cylinder block rotates with the input shaft, oil is forced out of pump port B at high pressure. As pressure oil from the pump cylinder block enters to motor port D, the pistons, which align with port D, are pushed against the swashplate and slide down the inclined surface.

Then the output shaft rotates with the motor cylinder block. This drives the machine reward and the angle of pump swashplate determines the output speed.

As the motor cylinder block continues to rotate, oil is forced out of motor port C at low pressure and returns to the pump port A.
The HST pedal (5) and the trunnion shaft (4) of the variable swashplate are linked with the speed control rod (7) and the neutral holder (3). As the front footrest of the HST pedal (5) is depressed, the swashplate rotates and forward travelling speed increases. Depressing the rear footrest increases reverse travelling speed.

The roller (2) on the neutral holder arm (1) is held with spring seats and the detent of the neutral holder (3) so that the neutral holder (3) returns to neutral. When the pedal is released, the swashplate is returned to neutral with the neutral holder (3). The damper (8) connected to the HST pedal (5) restricts the movement of the linkage to prevent abrupt operation or reversing.

(1) Neutral Arm
(2) Roller
(3) Neutral Holder
(4) Trunnion Shaft
(5) HST Pedal
(6) Spring
(7) Speed Control Rod (HST)
(8) Damper
5. CRUISE CONTROL

[1] CRUISE CONTROL LINKAGE

(1) Cruise Control “ON” Position

When depressing the HST pedal (8) to “Forward”, the HST lever (14), the cruise rod (12) and the cruise lock 2 (10) moves like the arrow shown in the pictures.

And when the cruise control lever (2) is set to the desired position, the cruise lock (1) is locked to the cruise lock 2 (10) and the travelling speed is held to the desired speed.
(2) Cruise Control “OFF” Position

When depressing the brake pedals (9), the release rod (4), the cruise control lever (2) and the cruise lock 1 (3) moves like the arrows shown in the pictures.

And the cruise lock 1 release from the cruise lock 2 (10).

Cruise lock is changed from “ON” to “OFF” position.

Since the cruise lock is kept “OFF”, the neutral holder turns counterclockwise, and the roller is returned to “Neutral” position. The HST pedal (8) also returns to “Neutral” position and the tractor stops.
6. RANGE GEAR SHIFT SECTION

Range gear shift lever (1) is located at left side fender.
Range gear shift lever (1) can select three speed range, low speed, mid speed and high speed.
Range gear shift lever (1) and 18T shifter gear (10) are linked with range shift arm (3) and range shift fork (2) etc..

Three range gear shifts are selected by shifting the 18T shifter gear (10) on the sub shaft (8) to 17T gear (6) and 25T - 31T gear (7) on 6T bevel pinion shaft (4)

- **Low Speed Position**
  Sub shaft (8) → 18T shifter gear (10) → 12T gear (11) → 31T of 25T - 31T gear (7) → 6T bevel pinion shaft (4).

- **Middle Speed Position**
  Sub shaft (8) → 18T shifter gear (10) → 25T of 25T - 31T gear (7) → 6T bevel pinion shaft (4).

- **High Speed Position**
  Sub shaft (8) → 18T shifter gear (10) → 26T gear (9) → 17T gear (6) → 6T bevel pinion shaft (4).

H : “HIGH” Range

KiSC issued 03, 2007 A
7. FRONT WHEEL DRIVE SECTION

Front wheel drive lever (1) is located at the front floor cover.

Front wheel drive lever (1) and shifter (3) are linked. 20T shifter gear (5) is located on the front wheel drive shifter (4).

2-wheel drive or 4-wheel drive is selected by changing the position of 20T shifter gear (5) reverse or forward.

When the front wheel drive lever (1) is set to "4 Wheel Drive Position", 20T shifter gear (5) slides forward, meshes the 13T gear (6) on the 6T bevel pinion shaft (9).

In this state, power from the 6T bevel pinion shaft (9) is transmitted through 20T shifter gear (5) to the front wheel drive shaft (4) and the front wheels.

8. PTO SYSTEM (HYDRAULIC PTO CLUTCH MODEL)

[1] STRUCTURE

The PTO shift lever (1) is located at left side fender. The PTO shift lever (1) and the PTO shift arm (2) are linked with the control rod (5). The PTO shift arm (2) and the rear PTO arm (3) are linked with the rear PTO control plate.

The PTO shift arm (2) shifts the PTO shifter (8). The rear PTO arm (3) shifts the rear PTO shifter (12). PTO gear section consists of four sections. The first section is independent PTO section. The second section is PTO position selection section. The third section is mid-PTO selection section. The fourth section is rear PTO rotation prevention section.

In this section, when the PTO shift lever is set to "Mid-PTO" position, the shifter slides to the front side and shifter meshes to the housing. The rear PTO shift does not rotate at this "Mid-PTO" position.

R : REAR PTO position
R/M : REAR PTO / MID PTO position
M : MID PTO Position
When the PTO shift lever (1) is set to "REAR PTO" (R) position, the PTO shift lever (1) pushes the control rod (5).

The control rod (5) pushes the PTO shift arm (2). In this state, the PTO shift arm (2) shifts the PTO shifter (7) forward. The inner spline (10) of the PTO shifter (7) meshes the independent PTO shaft spline (9).

Power is transmitted from the independent PTO clutch to the rear PTO shaft as follows.

Independent PTO clutch → PTO shifter (7) → Independent PTO shaft (6) → Rear PTO shifter → Rear PTO shaft.

(1) PTO Shift Lever  (10) Inner Spline
(2) PTO Shift Arm         R/M : REAR PTO / MID PTO position
(3) Rear PTO Arm         R : REAR PTO position
(4) Rear PTO Control Plate
(5) Control Rod         M : MID PTO Position
(6) Independent PTO Shaft
(7) PTO Shifter         B : To Rear PTO Shaft
(8) PTO Shifter
(9) 25T Mid PTO Gear
(11) 25T Mid Gear Spline
When the PTO shift lever (1) is set to "REAR PTO / MID PTO" (R/M) position, the PTO shift lever (1) pulls the control rod.

The control rod (5) pulls the PTO shift arm (2).

In this state, the PTO shifter (7) keeps its position between the independent PTO shaft spline (9) and the 25T mid gear spline (11).

In this position, the inner spline (10) of the PTO shifter (7) meshes both independent PTO shaft spline (9) and the 25T and gear spline (11).

Power is transmitted from the independent PTO clutch to both the rear PTO shaft and the mid PTO shaft as follows.

**Rear PTO Section**

Independent PTO Clutch → PTO shifter (7) → Independent PTO Shaft (6) → Rear PTO shifter → Rear PTO shaft.

**Mid PTO Section**

Independent PTO Clutch → PTO shifter (7) → 25T mid gear → 26T gear on front wheel drive shaft → 17T - 26T mid gear → 30T gear → Mid PTO shaft (B1830, B2230, B2530: 18T, B3030: 17T).

</table>
When the PTO shift lever (1) is set to "MID-PTO" (M) position, the PTO shift lever pulls the control rod (5). The control rod (5) pulls the PTO shift arm (2). In this state, the PTO shift arm (2) shifts the PTO shifter (7) reverse. The inner spline of the PTO shifter (7) meshes the 25T Mid PTO gear spline (11).

On the other hand, the range gear shifter arm (2) turns the rear PTO control plate counterclockwise and turns the rear PTO arm counterclockwise.

Since the rear PTO arm is turned counter clockwise, the rear PTO shifter is pushed forward.

Then, the rear PTO shifter meshes the rib of the transmission case.

In this state, the rear PTO brake shifter prevents the independent PTO shaft from rotating itself.

(To be continued)
(Continued)

Power is transmitted from the independent PTO clutch to the Mid PTO shaft as follows.

Independent PTO clutch → PTO shifter (7) → 25T mid gear (8) → 26T gear (12) → 17T - 26T mid gear (14) → 30T gear (15) → Mid PTO shaft (16)

9. PTO SYSTEM (MECHANICAL PTO CLUTCH MODEL)

[1] STRUCTURE

The PTO shift lever location is almost same as the hydraulic PTO clutch model. The PTO positions are selected to three positions, the “Rear PTO” position (R), the “Rear PTO/ the mid-PTO” position (R/M) and the “Mid-PTO” position (M).

The PTO section is separated to two sections. The front PTO section is located in the main speed shift case. The rear PTO is the mechanism PTO assembly and is located in the transmission case.

The shifter (17) is connected mechanically to the PTO select lever.

When the mechanical PTO clutch lever is shifted to “ON (Engaged)” position, the mechanical PTO clutch lever (?) sides front and meshes to the one-way clutch spline boss (21).

Since the PTO brake spline boss (12), the power is transmitted from the one-way clutch spline boss through the shifter (10) to the PTO brake spline boss (12).

[PTO Brakes]

When the mechanical PTO clutch lever is shifted to “OFF (Disengaged)” position, the shifter (10) slides to the PTO brake spring side.

The shifter (7) does not mesh to the one-way clutch spline boss (9), and the power is not transmitted from the one-way clutch spline boss (9) to the PTO brake spline boss (12).

Since the PTO brake spring (11) pushed the brake prates (16) and the PTO brake disks (15), the PTO brake (13) is engaged at this moment.
When the PTO shift lever is set to “Rear PTO” position (R), the PTO shifter (6) slides to “Rear PTO” position (R).

The PTO shifter (6) meshes to the spline of the PTO clutch shaft (8).

The power is transmitted from the first shift shaft (1) to the PTO clutch shaft (8) as follows.

First shift shaft (1) → One-way clutch cam (2) → One-way clutch spline boss (3) → shifter (PTO ON/OFF) (4) → PTO brake spline boss (5) → PTO shifter (6) → PTO clutch shaft (8).

When the PTO shift lever is set to “Rear PTO/Mid-PTO” position, the PTO shifter (6) slides to “Rear PTO/Mid-PTO” position (R/M).

The PTO shifter (6) meshes to both the spline of the PTO clutch shaft (8) and the spline of the 25T mid-PTO gear (7).

The power is transmitted from the first shift shaft (1) to both the rear PTO and the mid-PTO as follows.

**To Rear PTO**

First shift shaft (1) → One-way clutch cam (2) → One-way clutch spline boss (3) → shifter (PTO ON/OFF) (4) → PTO brake spline boss (5) → PTO shifter (6) → PTO clutch shaft (8) → to rear PTO (R).

**To Mid PTO**

First shift shaft (1) → One-way clutch cam (2) → One-way clutch spline boss (3) → shifter (PTO ON/OFF) (4) → PTO brake spline boss (5) → PTO shifter (6) → 25T mid-gear (7) → 26T gear (10) → to mid-PTO (MP).
When the PTO shift lever is set to "Mid-PTO" position, the PTO shifter (6) slides to "Mid-PTO" position (M).

The PTO shifter meshes to the spline of the 25T mid-gear (7).

The power is transmitted from the first shift shaft (1) to the mid-PTO as shown in the figure.

(11) Mid Gear Shaft

R/M : REAR PTO / MID PTO
M : MID-PTO Position
E : Power from Engine
MP : Power to Mid-PTO Implement
[5] ONE-WAY CLUTCH SYSTEM

In manual transmission models, a mechanical PTO is adopted.

The one-way PTO clutch is located between the first shift shaft (1) and the PTO clutch shaft (18).

The one-way clutch is composed of the first shift shaft (1), the one-way clutch spring (4), the one-way clutch cam (5), the one-way clutch spline boss (9) and the one-way clutch shaft (18).

The one-way clutch cam (15) is splined to the first shift shaft (1), and the one-way clutch spline boss (9) is splined to the PTO clutch shaft (18).

Both the one-way clutch cam (5) and the one-way clutch spline boss (9) are engaged with each other by the force of the one-way clutch spring (4).

While the first shift shaft (1) is driving the PTO clutch shaft (18), both the one-way clutch cam and the one-way clutch spline boss (9) will remain engaged.

However, when the PTO shaft drives a rotary mower, for example, and if the engine speed is lowered, the one-way clutch spline boss (9) on the PTO clutch shaft (18) will overrun.

This overrunning is caused by the internal of the mower’s blades.

Then, engagement will not take place until the first shift shaft (1) is running faster than the one-way clutch PTO clutch shaft (18).

In this way, the one-way clutch protects the transmission and the engine against damage, by allowing the PTO shaft, the first shift shaft (1) and the PTO clutch shaft (18) to overrun if the first shift shaft (1) over speeds.

a : One-way Clutch Section
10. DIFFERENTIAL GEAR SYSTEM

[1] DIFFERENTIAL FUNCTION

■ During Straight Running

Rotation of the spiral bevel pinion (1) is transmitted to the spiral bevel gear (4) and differential case (8). When road resistance to the right and left wheels are equal, differential pinions (2), (6) and differential side gears (3), (7) are all rotate as a unit. Both rear axles received equal input, and both wheels turn at the same speed, allowing the tractor to ho straight ahead. At this time, differential pinions (2), (6) does not rotate around the differential pinion shaft (5).

■ During Turning

When the tractor turns, the road resistance to the inside tire increases (as if braking is applied to that side only). In other words, if one of tires slows down, revolution difference is generated in the differential side gears (3), (7). When rotation of one differential side gear becomes lower than the other, differential pinions (2), (6) begin rotating around differential pinion shaft (5). The other differential side gear is increased in speed by the speed increment of differential pinion shaft (5). This means that rotation of one rear axle is slowed down and that of the other rear axle is increased. Thus, the tractor turns smoothly without power loss.

The combined number of revolutions of the right and left differential side gears is always twice that of the spiral bevel gear (4). When spiral bevel gear revolution is 100 min\(^{-1}\) (rpm), and if one of the differential side gears stops moving, the revolution of the other differential side gear becomes 200 min\(^{-1}\) (rpm) and if one rotates at 50 min\(^{-1}\) (rpm), the other rotates at 150 min\(^{-1}\) (rpm).
When resistance to the right and the left tires are greatly different due to ground conditions or type of work, the tire with less resistance slips and prevents the tractor from moving ahead. To compensate for this drawback, the differential lock restricts the differential action and causes both rear axles to rotate as a unit.

When the differential lock pedal is stepped on, it causes the differential lock lever (3) to rotate. The differential lock lever (3) will move the shift fork (2) and the differential lock clutch (5) toward the spiral bevel gear (8). The differential lock clutch (5) engages with the teeth of the differential case (6) to make the differential case (6) and the differential lock clutch (5) to rotate together as a unit.

Therefore, the differential pinions (1) are unable to rotate around the differential pinion shaft (7) and differential revolutions are transmitted to the right and the left differential gear shaft (4) (9).

4. CHECKING, DISASSEMBLING AND SERVICING

[1] CHECKING AND ADJUSTING

(1) Bi-Speed Turn

Charge Pressure

⚠️ CAUTION

- When checking, park the tractor on flat ground and fully engage the parking brake.

1. Remove the plug (R 1/8) (1) at the front case right side. (3 cylinder engine model)
2. Remove the plug (GPF 3/8) (4) at the front case bottom side. (4 cylinder engine model).
3. Install the adaptor to the front case.
4. Install the cable low pressure gauge to the adaptor.
5. Start the engine and warm the transmission fluid before testing.
6. Steer the steering wheel and turn the front wheel above 0.714 rad (42 °).
7. Read the low pressure gauge to measure the charge pressure.
8. If the measurement is not same as factory specification check the Bi-Speed Turn charge valve and the related hydraulic components.

### High Pressure Relief Valve Pressure (Reverse)

**CAUTION**
- When checking, park the tractor on flat ground and fully engage the parking brake.

1. Remove the lowering speed adjusting knob and the seat under cover.
2. Remove the plug from P1 port (reverse).

**NOTE**
- If the plug is tight to remove, warm up the plug by a hair dryer etc.

3. Install the adaptor (4) to P1 port (1).
4. Install the cable (3) and high pressure gauge.

5. Start the engine and warm the oil before testing. Check to see that parking brake is applied.
6. Place the range gear shift lever (5) to "HIGH" position.
7. Run the engine at the rated speed.
8. Depress the rear side pedal of the HST pedal (6).
9. Read the high pressure gauge to measure the high pressure relief valve pressure.
10. If the measurement is not the same as factory specification, check the check and high pressure relief valve assembly.

**IMPORTANT**
- Measure quickly so than the relief valve may not be in operation more than 10 seconds.

**NOTE**
- High pressure gauge is 40 MPa (400 kgf/cm², 5800 psi) full scale.
- Engine speed : Rated speed
- Oil temperature : 45 to 55 °C  113 to 131 °C

**Factory spec.**
- 33.9 to 34.8 MPa
- 345 to 355 kgf/cm²
- 4910 to 5040 psi

KiSC issued 03, 2007 A
**High Pressure Relief Valve Pressure (Forward)**

**CAUTION**

- When checking, park the tractor on flat ground and fully engage the parking brake.

1. Remove the lowering speed adjusting knob and the seat under cover.
2. Remove the plug from P2 port (forward).

**NOTE**

- If the plug is tight to remove, warm up the plug by a hair drier etc..
3. Install the adaptor (4) to P2 port (1).
4. Install the cable (3) and high pressure gauge.

1. Start the engine and warm the oil before testing. Check to see that parking brake is applied.
2. Place the range gear shift lever (5) to “HIGH” position.
3. Run the engine at the rated speed.
4. Depress the front side pedal of the HST pedal (6).
5. Read the high pressure gauge to measure the high pressure relief valve pressure.
6. If the measurement is not same as factory specification, check the check and high pressure relief valve assembly.

**IMPORTANT**

- Measure quickly so that the relief valve may not be in operation more than 10 seconds.

**NOTE**

- High pressure gauge is 40 MPa (400 kgf/cm², 5800 psi) full scale.
- Engine speed : Rated speed
- Oil temperature : 45 to 55 °C
  113 to 131 °F

**(When reassembling)**

- Apply liquid lock (Three Bond 1375N or its equivalent) to the plug.
Readjustment of Relief Valve (When the HST does not work due to its loose hexagon socket head screw)

IMPORTANT
- The KUBOTA does not recommend the readjustment of relief valve. And KUBOTA will recommend to replace with genuine parts.
- As the HST may be damaged if the pressure is set to higher by mistake, be careful when adjusting it.

NOTE
- The relief pressure is set in between 33.3 to 36.3 MPa (340 to 370 kgf/cm², 4836 to 5262 psi) when shipped from the factory. But, for the purpose of after-sales services, as it is impossible to reset the pressure precisely as set in the factory, its setting range is defined as a slightly wider range between 31.4 to 35.3 MPa (320 to 360 kgf/cm², 4551 to 5120 psi)

1. Measure the pre-adjustment distance A.
2. Compress the spring of the relief valve with a relief valve assembling tool (3).
3. Then, find the distance A by turning the poppet (4) with a screwdriver.
   Reference: The distance A changes by about 0.5 mm (0.0197 in.) per one turn of the poppet (4).
4. Repeat the same operation a few times to find the distance A as it is difficult to acquire at the first time.
5. After finding the distance A, hold the setscrew (6) to a vice and fasten the hexagon socket head screw (2) with specified torque. On this occasion, use a copper plate, etc. for the vice jaws not to damage the setscrew (6).
6. Install the relief valve in the HST.
7. Check the relief pressure as indicated in page 3-S7 and 3-S8. The distance A is for refresh only. Make sure to check the relief pressure after readjustment.
8. If the relief pressure does not fall within the readjustment pressure range, repeat the processes of the above item 1 onward.

Reference: The pressure changes by 1.47 MPa (15 kgf/cm², 213.3 psi) per 0.1 mm (0.0039 in.) in distance A.

W1034685
(3) Cruise Control

Cruise Control Adjustment

1. Before adjusting the cruise control adjustment, adjust the brake pedal free travel (2) securely.

<table>
<thead>
<tr>
<th>Brake pedal free travel (A)</th>
<th>30 to 40 mm (1.18 to 1.57 in.) on the pedal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Keep the free travel in the right and the left brake pedals equal.</td>
<td></td>
</tr>
</tbody>
</table>

Check the cruise control is operated properly as follows.

- The cruise control lever is returned to “OFF” position (C) when depressing two brake pedals simultaneously.
- The cruise control lever is still kept at “ON” position (B) when depressing one side brake pedal.

If the cruise control is not operated properly as two conditions mentioned above, adjust the cruise control as follows.

2. Depress the speed control pedal fully, and set the cruise control lever to “ON” position (B).

3. Remove the rear wheel (RH).

Case 1: When the cruise control lever is not returned to “OFF” position (C) properly by depressing both brake pedals, after connecting both the left and the right brake pedals.

- Shorten the release rod (6) until the cruise control is returned to “OFF” position (C).

Case 2: When the cruise control lever is not kept at “ON” position (B) by depressing the one side brake pedal after disconnecting the brake pedal lock (7) from the right brake pedal.

- Lengthen the release rod (6) until the cruise control is kept at “ON” position (C).

Remarks

- Since the cruise control adjustment range is very narrow, the release rod length is shown as a reference below.

<table>
<thead>
<tr>

[2] PREPARATION

(1) Draining Lubricants and Coolant

Draining Engine Oil

\textbf{CAUTION}

- Before changing oil, be sure to stop the engine.
- Start and warm up the engine for approx. 5 minutes.
- Place an oil pan underneath the engine.
- To drain the used oil, remove the drain plug (1) at the bottom of the engine and drain the oil completely.
- Screw in the drain plug (1).
- Fill new oil up to upper line on the dipstick (2).

\textbf{IMPORTANT}

- When using an oil of different manufacture or viscosity from the previous one, remove all of the old oil.
- Never mix two different types of oil.
- Use the proper SAE Engine Oil according to ambient temperatures.
- Refer to "LUBRICANTS, FUEL AND COOLANT". (See page G-7.)

Draining Transmission Fluid

**CAUTION**
- Stop the engine before checking and changing the transmission fluid.

1. Place the oil pan under the tractor.
2. Remove the drain plugs (1) (3) (5) at the mid-PTO shaft and at the bottom of the rear axle cases (4) (6).
3. Drain the transmission fluid.
4. After draining the transmission fluid, reinstall the drain plugs (1), (3), (5).

**IMPORTANT**
- Use only KUBOTA UDT oil. Use of other oils may damage the transmission or hydraulic system. Refer to "LUBRICANTS, FUEL AND COOLANT" (See page G-7).
- Never work the tractor immediately after changing the transmission oil. Keep the engine at medium speed for a few minutes to prevent damage to the transmission.
- Do not mix different brands oil together.

Draining Coolant

**CAUTION**
- Do not remove radiator cap while coolant is hot. When cool, slowly rotate cap to the first stop and allow sufficient time for excess pressure to escape before removing the cap completely.

1. Stop the engine, remove the key and let it cool down.
2. To drain the coolant, open the radiator drain cock (2), and remove radiator cap (1). The radiator cap (1) must be removed to completely drain the coolant.
3. After all coolant is drained, close the drain cock (2).

**IMPORTANT**
- Do not start engine without coolant.
- Use clean, fresh water and anti-freeze to fill the radiator and recovery tank.
- When the anti-freeze is mixed with water, the anti-freeze mixing ratio must be less than 50%.
- Securely tighten radiator cap. If the cap is loose or improperly fitted, water may leak out and the engine could overheat.

Discharging R134a Refrigerant

Prepare for the R134a refrigerant recovery and recycling machine.
1. Connect low pressure side hose (blue) from the recovery and recycling machine to LO pressure side charging valve (1) on the compressor (3). Connect high pressure side hose (red) to HI pressure side charging valve (2) on the compressor (3).
2. Follow the manufacturers instructions and discharge the system.

IMPORTANT
- Use only R134a refrigerant recovery and recycling machine.
- Eliminate mixing R134a equipment, refrigerant, and refrigerant oils with R12 systems to prevent compressor damage.

CAUTION
- Protect fingers with cloth against frostbite by refrigerant when disconnecting the hose to the charging valve.

Removing Battery
1. Removing the wing nut (4).
2. Remove the battery retainer (2).
3. Disconnect the battery negative cable (1) from the battery (5).
4. Disconnect the battery positive cable (3) from the battery (5).
5. Remove the battery (5).

(When reassembling)
- Connect the battery positive cable first.
- Connect the battery negative cable second.

4. Remove the steering post assembly (3).

(1) Center Pillar  (2) Fuel Tank  (3) Steering Post Assembly

Draining Transmission Fluid

⚠️ CAUTION
• Stop the engine before checking and changing the transmission fluid.
1. Place the oil pan under the tractor.
2. Remove the drain plugs (1) (3) (5) at the mid-PTO shaft and at the bottom of the rear axle cases (4) (6).
3. Drain the transmission fluid.
4. After draining the transmission fluid, reinstall the drain plugs (1), (3), (5).

■ IMPORTANT
• Use only KUBOTA UDT oil. Use of other oils may damage the transmission or hydraulic system. Refer to "LUBRICANTS, FUEL AND COOLANT" (See page G-7).
• Never work the tractor immediately after changing the transmission oil. Keep the engine at medium speed for a few minutes to prevents damage to the transmission.
• Do not mix different brands oil together.

Steps, Brake Rods, Hydraulic Pipes, Sub-Frames and Wiring Harness

1. Remove the steps (1) and the brake springs.
2. Disconnect the connectors from the HST neutral switch, the PTO switch and the PTO valve switch. Move the wiring harness to the engine side.
3. Disconnect the hydraulic suction pipe (9) and the hydraulic delivery pipes (2) (5). Loosen the pipe bands.
4. Remove the snap pins and disconnect the brake rods (8) (11).
5. Remove the sub-frame mounting bolts (7) and the sub-frames (6) (10).
6. Hook the transmission assembly.
7. Remove the main frame mounting bolts and the main frame (4).
8. Separate the transmission assembly from the tractor main frame (4).
9. Remove the spring pins from the propeller shaft (13).

(When assembling)

Connection of couplings

- Set the rear wheels to the tractor.
- Firstly install the coupling between the front axle pinion shaft and the front wheel drive shaft under the engine.
- Install the coupling and the propeller shaft to the clutch shaft.
- Secondly align the spline between the front wheel drive shaft and the universal joint.
- Thirdly, push the transmission assembly slowly to the main frame side, and align the spline between propeller shaft and the first shift shaft. Align the universal joint and the front wheel drive shaft (17).
- Fourthly, install the split pins (16) from the down side.

(4) Hydrostatic Transmission (HST)

Separating Transmission Case

1. Disconnect the brake rods.
2. Disconnect the code bands from the wiring harness. Disconnect the couplers from the HST neutral switch and the PTO neutral switch. Separate the wiring harness from the transmission case.
3. Loosen the pipe bands.
4. Disconnect the hydraulic inlet pipe. Disconnect the independent PTO valve delivery pipe. Disconnect the hydraulic cylinder delivery pipe.
5. Hoist the transmission case and the main frame. Support the transmission with a jack.
6. Remove the main frame mounting bolts.
7. Separate the transmission assembly from the main frame.
8. After separating the transmission, remove the rear wheels and the transmission outer parts installed to the transmission.

(When reassembling)
- Tighten the transmission mounting bolts and nuts to the specified torque.

(11) Mid-PTO Section

Mid-gear and Idle Shaft (Mid-PTO Model)
1. Remove the idle shaft (2) from the transmission case using a screw driver.
2. Remove the mid-gear (1) from the transmission case.
3. Remove the ball bearings (4) (5) and the internal cir-clip (6) from the mid-gear (1).

(When reassembling)
- Install the internal cir-clip (6) to the inner groove of the mid-gear (1) securely.

(1) 30T Mid-gear   (4) Ball Bearing
(2) Idle Shaft     (5) Ball Bearing
(3) Spring Pin     (6) Internal Cir-clip
Mid-PTO Case and Mid-gear Shaft (Mid-PTO Model)

1. Remove the mid-PTO case mounting bolts.
2. Remove the mid-PTO case from the transmission case.
3. Remove the mid-PTO oil seal (4) from the mid-PTO case (2) using a screwdriver not to damage it.
4. Remove the internal cir-clip (5).
5. Remove the mid-gear shaft (3) with the ball bearings (6) (7).
6. Remove the bearing (6) (7) from the mid-gear shaft (3).

(When reassembling)

- If the mid-PTO oil seal (4) is defective, worn or scratched, replace it.
- Apply grease to the lip and the outer of the mid-PTO oil seal (4).
- Apply liquid gasket (Three Bond 1206D or equivalent) to the joint surface A of the transmission case and the mid-PTO case (2).

**Pump Shaft**
1. Pull out the pump shaft from the HST housing case.
2. Check the oil seal surface (1) the bearing surface (2) and the bearing.
3. If the shaft is rough or grooved, replace it.
4. If the bearing is worn, replace it.

**Motor Shaft**
1. Pull out the motor shaft from the HST housing case.
2. Check the oil seal surface (1) the bearing surface (2) and the bearing.
3. If the shaft is rough or grooved, replace it.
4. If the bearing is worn, replace it.

**Cylinder Block Bore and Pistons**
1. Lift all the pistons gently with the retainer plate (1).
2. Check the pistons for their free movement in the cylinder block bores.
3. If the piston or the cylinder block bore is scored, replace cylinder block assembly.

**IMPORTANT**
- Do not interchange pistons between pump and motor cylinder block. Pistons and cylinder blocks are matched.

**Piston Slipper and Retainer Plate**
1. Check the slipper (1) for flatness.
2. If rounded, replace piston.
3. Measure the thickness of piston slipper.
4. If the measurement is less than the allowable limit, replace the piston.
5. Check the lubricant hole (2) for clogging.

**IMPORTANT**
- Do not interchange pistons between pump and motor cylinder block. Pistons and cylinder blocks are matched.

(1) Piston Slipper  (2) Lubricant Hole
**Cylinder Block Face**

1. Check the polished face (1) of cylinder block for scoring.
2. If scored, replace cylinder block assembly.
3. Check the spring (3) for breakage.
4. If broken, replace cylinder block assembly.

(1) Polished Face (2) Cir-clip (3) Spring

**Valve Plate and Center Section Face**

1. Check the engagement of the valve plate (1) and the anchor pin (2).
2. Pushing the valve plate (1) against the anchor pin (2), lift it to remove.
3. Check the valve plate (1) for foreign particles.
4. Clean the valve plate (1) and dry with compressed air.
5. Check the valve plate (1) for scratches, wear and erosion. (Run a finger nail across the valve plate surface. If worn, it will be felt.)
6. If worn or scored, replace it.

**NOTE**
- After checking, coat them with hydrostatic transmission oil.

(1) Valve Plates (2) Anchor Pin (3) Center Section Face

**Thrust Plates and Bearing Surface**

1. Check the thrust plate (1) for scratches and excessive wear.
2. If worn or scored, replace it.
3. Check the bearing surface (2) of trunnion shaft (swashplate)(3) for scratches and excessive wear.
4. If worn or scored, replace it.

(1) Thrust Plate (2) Bearing Surface (3) Trunnion Shaft

**Trunnion Shaft Cover**

1. Check the bearing (2) for scratches and excessive wear.
2. If worn or scored, replace it.
3. Check the oil seal (3) and the O-rings (1) for damage.

**NOTE**
- After checking, coat the bearings with hydrostatic transmission oil, and the oil seal lip and the O-rings (1) with grease.

(1) O-ring (2) Bearing (3) Oil Seal
**Center Section Oil Seals and Bearings**
1. Check the oil seals (1) for damage.
2. Check the needle bearings (2) for wear.
3. If the needle bearings (2) and oil seals (1) are worn, replace all seals and needle bearings.

**NOTE**
- After checking, coat the bearing with hydrostatic transmission oil and the oil seal lip with grease.

**Check and High Pressure Relief Valve**
1. Check the valve plug (4) and valve (1) for scratches and damage.
2. Check the valve seat in the port block for damage.
3. Check the spring (2) for breakage and wear.
4. If anything unusual, replace the check and high pressure relief valve assembly.

Backlash between Differential Pinion and Differential Side Gear
1. Secure the differential case with a vise.
2. Set the dial indicator (lever type) with its finger on the tooth of the differential side gear.
3. Press differential pinion and side gear against the differential case.
4. Hold the differential pinion and move the differential side gear to measure the backlash.
5. If the backlash exceeds the allowable limit, adjust with differential side gear shims.

Backlash between Spiral Bevel Pinion and Spiral Bevel Gear

1. Set the dial indicator (lever type) with its finger on the end of spiral bevel pinion (3).
2. Move the spiral bevel pinion back and forth to each end and measure the side clearance.
3. If the side clearance exceeds the factory specifications, adjust with the shims (2) at front end of spiral bevel pinion.
4. Set the dial indicator (lever type) with its finger on the tooth surface of bevel gear.
5. Measure the backlash by fixing the spiral bevel pinion (2) and moving bevel gear (5) by hand.
6. If the backlash exceeds the factory specifications, adjust with the shims (2), (7) at bearing holder (4) and differential case.
7. Adjust the backlash properly by repeating the above procedure.

4 REAR AXLE
CONTENTS

1. STRUCTURE ........................................................................................................ 4-M1
1. STRUCTURE

The rear axles are the semi floating type with ball bearing (2) between the rear axle (4) and the rear axle case (3), which supports the rear wheel load as well as transmitting power to the rear wheels.

The differential gears (7) automatically control the revolution of right and left wheels when the rear wheels encounter unequal resistance during turning.

3. DISASSEMBLING AND SERVICING

[1] DISASSEMBLING AND ASSEMBLING

Draining Transmission Fluid

CAUTION

- Stop the engine before checking and changing the transmission fluid.
- 1. Place the oil pan under the tractor.
- 2. Remove the drain plugs (1) (3) (5) at the mid-PTO shaft and at the bottom of the rear axle cases (4) (6).
- 3. Drain the transmission fluid.
- 4. After draining the transmission fluid, reinstall the drain plugs (1), (3), (5).

IMPORTANT

- Use only KUBOTA UDT oil. Use of other oils may damage the transmission or hydraulic system. Refer to "LUBRICANTS, FUEL AND COOLANT" (See page G-7).
- Never work the tractor immediately after changing the transmission oil. Keep the engine at medium speed for a few minutes to prevents damage to the transmission.
- Do not mix different brands oil together.

Removing Rear Wheels and Rear Axle

**[Hexagon rear axle : B1830, B2230, B2530]**
1. Support the tractor sub-frame with a jack.
2. Remove the snap pin (1) and the pin (2).
3. Loosen and remove the nut (5).
   - Remove the spring washer (4) and the bolt (3).
4. Remove the rear wheel from the rear axle (12).

**[Hub rear axle : B3030] (Refer to hexagon rear axle.)**
1. Support the tractor sub-frame with a jack.
2. Remove the rear wheel mounting bolts and the nuts.
3. Remove the rear wheel.
4. Disconnect the brake rods.
5. Remove the rear axle case mounting bolts.
6. Remove the rear axle.

*(When reassembling)*
- Apply liquid gasket (Three Bond 1206D or equivalent) to the joint face of the rear axle case and the differential gear case.

[2] SERVICING

Checking Ball Bearing
1. Hold the inner race, and push and pull the outer race in all directions to check for wear and roughness.
2. Apply transmission fluid to the bearing, and hold the inner race. Then, turn the outer race to check rotation.
3. If there is any defect, replace it.

5 BRAKES
MECHANISM

CONTENTS

1. FEATURE ...................................................................................................... 5-M1
2. OPERATION .................................................................................................. 5-M2
1. FEATURE

Independent mechanical wet disc brakes are used for the right and left travelling brakes. They are operated by the brake pedals through the mechanical linkages and provide stable braking and require little adjustment. The parking brake is mechanical type which is designed to actuate the travelling brakes through the parking brake linkages. When pulling the parking brake lever (6), parking brake mechanism is the same mechanism of travelling brake operated.

■ Features of Wet Disc Brakes
1. Reduced disc wear
   Although wet discs are worn by approx. several tens of microns depending on the accuracy of parts during the initial contact in initial period of 50 hours or so, almost no wear occurs afterward. This means that very little brake adjustments are required.

2. Stable braking
   Since the brake discs are immersed in transmission oil, *Fade* is rarely caused even after repeated braking and a stable braking force is obtained.

3. Pedal stroke does not change under influence of heat
   Unlike internal expanding type brakes, the drum-to-shoe clearance of the wet disc brake does not increase due to thermal expansion and the increased pedal stroke does not result. Thus, the wet disc brake provides a constant pedal stroke.

*Fade*
Fade is a phenomenon of braking force loss caused by the heat generated in repeated braking. Generally, the friction coefficient of brake disc tends to lower and the braking force reduces with the rise of the temperature of the brake disc.

(Reference)
- Relationship between temperature and friction coefficient of brake disc is shown in the graph.

(1) Rear Axle Case  A: Friction Coefficient
(2) Brake Cam Lever  B: Temperature
(3) Brake Rod
(4) Turnbuckle
(5) Brake Pedal
(6) Parking Brake Lever

W1012645
2. OPERATION

The brake body incorporated in the rear axle case (1) filled with transmission oil and is designed to brake when the brake disc (8) splined with the differential gear shaft (3) is pressed against the cam plate (7) by means of the cam mechanism incorporating steel balls (2).

For greater braking force, three brake discs are provided at the right and left sides respectively, and two friction plates (6) fixed to the rear axle case are arranged between the brake discs.

■ During Braking

When the brake pedal is pressed, the linkage causes the brake cam lever (4) and brake cam (5) to turn into the direction of arrow shown in the above figure.

Therefore, the cam plate (7) also moves to the direction of arrow. At this time, since the cam plate (7) rides on the steel balls (2) set in the grooves of the rear axle case to press the brake disc (8), the differential gear shaft (3) is braked by the frictional force generated by the cam plates (7) and brake discs (8).

(1) Rear Axle Case    (5) Brake Cam
(2) Steel Ball        (6) Friction Plate
(3) Brake Shaft       (7) Cam Plate

4. CHECKING, DISASSEMBLING AND SERVICING

[1] CHECKING AND ADJUSTING

Adjusting Brake Pedal Free Travel

CAUTION
- Stop the engine and chock the wheels before checking brake pedal.
- The difference between the right and left pedal plays must be equal.
1. Release the parking brake.
2. Slightly depress the brake pedals and measure free travel at top of pedal stroke.
3. If the measurement is not within the factory specifications, loosen the lock nut and turn the turnbuckles to adjust the brake rod length.
4. Retighten the lock nut securely.
   Keep the free travel in the right and left brake pedals equal.

<table>
<thead>
<tr>

<td>Keep the free travel in the right and left brake pedals equal.</td>
</tr>
</tbody>
</table>

■ NOTE
- After checking brake pedal free play, be sure to engage the parking brake lever fully and check to see that the brake pedals are securely locked.

(1) Brake Pedal
(2) Turnbuckle
(3) Lock Nut

L : Brake Pedal Free Travel
Checking Parking Brake Lever Travel
1. Pull the parking brake lever (1) to the parking position while counting the ratchet sound made by the parking brake lever (1).
2. If the counted ratchet sound is not within the factory specification, adjust the parking brake lever travel.

⚠ CAUTION
- Stop the engine and remove the key, and the chock wheels before checking parking brake.

<table>

(3) Adjusting Nut       (6) Parking Brake Rod
[2] DISASSEMBLING AND ASSEMBLING

Separating Brake Pedal

1. Remove the right hand side step.
2. Remove the HST pedal. (HST Model)
3. Remove the pins (11) and disconnect the brake rods (9), (12).
4. Remove the return spring (8).
5. Remove the external snap ring (7) at the end of the brake pedal shaft (1).
6. Remove the clevis pin (4) of the brake pedal LH (5) and remove the clevis pin (3) of the clutch pedal (2).
7. Pull the right and left brake pedals from the brake pedal shaft (1).
8. Tap out the brake pedal shaft (1) to the left, and remove it with the clutch pedal (2).

(Brake Pedal)
1. Remove the right hand side step.
2. Remove the HST pedal. (HST Model)
3. Remove the pins (11) and disconnect the brake rods (9), (12).
4. Remove the return spring (8).
5. Remove the external snap ring (7) at the end of the brake pedal shaft (1).
6. Remove the clevis pin (4) of the brake pedal LH (5) and remove the clevis pin (3) of the clutch pedal (2).
7. Pull the right and left brake pedals from the brake pedal shaft (1).
8. Tap out the brake pedal shaft (1) to the left, and remove it with the clutch pedal (2).

(Parking Brake)
1. Remove the lock nuts and remove the parking brake rods (14), (18).
2. Remove the pin (13) and disconnect the brake rods (9), (12).
3. Disconnect the parking brake arm (15) from parking brake lever plate (20).
4. Remove the clevis pin (16) and remove the parking brake arm (15) and arm shaft (17).
5. Remove the parking brake lever (19) and parking brake lever plate (20) as a unit.

(When reassembling)
- Apply grease to the brake pedal shaft.
- Be sure to adjust the brake pedal free travel and parking brake lever travel.
Draining Transmission Oil
1. Refer to “TRANSMISSION” section.

Rear Axle Case
1. Refer to “REAR AXLE” section.

Differential Lock Clutch and Final Gear
1. Remove the spring (1).
2. Remove the differential lock clutch (3) and the differential shift fork (2).
3. Remove the external cir-clip (5).
4. Remove the ball bearing with a puller.
5. Remove the final gear (6).

Brake Assembly
1. Remove the differential fork lever (1).
2. Remove the internal snap ring (3).
3. Remove the brake shaft (2) with the brake disks and the brake places as an assembly.

When reassembling
• When installing the internal snap ring (3) to the rear axle case as shown in the picture.
• When installing the bearing holder to the rear axle case, do not forget to install the straight pin (4).

(1) Spring          (4) Ball Bearing
(2) Differential Lock Shift Fork (5) External Cir-clip
(3) Differential Lock Clutch (6) Final Gear

(1) Differential Fork Lever (4) Straight Pin
(2) Brake Shaft            (5) Bearing Holder
(3) Internal Snap Ring

(1) Spring          (4) Ball Bearing
(2) Differential Lock Shift Fork (5) External Cir-clip
(3) Differential Lock Clutch (6) Final Gear
Brake Disks, Brake Plates and Brake Shaft

1. Remove the external cir-clip (6), and remove the brake disks (4) and the brake plates (5).
2. Remove the bearing holder (3) and the ball bearing (2).

(When reassembling)

■ NOTE
- Since the length of the brake shaft (LH) and the brake shaft (RH) are different, don’t exchange them.
- Install the brake disks with their holes (7) deviation at less than 1/3 of the total hole area.

Brake Cam Plate and Brake Cam Lever

1. Remove the brake cam plate (1) and the balls (3).

(When reassembling)
- Apply grease to the balls (3).
- If O-ring (4) is defective, change it.
- Install the brake cam lever (3) to the brake cam plate (1) securely.
- Move the brake cam lever (3) by hand to check the movement. If the movement is heavy, refine the brake cam plate (1) with emery paper.

[3] SERVICING

Brake Cam Lever Movement
1. Move the brake cam lever by hand to check the movement.
2. If the movement is heavy, refine the brake cam with emery paper.

Cam Plate Flatness and Bearing Holder Wear
1. Place a straightedge of 150 mm (5.91 in.) or more in length on the contacting surface of the cam plate and the bearing holder.
2. Inspect the friction surface of the cam plate and the bearing holder with the straightedge, and determine if a 0.30 mm (0.0118 in.) feeler gauge will fit on the part of wear.
3. If it will fit, resurface the cam plate.

Height of Cam Plate and Ball
1. Measure the height of the cam plate with the ball installed.
2. If the measurement is less than the allowable limit, replace the cam plate and balls.
3. Inspect the ball holes of cam plate for uneven wear.
4. If the uneven wear is found, replace it.

   [1] 4 WHEEL DRIVE MODEL ......................................................................................... 6-M1
1. STRUCTURE

[1] 4 WHEEL DRIVE MODEL

The front axle of the 4WD is constructed as shown above. Power is transmitted from the transmission through the propeller shaft (15) to the spiral bevel pinion shaft (16), then to the spiral bevel gear (11) and to the differential side gear (9).

The power through the differential side gear (9) is transmitted to the differential bevel pinion shaft (7) (12), and to the bevel gear shaft (17) through the bevel gears (4) (6) in the bevel gear case (5).

The revolution is greatly reduced by the bevel gears (17) (3), then the power is transmitted to the axle (1).

The differential system allows each wheel to rotate at a different speed to make turning easier.

4. CHECKING, DISASSEMBLING AND SERVICING

[1] CHECKING AND ADJUSTING

**Toe-in**
1. Inflate the tires to the specified pressure.
2. Turn the front wheels straight ahead.
3. Measure the toe-in \((B) - (A)\).
4. If the measurement is not within the factory specifications, adjust the tie-rod length.

<table>
<thead>
<tr>
<th>Toe-in ((B) - (A))</th>
<th>Factory spec.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0 to 10 mm</td>
</tr>
<tr>
<td></td>
<td>0 to 0.39 in.</td>
</tr>
</tbody>
</table>

(A) Wheel to Wheel Distance at front  
(B) Wheel to Wheel Distance at rear

**Toe-in Adjusting**
1. Loosen the lock nut (2).
2. Turn the tie-rod joint (1) to adjust the rod length until the proper toe-in measurement is obtained.
3. Retighten the lock nut (2).

(1) Tie-rod Joint  
(2) Lock Nut

KiSC issued 03, 2007 A
**Front Axle Locking Force**

1. Jack up the front side of tractor.
2. Set a spring balance to the front axle flange.
3. Measure the front axle locking force.
4. If the measurement is not within the factory specifications, adjust with the adjusting screw (1). After applying liquid gasket (Three Bond 1206D or equivalent) to the thread portion of the adjusting screw (2) to prevent front axle oil from leaking out of the front axle holder (3).
5. Tighten the lock nut (2) firmly.

[2] DISASSEMBLING AND ASSEMBLING

(1) Separating Front Axle Assembly

Draining Front Axle Case Oil
1. Place the oil pans underneath the front axle case.
2. Remove the both right and left hand side drain plugs (1) and filling plug (2) to drain the front axle case oil.
3. After draining, reinstall the drain plugs (1).
4. Fill with new oil up to the upper notch on the dipstick.

**NOTE**
- After ten minutes, check the oil level again, add oil to prescribed level.
- Use KUBOTA SUPER UDT fluid or SAE 80, 90 gear oil. Refer to "LUBRICANTS, FUEL AND COOLANT".

<table>

A : Oil level is acceptable within this range

Front Wheels and Steering Cylinder Hoses
1. Disconnect the delivery hoses (1), (3).
2. Lift up the tractor front side.
3. Loosen the hose clamps (4) and slide the front cover (5).
4. Remove the front wheels.

**NOTE**
- After disconnecting the delivery hoses, do not steer the front axle so that the steering oil may come out from the delivery hoses.

**IMPORTANT**
- Connect the delivery hoses to the original position.
(When reassembling)
  - Be sure to assemble the delivery hose RH and LH as shown in figure.

(Bleeding air in power steering circuit)
- Start the engine.
- Turn the steering wheel slowly in bolt directions all the way alternately several times, and stop the engine.

Front Axle Holder and Front Axle
1. Place the disassembling stand under the front axle.
2. Remove the front axle holder mounting bolts (1).
3. Separate the front axle holders (2), (3).
4. Separate the front axle from the front axle frame.

(When reassembling)
- Slide the coupling and the front cover to the front drive shaft.
- Align the front axle holders to the front axle frame, and align the coupling to the bevel pinion shaft spline.

Spiral Bevel Pinion Shaft and Differential Gear Assembly

1. Remove the oil seal from the front axle case.
2. Remove the internal cir-clip (2) and the collar (3).
3. Tap out the spiral bevel pinion shaft (4) to the rear side.
4. Take out the differential gear assembly (6) from the right side of the front axle case.
5. Remove the nut (1) from the spiral bevel pinion shaft (4).
6. Remove the taper roller bearings (8).

(When reassembling)
- Replace the oil seal and the nut (1) with new one.
- Apply grease to the oil seal.
- Tighten up the nut (1) until the turning torque of the spiral bevel pinion shaft reaches the factory specifications. (See page 5-S15).
- Install the same shims and collars before they are removed.
- Install the taper roller bearing correctly, noting their direction, and apply gear oil to them.
- Stake the lock nut firmly.

Differential Gear

1. Remove the external cir-clip (2) from the differential case (8).
2. Tap out the spring pins (11) from the differential yoke shafts (1) (10).
3. Remove the differential yoke shafts (1) (10) from the differential case (8).
4. Remove the bevel gears (6) and the collars (5) from the differential case (8).
5. Remove the spiral bevel gear (3) and the ball bearings (4) from the differential case (8).

■ NOTE
- Arrange the parts to know their original position.
(When reassembling)
- Apply molybdenum disulfide (Three Bond 1901 or equivalent) to the inner circumferential surface of the differential bevel gears (6) and differential pinion (7).
[3] SERVICING

Clearance between Differential Case (Differential Case Cover) and Differential Side Gear
1. Measure the differential side gear boss O.D..
2. Measure the differential case bore I.D., and calculate the clearance.
3. Measure the differential case cover bore I.D., and calculate the clearance.
4. If the clearance exceeds the allowable limit, replace faulty parts.

| Clearance between differential case (differential case cover) and differential side gear | Factory spec. | 0.040 to 0.082 mm
|                                                                                     |               | 0.00157 to 0.00323 in. |
|                                                                                     | Allowable limit | 0.17 mm
|                                                                                     |               | 0.0067 in. |

|                                                                                     |               | 1.02122 to 1.02205 in. |

Clearance between Differential Pinion Shaft and Differential Pinion
1. Measure the differential pinion shaft O.D..
2. Measure the differential pinion I.D., and calculate the clearance.
3. If the clearance exceeds the allowable limit, replace faulty parts.

| Clearance between differential pinion shaft and differential pinion | Factory spec. | 0.038 to 0.068 mm
|                                                                     |               | 0.00150 to 0.00268 in. |
|                                                                     | Allowable limit | 0.17 mm
|                                                                     |               | 0.0067 in. |
| Differential pinion shaft O.D.                                        | Factory spec. | 9.972 to 9.987 mm
|                                                                     |               | 0.39260 to 0.39312 in. |
| Differential side gear I.D.                                          | Factory spec. | 10.025 to 10.040 mm
|                                                                     |               | 0.39469 to 0.39528 in. |

Turning Torque of Spiral Bevel Pinion Shaft
1. Cramp the spiral bevel pinion shaft assembly to the vise and tighten the staking nut.
2. Measure the turning torque of bevel pinion shaft.
3. If the turning torque is not within the factory specifications, adjust with the lock nut.

| Turning torque | Factory spec. | 0.8 to 1.0 N·m
|               |               | 0.08 to 0.10 kgf·m
|               |               | 0.59 to 0.73 lbf·ft |

■ NOTE
- After turning force adjustment, be sure to stake the lock nut.

(1) Adaptor
(2) Torque Wrench
Backlash between Spiral Bevel Pinion Shaft and Spiral Bevel Gear

1. Place the fuse (2) on the gear tooth of the spiral bevel gear (1).
2. Install the spiral bevel gear (1) and the differential yoke shaft (3) into the front axle case.
3. Install the spiral bevel pinion shaft (4) to the front axle case.
4. Turn the spiral bevel pinion shaft (4) holding the differential yoke shaft (3) by hand lightly.
5. Take out the fuse (2). And measure the fuse (2)
6. If the backlash is not within the factory specifications, change the adjusting collars (5) (6). For example change the adjusting collar (6) to 0.1 mm (0.004 in.) smaller size, and change the adjusting collar (5) to 0.1 mm (0.004 in.) larger size.
7. Adjust the backlash properly by repeating the above procedures.

<table>
<thead>

Clearance between Front Axle Case Bosses and Bracket Bushing
1. Measure the front axle case bosses O.D. with an outside micrometer.
2. Measure the bracket Bushing I.D. with a cylinder gauge, and calculate the clearance.
3. If the clearance exceeds the allowable limit, replace the bracket bushing.
4. If the clearance still exceeds the allowable limit, replace the front axle case.

Press-fitting Bushing
- When replacing the bushings (1), press-fit it until bushing contact to inside of the front axle bracket holder.
- Apply grease to the O-rings (2) and take care not to damage it.

NOTE
- After replacing the bushing, be sure to adjust the front axle locking force. (See page 6S-5).

7 STEERING
CONTENTS

1. HYDRAULIC CIRCUIT.............................................................. 7-M1
2. STEERING CONTROLLER .................................................. 7-M2
3. STEERING CYLINDER............................................................ 7-M3
1. HYDRAULIC CIRCUIT

The model is provided with a full hydrostatic power steering.

In the hydrostatic power steering, the steering control is connected to the steering cylinder with only the hydraulic piping. Accordingly, it does not have mechanical transmitting parts such as steering gear, pitman arm, drag link, etc. Therefore, it is simple in construction. This steering system consists of oil filter cartridge (5), hydraulic pump (4), steering controller (2), steering cylinder (1), etc.

By operating the power steering body, the required amount of oil is fed to the steering cylinder (1).

(1) Power Steering Cylinder  A: Independent PTO Control Valve
(2) Power Steering Controller  B: HST
(3) Oil Cooler  C: To 3-Points Hitch
(4) Hydraulic Pump (for Power Steering, Independent PTO and HST)
(5) Oil Filter Cartridge
(6) Hydraulic Pump (for 3-Points Hitch)
2. STEERING CONTROLLER

The steering controller consists of a control valve (4) and a metering device (3).

■ Control Valve

The control valve is a rotating spool type. When the steering wheel is not turned, the position of the spool (7) and sleeve (9) is kept neutral by the centering spring (8). This causes the forming of a "Neutral" oil circuit. When the steering wheel is turned either clockwise or counterclockwise, the position of the spool and sleeve changes in relation to the centering spring. This allows the forming of a "Right Turning" or "Left Turning" oil circuit. At the same time, the gear pump (Metering device) rotates with the spool and sends the oil to the cylinder corresponding to the rotation of the steering wheel.

■ Metering Device

An oil, sent from the hydraulic pump to the steering cylinder, passes through the metering device (3). Namely, when the rotor is driven, two chambers suck in oil due to volumetric change in the pump chambers formed between the rotor (12) and the stator (13), while oil is discharged from other two chambers. On the other hand, rotation of the steering wheel is directly transmitted to the rotor through the spool (7), drive shaft (10), etc. Accordingly, the metering device serves to supply the steering cylinder with oil, amount of which corresponds to the rotation of the steering wheel. The wheels are thus turned by the angle corresponding to the rotation of the steering wheel. When the engine stops or the hydraulic pump malfunctions, the metering device functions as a manual trochoid pump, which makes manual steering possible.

■ Relief Valve

The relief valve (1) is located in the steering controller. It controls the maximum pressure of the power steering system.

Its setting pressure is as follows.

11.9 to 12.8 MPa
121 to 131 kgf/cm²
1726 to 1856 psi
3. STEERING CYLINDER

The steering cylinder is single piston both rod double-acting type. This steering cylinder is installed parallel to the front axle and connected to tie-rods.

The tie-rods connected to both knuckle arm guarantees equal steering movement to both front wheels.

The steering cylinder provide force in both directions. Depending upon direction the steering wheel is turned pressure oil enters at one end of the cylinder to extend, or the other end to retract it, thereby turning front wheel of the tractor.

4. CHECKING, DISASSEMBLING AND SERVICING

[1] CHECKING

(1) Relief Valve

Relief Valve Operating Pressure
1. Disconnect the power steering hose LH (or RH) from steering the power steering cylinder, and set a pressure gauge and cable.

(Reference)
- Hose and adaptor size : 9/16-18UNF, 37° flare.
- Start the engine and set at maximum speed (2600 min⁻¹ (rpm)).
- Fully turn the steering wheel to the left (or right) to check the feeling which the steering wheel lightly locks. Read the relief valve operating pressure when the steering wheel to the above-mentioned lock position by operation force at approximately 9.8 N (1 kgf, 2.2 lbf) of outer.

■ NOTE
- After set a pressure gauge, be sure to bleed air.
- Note that the pressure value changes by the pump action of the power steering controller when the steering operation is continued after the steering wheel is lightly locked and accurate relief valve pressure cannot be measured.

(Bleeding air in power steering circuit)
- Start the engine.
- Turn the steering wheel slowly in both directions all the way alternately several times, and stop the engine.

<table>

Tie-rod Joint
1. Remove the slotted nut (4) and remove the tie-rod joint (3).
2. Remove the front axle brackets (1) (2).

(When reassembling)
- Apply grease to the thrust collar of front axle bracket.
- Apply grease to the O-ring and take care not to damage it.
- After tightening the slotted nut, install cotter pin as shown in the figure.

(Bleeding air in power steering circuit)
- Start the engine.
- Turn the steering wheel slowly in both directions all the way alternately several times, and stop the engine.

| Tightening torque          | Tie-rod slotted nut | 17.7 to 34.3 N·m |
|                           |                    | 1.8 to 3.5 kgf·m |

(3) Tie-rod Joint
Power Steering Cylinder

⚠️ CAUTION

- Since power steering cylinder is full of high-pressured steering oil, high-pressured oil is injected out from hose adopters by pushing piston rods.
- This injected oil can penetrate the skin or eyes causing serious injury.
- Use appropriate protective wear to prevent serious injury.
- Use waste to cover the adopters.
- Before disassembling drain steering oil from power steering cylinder.

1. Remove the tie-rod joint(4) from the rod (1) using spanners (2) (3).
2. Remove the adaptors (8) (9).
3. Remove the rod cover (7).
4. Tap out the rod (1) to the right front wheel side.

(When reassembling)

- Apply the liquid lock (Three Bond 1375N or equivalent) to the tie-rod joint (4).

1. HYDRAULIC CIRCUIT

The hydraulic system are composed of hydraulic pumps (10) (12), power steering, independent PTO, HST (1), and 3-points hitch and other components.

1. Hydraulic power take off from the hydraulic block type outlet to operate the implements such as a front loader, front blade, rear blade and etc..

2. Hydraulic oil operates power steering, independent PTO clutch, HST and 3-point hitch.
2. HYDRAULIC PUMP

The hydraulic pump is composed of the casing (1), side plate (4), and two spur gears (drive gear (3) and driven gear (2)) that are in mesh.

Hydraulic pump is driven by the fuel camshaft.

Maximum displacement is as follows.

### Hydraulic Pump (for 3-points Hitch)

3. HYDRAULIC BLOCK

The hydraulic block type outlet is located at the right hand side of the engine.

This hydraulic block type outlet is provided to take power out from the tractor to operate the hydraulic cylinders on the implement, such as front end loader, front blade and so on.

(1) Hydraulic Block Cover  A: To Implement
(2) O-Ring  B: From Implement
(3) Delivery Pipe  C: From Hydraulic Pump
D: To Control Valve

KiSC issued 03, 2007 A
4. POWER STEERING

[1] HYDRAULIC CIRCUIT

Hydraulic oil for power steering is forced by the hydraulic pump (6). Hydraulic oil in the power steering controller is controlled by the steering wheel. The controlled oil is forced to the power steering cylinder. The oil to the controller is forced return through oil cooler (4) to independent PTO (3) and HST (5).

(9) 3-Points Hitch

KiSC issued 03, 2007 A
[2] POWER STEERING CONTROLLER

Power steering controller (1) controls hydraulic oil from hydraulic pump.

Power steering controller is connected to hydraulic pump, power steering cylinder, and oil cooler.

Since this power steering controller is a complete part and can not be disassembled, component parts in this power steering controller are not provided by KUBOTA.

(1) Power Steering Controller
(2) Relief Valve
(3) Power Steering Cylinder

B : Oil from Hydraulic Pump
C : To Independent PTO and HST
[3] **STEERING CYLINDER**

Steering cylinder is located at the front side of the front axle case (1).

Steering cylinder is connected to the front gear cases. Power steering hoses from power steering controller are connected to the adaptors of the steering cylinder.

Steering cylinder is composed of tie rod joints (3), piston (4), cylinder (5), adaptors (6) and etc.

5. INDEPENDENT PTO
[1] HYDRAULIC CIRCUIT

Independent PTO control valve (2) is located at transmission case (1).

The independent PTO control valve (2) is composed of PTO arm (3), poppet (5), ball (7) and etc..

The PTO arm (3) is connected to control rod (4) and the independent PTO lever.

The PTO arm (3) is moved to "OFF" or "ON" position by the independent PTO lever.

Oil passage in the PTO arm (3) is turned by the independent PTO lever.

When the PTO arm (3) is moved to "OFF" position, oil in the independent PTO control valve does not flow to the oil passage.

When the PTO arm (3) is moved to "ON" position, oil in the independent PTO control valve flow to the oil passage.

Poppet (5) and spring (6) operate as a relief valve.

(4) Control Rod
(5) Poppet
(6) Spring
(7) Ball
(8) Spring

A : PTO Arm "OFF" Position
B : PTO Arm "ON" Position
Independent PTO clutch (2) is located behind the HST pump shaft (1) in the transmission case.

Independent PTO clutch (2) is operated with pressurized hydraulic oil forced from the independent PTO control valve (3).

When independent PTO lever is shifted to "ENGAGED" position, hydraulic oil is forced through the transmission case inner passage A and PTO clutch shaft (6) to PTO clutch. In this state, power from HST pump shaft is transmitted through independent PTO clutch (2) to independent PTO clutch shaft (6).

When independent PTO lever is shifted to "DISENGAGED" position, hydraulic oil is not forced to the PTO clutch. In this state, power from HST pump shaft (1) is not transmitted to independent PTO clutch shaft (6).

A : Passage
**[4] INDEPENDENT PTO LEVER “ENGAGED”**

When the independent PTO lever (1) is shifted to the "ENGAGED" position, the PTO arm (3) is turned to "ON" position.

Hydraulic oil from P port flows through oil passage (7) of the PTO arm (3), oil passage S1 in the transmission case (6) and oil passage S2 in the PTO clutch shaft (5) to the PTO clutch (4).

Since the piston of the PTO clutch (4) is pushed by pressurized oil, clutch disks and clutch plates are pushed, and the PTO clutch (4) is engaged.

(1) Independent PTO Lever
(2) Independent PTO Control Valve
(3) PTO Arm
(4) PTO Clutch
(5) PTO Clutch Shaft

(7) Oil Passage (in the PTO arm)

A : "DISENGAGED" Position
B : "ENGAGED" Position
P : Pump Port
H : HST Port
T : Tank Port
S1 : Oil Passage (in the Transmission Case)
S2 : Oil Passage (in the PTO Clutch Shaft)
When the independent PTO lever (1) is shifted to the "DISENGAGED" position, the PTO arm (3) is turned to "OFF" position. Hydraulic oil is stopped at the PTO arm (3). This oil flows to the HST port. Oil in the PTO clutch (4) and the PTO clutch shaft (5) drains through oil passage S2, S1 and T port to the transmission case.
6. THREE POINTS HYDRAULIC SYSTEM

[1] HYDRAULIC CIRCUIT

Two hydraulic pumps (4) (6) are installed in the B1830, B2230, B2530 and B3030.

Hydraulic oil is forced from hydraulic pump (6) to the hydraulic block (7), relief valve (8), hydraulic block (9) and position control valve (10).

Three point hydraulic oil pressure is controlled by the relief valve (8).

(1) Power Steering Controller (8) Relief Valve
(2) Independent PTO (9) Rear Outlet
(3) HST (10) Remote Control Valve
(4) Hydraulic Pump (11) Hydraulic Block
   ((for Power Steering, HST, (12) Position Control Valve
   and Independent PTO) (13) Lowering Speed Adjusting
(5) Oil Filter Cartridge Valve
(6) Hydraulic Pump (14) Hydraulic Cylinder
   (for 3-Points Hitch)
(7) Hydraulic Block (for Front
   Loader and Front Blade)
[2] RELIEF VALVE

Relief valve is located at the hydraulic cylinder right hand side.

The implement control system circuit has a relief valve to restrict the maximum pressure in the circuit.

The relief valve is a guide piston type with damping effect.

Among direct acting relief valves, this type is suited to higher pressure and has larger capacity. Furthermore, this type is free from unstable operation, such as chattering, which occurs often in direct acting relief valves.

As shown in the figure, the guide is attached to the poppet (6) and a valve chamber D.C. (called the damping chamber) is formed at the bottom of the poppet (6). The inlet of the valve leads to the chamber via a clearance between the sliding portion of the poppet (6) and the valve seat (5), minimizing valve vibration with the damping effect of the chamber.

As the oil pressure in the circuit increases, so does the pressure in the damping chamber (D.C.). When the pressure rises above the valve setting and overcomes the spring force, the valve opens. Oil then flows out to the transmission case through T port, preventing any further rise in pressure. The valve closes again when enough oil is released to drop pressure below the valve setting pressure.

(Reference)
- Relief valve setting pressure :
  B1830, B2230, B2530 : 15.5 to 16.5 Mpa
  158 to 168 kgf/cm²
  2248 to 2393 psi
  B3030 : 15.2 to 16.2 MPa
  155 to 165 kgf/cm²
  1920 to 1991 psi
- Engine speed : Rated speed
- Oil temperature : 50 °C (122 °F)

This position control valve (2) is located under the hydraulic cylinder block (1).

This control valve is mechanically connected to the position control lever with linkage.

This control valve is also mechanically connected to the lift arm with a feedback rod.

This control valve controls the oil flow forced from hydraulic pump and the oil returned back from the hydraulic cylinder.

KiSC issued 03, 2007 A
■ **Neutral**

Oil forced into the control valve through P port pushes and opens the unload valve (3), and opens the unload valve (3), and then returns to the transmission case through T1 port.

Oil behind the unload valve (3) returns to the transmission case through the groove of the spool (2).

Since the check valve (9) and the poppet 2 (5) are closed, oil in the hydraulic cylinder does not flow to the transmission case. Thus, the implement remains at its fixed position.

- Sleeve
- Adjusting Bolt
- Connecting Plate
- Check Valve

P : Pump Port
C : Cylinder Port
T1 : Tank Port

■ **Lift**

When the position control lever is set to "LIFT" position, the spool (2) is pushed into the valve body (1).

The oil forced into the control valve body (1) through P port flows to two oil circuits.

The first circuit is oil flowing to the back of the unload valve (3) to close it.

The second oil circuit is oil flowing to the check valve (9) and the hydraulic cylinder through C port to lift the implement.

- Valve Body
- Spool
- Unload Valve
- Unload Poppet
- Poppet 2
- Sleeve
- Adjusting Bolt
- Connecting Plate
- Check Valve

P : Pump Port
C : Cylinder Port
T1 : Tank Port
Shockless mechanism operating (Lift to Neutral)
When the implement begins to lift up, the feedback rod connected to the lift arm pushes back the spool (2) to near "NEUTRAL" position.

When the implement lifts up near the "NEUTRAL" position, quantity of oil passing through the orifice (10) is reduced.

It causes oil pressure difference between portion B and unload poppet (4).

Since oil pressure at unload poppet (4) is higher than oil pressure at portion D, oil forced from P port pushes and opens unload poppet (4), and oil drains through T2 port to transmission case.

Quantity of oil flowing through portion B is less.
Quantity of oil flowing to unload poppet (4) is greater.

It causes oil pressure increase at portion D of the unload poppet (4).

While the implement is coming to "NEUTRAL" position, quantity of oil flowing to spool (2) is reduced at portion B. And then, oil drains through unload poppet (4) to transmission case.

It causes implement's smooth stopping at "NEUTRAL" position without shock.

(7) Adjusting Bolt
(8) Connecting Plate
(9) Check Valve
(10) Orifice

P : Pump Port
B : Portion B
C : Cylinder Port
D : Portion D
T1 : Tank Port
**Down**

When the position control lever is set to "DOWN" position, the spool (2) is pulled out from the control valve body (1).

At the same time, the adjust bolt (7) connected to the connecting plate (8) pushes the poppet (5) into the control valve body (1). And then the poppet (5) is opened.

Oil in the hydraulic cylinder is forced out from C port through and goes valve body (1) to transmission case by the weight of the implement, causing the implement to lower.

Oil forced into the control valve through P port pushes and opens the unload valve (3) and returns to the transmission case through T1 port.

KiSC issued 03, 2007 A
[4] FEEDBACK LINKAGE FOR POSITION CONTROL

When the position control lever is moved to rearward to lift the implement, the spool of the position control valve is pushed in to form a lifting circuit by the motions of the control lever arm, the control lever shaft (3), the connecting arm (7) and the lever (8). After the lift arm (1) moves upward, the spool is pulled out and returns to form a neutral circuit by the motions of the feedback rod (2), the feedback arm (4), the feedback, the arm shaft (5), the connecting arm (7) and the lever (8).

As a result, the implement height can be easily determined in proportion to the set position of the position control lever.

Neutral
Pressure-fed oil from the hydraulic pump is delivered into the P port, and flows to the rear hydraulic outlet through BY port.

At this time, oil from A port to the T port is blocked by the mechanical check valve (Poppet (1)). Therefore the position of implement is maintained at the set position.

Lift
When the remote control valve operating lever is set to LIFT position, the spool (3) moves to the right and the passage from P port to the BY port is blocked by the spool (3).

Then the pressure-fed oil open the poppet (1) and flow through the A port to the hydraulic cylinder to lift the implement.

Down
When the remote control valve operating lever is set to DOWN position, the spool (3) moves to the left and the passage from P port to the BY port is blocked by the spool (3). At the same time, the piston (2) and poppet (1) moves upward, and open the passage from A port to T port.

Then the pressure-fed oil flow through the B port to the hydraulic cylinder to lower the implement. Return oil from hydraulic cylinder flows from A port to the transmission case.
8. REAR HYDRAULIC OUTLET

The rear hydraulic outlet is located at the right hand side of the hydraulic cylinder body. This rear hydraulic outlet is provided to take power out from the tractor to operate the hydraulic cylinders on the implement.

**NOTE**
- If the control valve of implement has the relief valve, the tank port flow from implement should be connected to the port (C).

4. CHECKING, DISASSEMBLING AND SERVICING

[1] CHECKING AND ADJUSTING

(1) Hydraulic Pump

Flowmeter Connecting and Test Preparation

**IMPORTANT**
- When using a flowmeter other than KUBOTA specified flowmeter (Code No: 07916-52792), be sure to use the instructions with that flowmeter.
- In this hook-up, there is no relief valve. Therefore while testing, do not close the flowmeter loading valve completely.

1. Open the hood and the side cover (RH).
2. Remove the hydraulic block cover (1) from the delivery pipe.
3. Install the hydraulic block for the front loader to the delivery pipe (2).
4. Install the adaptors to the hydraulic block.
5. Connect the hydraulic test hose to the adaptor and the flowmeter inlet port.
6. Connect the another hydraulic test hose to the flowmeter outlet port.
7. Open the flowmeter loading valve completely. (Turn counterclockwise.)
8. Start the engine and set the engine speed at 2600 min\(^{-1}\) (rpm).
9. Slowly close the loading valve to generate the pressure approximately 13.7 MPa (140 kgf/cm\(^2\), 1991 psi).
10. Hold this condition until the oil temperature reaches approximately 50 °C (122 °F).

(Reference)
- Adaptor is included in the adaptor set (Code No: 07916-54031).

(1) Hydraulic Block (2) Delivery Pipe
(3) Hydraulic Block (for Front Loader) (4) Adaptor

W1011231
Pump Test

■ NOTE
• Before pump testing, perform the flowmeter connecting and test preparation.

1. Open the loading valve completely.
2. Start the engine and set at rated speed.
3. Read and note the pump delivery at no pressure.
4. Slowly close the loading valve to increase pressure approx. 15.2 MPa (155 kgf/cm², 2204 psi) [B1830, B2230, B2530] or 15.9 MPa (162 kgf/cm², 2305 psi) [B3030].
5. Read and note the pump flow at rated pressure.
6. Open the loading valve and stop the engine.

(2) Independent PTO Control Valve

Independent PTO Control Valve Operating Pressure
1. Remove the plug (2) with a hexagon wrench.
2. Install the adapter (3) to the independent PTO control valve (1).
3. Connect the cable and the pressure gauge to the adapter (3).
4. Start the engine and set at the maximum speed.
   Pressure at "ENGAGED" position.
5. Move the independent PTO lever (9) to "ENGAGED" position B.
6. If the pressure is not the factory specifications, replace the spring with a new one.

[2] DISASSEMBLING AND ASSEMBLING

(1) Hydraulic Pump

**Removing Hydraulic Pump**
1. Open the bonnet then remove the front grille, side cover (RH) and disconnect the battery grounding cord.
2. Disconnect the connector of the engine stop solenoid and accelerator rod.
3. Disconnect the power steering delivery pipe and disconnect the delivery pipe (5) from the oil cooler. Relief to "HYDRAULIC SYSTEM" section.
4. Remove the engine stop solenoid using a small size ratchet handle and 10 mm thin socket.
5. Disconnect the suction hose.
6. Disconnect 3-points hitch delivery pipe and the hydraulic pump.

(When reassembling)
- Apply liquid gasket (Three Bond 1206D or equivalent) to engine stop solenoid.

**NOTE**
- For fastening hydraulic pipe nut, use two wrenches. Hold the fitting with a wrench, turn the pipe nut with another wrench to avoid damage at fitting installed part.

<table>

Checking the Length of the Adjusting Bolt

- NOTE
  - Before disassembling the control valve, check the length of the adjusting bolt.
  1. Push the spool (1) into the control valve (2).
  2. Check the length L of the adjusting bolt (3) as shown in the picture.

(Reference)
- Length L: Approx. 10.70 mm
  0.421 in.

(1) Spool
(2) Control Valve
(3) Adjusting Bolt
(4) Connecting Plate
(5) Nut

L: Length of the adjusting bolt

KiSC issued 03, 2007 A
Control Valve

NOTE
- When the control valve is installed in the hydraulic cylinder, the hexagon wrench is not aligned straight to the hexagon bolt without pushing the spool as shown in the picture.

1. Push the spool (1) into the control valve (3).
2. Remove the hexagon bolts (2) with a hexagon wrench (4).

(1) Spool  (4) Hexagon Wrench
(2) Hexagon Bolt  (5) Adjusting Bolt
(3) Control Valve
**Relief Valve**

1. Remove the plug (2), and draw out the washer (7), the shim (6), the poppet (4) and the valve seat (3).

*(When reassembling)*

- Take care not to damage the O-ring.

<table>

### NOTE
- Some colors shown in the above table are not used in B30 series tractor wirings.
2. STARTING SYSTEM

When the starter switch is turned to the **PREHEAT** position, the terminal **B** is connected to the terminals **19** and **AC**. The glow plugs become red-hot, and at the same time, the glow plug indicator also lights on.

When the starter switch is then turned to the **START** position with the safety switches on, the terminal **B** is connected to the terminal **50** and **AC**. Consequently, battery current flows to the starter motor and start the engine.

The starter switch automatically returns to the **ON** position, the terminal **30** is connected only to the terminal **AC**, thereby causing the starting circuit to be opened, stopping the starter motor.

When the main switch turned from the **ON** position to the **OFF** position, the fuel cut-off solenoid moves the fuel injection pump control rack to the **“No Fuel Injection”** position and stop the engine.
The starter is a reduction type. The reduction system is used planetary gears, and the speed of gear shaft (6) is reduced to approximately one fifth of the armature shaft (8).
[2] GLOW PLUG

This plug is a two-material type QGS (Quick Glow System) for quick temperature rise, and has self-controlling function as well as excellent durability.

The heater (4) connected in series to the heater (3), which also functions as the resistor, is incorporated in the sheath tube (1) of the super glow plug.

The resistance of this heater (3) cum resistor is small when the temperature is low, while the resistance becomes large when the temperature rises.

Therefore, because sufficient current is flown to the heater (4) during the initial period of energization, the temperature rises quickly and the resistance grows with the rise in the temperature of the resistor, the flowing current is reduces to prevent the heater (4) from being heated.

The ignition point is in the area of 2 to 3 mm (0.079 to 0.118 in.) from the tip of the plug in order to reduce its projection into the combustion chamber.

![Diagram of GLOW PLUG](3TAAAB9P005A)

![Graph of GLOW PLUG Performance](3TAAAB9P006A)

[3] SAFETY SWITCH

■ Manual Transmission Model : Shuttle Switch, PTO Switch
   HST Model : PTO Switch, HST Pedal Switch

The safety switch prevents current from flowing to the starter when the safety switches are not depressed. This is to ensure safe starting.

The safety switches are located at two (Manual Transmission Model : Shuttle Switch, PTO Switch HST Model : PTO Switch, HST Pedal Switch) different positions.

(A) Released (when shifted)  a : From Main Switch
(B) Depressed (when neutral)  b : To Starter

![Diagram of SAFETY SWITCH](3TBAAD9P005A)

KiSC issued 03, 2007 A
HST Pedal Switch (HST Model) and PTO Switch (Manual Transmission Model)

[HST Model]
- This switch locates at the neutral switch stay.
- This switch is a push type.
- This switch detects the position of the HST pedal.
- When HST pedal is at “NEUTRAL” position, this switch is turned to “ON”.
- When HST pedal is at “FORWARD” or “REVERSE” position, this switch is turned to “OFF”.

[Manual Transmission Model]
- This switch locates at the bottom side of PTO clutch lever.
- This switch detects the position at the PTO clutch lever (7).
- When the PTO clutch lever (7) is at “OFF (DISENGAGED)” position, this switch is turned to “ON (ENGAGED)” position, this switch is turned to “OFF”.

(2) Plunger
(3) Injection Pump
(4) Control Rack
3. CHARGING SYSTEM

The charging system supplies electric power for various electrical devices and also charges the battery while the engine runs.

(1) Fuse  (2) Alternator  (3) Battery  (4) Slow Blow Fuse  (5) Starter Switch  (6) Charge Lamp  (7) Joint Connector
[1] ALTERNATOR

A compact alternator with an IC regulator is used, having the following characteristics:
- Approximately 26% lighter and 17% smaller than a standard alternator.
- Cooling performance and safety have been improved by combining the cooling fan with the rotor and incorporating the fan / rotor unit inside the alternator.
- IC regulator is fitted inside the alternator.
- The rectifier, IC regulator and similar components are easy to remove, making it easier to service the alternator.

[2] IC REGULATOR

An IC regulator uses solid state transistors, chips or other semiconductor elements instead of the relays in a conventional regulator. Stable characteristics are achieved by cutting off the field current.

IC regulators have the following characteristics:
- The control voltage does not change over time, so the need for readjustment is eliminated. Since there are no moving parts, IC regulators are extremely durable and resistant to vibration.
- The overheat compensation characteristics ensure that the control voltage is reduced as the temperature rises, so the battery is charged at just the right level.

The internal circuitry of the IC regulator is shown in the diagram. It consists of a hybrid IC incorporating a monolithic IC. (The internal circuitry of the monolithic IC is extremely complex, so it is shown as simply "M.IC circuit".)

Tr1 acts as the contacts controlling the field current, and Tr2 acts as the charge lamp relay controlling the flashing of the charge lamp.

The M.IC circuit controls Tr1 and Tr2, and monitors the alternator output voltage, and detects any drop in L terminal voltage or breaks in the rotor coil.
4. LIGHTING SYSTEM

The lighting system consists of main switch, combination switch, hazard light switch, position light switch, brake light switch, head lights, combination lights, brake lights, etc..

- (1) Beacon
- (2) Head Light
- (3) Combination Light
- (4) Front Combination Light

- (19) Joint Connector
- (20) Flasher Unit
- (21) Fuse Box
[1] HEAD LIGHT

The head light switch, which forms a combination switch with the turn signal light switch and horn switch, has three positions; OFF, LOW-BEAM and HIGH-BEAM.

Current passes through the light circuit as shown in the figure above.

[2] TURN SIGNAL LIGHT

The turn signal light switch, which forms a combination switch with the head light switch and horn switch, has three positions; OFF, L and R. When using turn signal light switch, blinks only one side light and other one stays off.
Combination Switch
Combination switch consist of head light switch, turn signal light switch and horn switch.

---

### POSITION (PARKING) LIGHT

The position (parking) light switch is combined with the head light switch of the combination switch. The position lights are lighted up by the head light switch.
[5] BRAKE LIGHT

The brake lights are lighted up by brake switch. Current passes the circuit as shown in the figure above.

- **Brake Switch**
  
  Brake switch is turned on by pushing a brake pedal and turned off by releasing it.
  
  A : ON  
  B : OFF

[6] EASY CHECKER

To check the conditions of tractor easily before and during operation, easy checker combination of lamps on the easy checker board is provided.

- **Indication Items**
  
  1. **Oil Pressure Lamp**
     
     When the engine oil pressure is low, this lamp illuminates.
  
  2. **Charge Lamp**
     
     When the charging system is not functioning properly, this lamp illuminates.
  
  3. **Pre-heat Indicator Lamp**
     
     When the key switch is in the “Pre-heat” position, the pre-heat indicator lamp illuminates.

  ![Easy Checker Diagram](image)

- **Oil Pressure Switch**

  While oil pressure is high and the force applied to the diaphragm (2) is larger than the spring tension, the terminal contact (1) is open separated from the body contact (3). If the pressure drops below approx. 49 kPa (0.5 kgf/cm², 7.1 psi), the contact closes.

  ![Oil Pressure Switch Diagram](image)
The trailer socket is provided to take out the electrical power from tractor to trailer or implement.

The function of each terminal is shown below.

5. GAUGES

The fuel quantity and coolant temperature are indicated by the ammeters. The ammeters indicate each amperage flowing through the fuel level sensor for the fuel quantity detection and through the coolant temperature sensor for the coolant temperature detection.
[1] FUEL QUANTITY

■ Fuel Level Sensor
The remaining fuel quantity is detected by the fuel level sensor installed in the fuel tank and indicated on the fuel gauge. For detection, a float and a resistor are used. As the float (1) lowers, the resistance of the variable resistor (2) varies. The relation between the amount of fuel and the resistance is as follows.

<table>
<thead>
<tr>
<th></th>
<th>F</th>
<th>1/2</th>
<th>E</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1 to 5 Ω</td>
<td>27.5 to 37.5 Ω</td>
<td>103 to 117 Ω</td>
</tr>
</tbody>
</table>

(1) Float  (2) Variable Resistor

[2] COOLANT TEMPERATURE

■ Coolant Temperature Sensor
The coolant temperature sensor is installed to the cylinder head of the engine, and its tip is in contact with the coolant. It contains a thermistor (4) whose electrical resistance decreases as the temperature increases. Current varies with changes in the coolant temperature, and the increases or decreases in the current move the pointer of the gauge.

3. CHECKING, DISASSEMBLING AND SERVICING

[1] CHECKING AND ADJUSTING

⚠️ CAUTION

- To avoid accidental short circuit, be sure to attach the positive cable to the positive terminal before the negative cable is attached to the negative terminal.
- Never remove the battery cap while the engine is running.
- Keep electrolyte away from eyes, hands and clothes. If you are spattered with it, wash it away completely with water immediately.
- Keep open sparks and flames away from the battery at all times. Hydrogen gas mixed with oxygen becomes very explosive.

⚠️ IMPORTANT

- If the machine is to be operated for a short time without battery (using a slave battery for starting), use additional current (lights) while engine is running and insulate terminal of battery. If this advice is disregarded, damage to alternator and regulator may result.

(1) Battery

**Battery Voltage**

1. Stop the engine and turn the main switch **OFF**.
2. Connect the COM (-) lead of the voltmeter to the battery's negative terminal post and the (+) lead to the positive terminal post, and measure the battery voltage.
3. If the battery voltage is less than the factory specification, check the battery specific gravity and recharge the battery.

<table>
<thead>
<tr>
<th>Battery voltage</th>
<th>Factory spec.</th>
<th>More than 12 V</th>
</tr>
</thead>
</table>

(1) Battery

**Battery Terminal Connection**

1. Turn the main switch **ON**, and turn on the head light.
2. Measure the voltage with a voltmeter across the battery's positive terminal post and the cable terminal, and the voltage across the battery's negative terminal post and the chassis.
3. If the measurement exceeds the factory specification, clean the battery terminal posts and cable clamps, and tighten them firmly.

<table>
<thead>
<tr>
<th>Potential difference</th>
<th>Factory spec.</th>
<th>Less than 0.1 V</th>
</tr>
</thead>
</table>

W10126630
Battery Specific Gravity
1. Check the specific gravity of the electrolyte in each cell with a hydrometer.
2. When the electrolyte temperature differs from that at which the hydrometer was calibrated, correct the specific gravity reading following the formula mentioned in (Reference).
3. If the specific gravity is less than 1.215 (after it is corrected for temperature), charge or replace the battery.
4. If the specific gravity differs between any two cells by more than 0.05, replace the battery.

**NOTE**
- Hold the hydrometer tube vertical without removing it from the electrolyte.
- Do not suck too much electrolyte into the tube.
- Allow the float to move freely and hold the hydrometer at eye level.
- The hydrometer reading must be taken at the highest electrolyte level.

(Reference)
- Specific gravity slightly varies with temperature. To be exact, the specific gravity decreases by 0.0007 with an increase of 1 °C (0.0004 with an increase of 1 °F) in temperature, and increases by 0.0007 with a decrease of 1 °C (0.0004 with a decrease of 1 °F).

Therefore, using 20 °C (68 °F) as a reference, the specific gravity reading must be corrected by the following formula:
- Specific gravity at 20 °C = Measured value + 0.0007 × (electrolyte temperature − 20 °C)
- Specific gravity at 68 °F = Measured value + 0.0004 × (electrolyte temperature − 68 °F)

KiSC issued 03, 2007 A
(6) Starter

**Motor Test**

⚠ **CAUTION**
- Secure the starter to prevent it from jumping up and down while testing the motor.

1. Disconnect the battery negative cable from the battery.
2. Disconnect the battery positive cable and the leads from the starter M terminal.
3. Remove the starter from the engine.
4. Disconnect the connecting lead (2) from the starter C terminal (1).
5. Connect a jumper lead from the connecting lead (2) to the battery positive terminal post.
6. Connect a jumper lead momentarily between the starter motor housing and the battery negative terminal post.
7. If the motor does not run, check the motor.

(1) C Terminal (2) Connecting Lead

**Magnetic Switch Test**

1. Disconnect the battery negative cable from the battery.
2. Disconnect the battery positive cable and the leads from the starter M terminal.
3. Remove the starter from the engine.
4. Disconnect the connecting lead (3) from the starter C terminal (2).
5. Connect a jumper lead from the starter S terminal (1) to the battery positive terminal post.
6. Connect a jumper lead momentarily between the starter C terminal (2) and the battery negative terminal post.
7. If the pinion gear does not pop out, check the magnetic switch.

■ **NOTE**
- This test should be carried out for a short time, about 3 to 5 seconds.

(1) S Terminal (2) C Terminal (3) Connecting Lead

(7) Alternator

**Alternator No-load Voltage**

1. Disconnect the 2P connector (2) from the alternator.
2. Start the engine and keep the engine speed at approx. 2200 min⁻¹ (rpm).
3. Disconnect the battery negative cord from the battery.
4. Measure the voltage across the B terminal (1) and the chassis.
5. If the measurement is less than the factory specification, disassemble the alternator and check the IC regulator.

<table>

1. Set the hazard switch to the **ON** position, and make sure the hazard light gives 60 to 120 flashers for a minute.
2. Set the main switch to the **ON** position and move the turn signal switch to the left. Make sure the left-hand light gives flashes. Then move the turn signal switch to the right and make sure the right-hand light gives flashes. Make sure the same actions as above result.
3. If both the hazard switch and the turn signal switch and the turn signal switch function but the above actions do not take place, replace the flasher unit with new one.

(1) Flasher Unit

(2) Flasher Unit 13P Coupler
(11) Easy Checker

Easy Checker
1. Remove the panel board and disconnect the connector (1) from it.
2. Turn the main switch on.
3. Measure the voltage with a voltmeter across the terminal (Red / Yellow) and the earth terminal (Black).
4. If the voltage differs from the battery voltage, the wiring harness fuses and main switch should be checked.

(1) Connector

Engine Oil Pressure Switch, Panel Board and Wiring Harness
1. Disconnect the lead from the engine oil pressure switch (1) after turning the main switch OFF.
2. Turn the main switch ON and connect a jumper lead from the lead to the chassis.
3. If the engine oil pressure indicator lamp does not light, the panel board circuit or the wiring harness is faulty.

(1) Engine Oil Pressure Switch (a) From Oil Pressure Lamp

Engine Oil Pressure Switch Continuity
1. Measure the resistance with an ohmmeter across the switch terminal and the chassis.
2. If 0 Ω is not indicated in the normal state, the switch is faulty.
3. If infinity is not indicated at pressure over 4.9 kPa (0.5 kgf/cm², 7 psi), the switch is faulty.

<table>

### Fuel Gauge and Coolant Temperature Gauge Continuity

1. Remove the panel board from the tractor.
2. Check the continuity with an ohmmeter across the **U** terminal (2) and **IGN** terminal (3) and across the **U** terminal (2) and **GND** terminal (1).
3. If infinity is indicated, the coolant temperature is faulty.
4. Check the continuity with an ohmmeter across the **U** terminal (5) and **IGN** terminal (6) and across the **U** terminal (5) and **GND** terminal (4).
5. If infinity is indicated, the fuel gauge is faulty.

[Image: 3TBAAAQ9P068B]
[2] DISASSEMBLING AND ASSEMBLING

(1) Starter

1. Disconnect the connecting lead from the magnetic switch (3).
2. Remove the screw (1) and remove the magnetic switch (3).
3. Remove the screw (16) and through bolt (17), and separate the rear end frame (15).
4. Remove the brush holder (14).
5. Draw out the armature (13) and yoke (12).
6. Remove the gasket (11), gasket (19) and plate (18).
7. Draw out the shaft assembly (9) with the drive lever (5).

■ NOTE
- Do not damage the brush and commutator.
- Do not miss the ball (10).

(2) Alternator

Pulley
1. Secure the hexagonal end of the pulley shaft with a double-ended ratchet wrench as shown in the figure, loosen the pulley nut with a socket wrench and remove it.

(When reassembling)

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Pulley nut</th>

<td></td>
</tr>
</tbody>
</table>
Rear End Cover
1. Unscrew the three rear end cover screws and the B terminal nut, and remove the rear end cover.

Brush Holder
1. Unscrew the two screws holding the brush holder, and remove the brush holder (1).

IC Regulator
1. Unscrew the three screws holding the IC regulator, and remove the IC regulator (1).

Rectifier
1. Remove the four screws holding the rectifier and the stator lead wires.
2. Remove the rectifier (1).

Rear End Frame
1. Unscrew the two nuts and two screws holding the drive end frame and the rear end frame.
2. Remove the rear end frame (1).
**Rotor**

1. Press out the rotor (1) from drive end frame (3).

**IMPORTANT**

- Take special care not to drop the rotor and damage the slip ring or fan, etc..

(1) Rotor  
(2) Block  
(3) Drive End Frame  

**Retainer Plate**

1. Unscrew the four screws holding the retainer plate, and remove the retainer plate (1).

(1) Retainer Plate  

**Bearing on Drive End Side**

1. Press out the bearing from drive end frame (3) with a press and jig (1).

(1) Jig  
(2) Block  
(3) Drive End Frame  

**Bearing at Slip Ring Side**

1. Lightly secure the rotor (1) with a vise to prevent damage, and remove the bearing (2) with a puller (3).

(1) Rotor  
(2) Bearing  
(3) Puller

[3] SERVICING

(1) Starter

Commutator and Mica
1. Check the contact face of the commutator for wear, and grind the commutator with emery paper if it is slightly worn.
2. Measure the commutator O.D. with an outside micrometer at several points.
3. If the minimum O.D. is less than the allowable limit, correct the commutator on a lathe to the factory specification.
4. Measure the mica undercut.
5. If the undercut is less than the allowable limit, correct it with a saw blade and chamfer the segment edges.

<table>
<thead>
<tr>
<th>Commutator O.D.</th>
<th>Factory spec.</th>

</table>

(1) Segment  (2) Undercut  (3) Mica

(a) Correct  (b) Incorrect

Brush Wear
1. If the contact face of the brush is dirty or dusty, clean it with emery paper.
2. Measure the brush length A with vernier calipers.
3. If the length is less than the allowable limit, replace the yoke assembly and brush holder.

<table>
<thead>
<tr>
<th>Brush length (A)</th>
<th>Factory spec.</th>
<th>14.0 mm 0.551 in.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Allowable limit</td>
<td>9.0 mm 0.354 in.</td>
</tr>
</tbody>
</table>

Brush Holder
1. Check the continuity across the brush holder and the holder support with an ohmmeter.
2. If it conducts, replace the brush holder.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Brush holder - Holder support</th>
<th>Infinity</th>
</tr>
</thead>
</table>
Armature Coil
1. Check the continuity between the commutator and armature coil core with an ohmmeter.
2. If it conducts, replace the armature.
3. Check the continuity between the segments of the commutator with an ohmmeter.
4. If it does not conduct, replace the armature.

Bearing
1. Check the bearing for smooth rotation.
2. If it does not rotate smoothly, replace it.

Stator
1. Measure the resistance across each lead of the stator coil with an ohmmeter.
2. If the measurement is not within the factory specification, replace it.
3. Check the continuity across each stator coil lead and core with an ohmmeter.
4. If infinity is not indicated, replace it.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Factory spec.</th>
<th>Less than 1.0 Ω</th>
</tr>
</thead>
</table>

Rotor
1. Measure the resistance across the slip rings with an ohmmeter.
2. If the resistance is not the factory specification, replace it.
3. Check the continuity across the slip ring and core with an ohmmeter.
4. If infinity is not indicated, replace it.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Factory spec.</th>
<th>2.9 Ω</th>
</tr>
</thead>
</table>
Slip Ring
1. Check the slip ring for score.
2. If scored, correct with an emery paper or on a lathe.
3. Measure the O.D. of slip ring with vernier calipers.
4. If the measurement is less than the allowable limit, replace it.

| Slip ring O.D. | Factory spec. | 14.4 mm  
|               |               | 0.567 in. |
|               | Allowable limit | 12.8 mm  
|               |               | 0.504 in. |

Brush Wear
1. Measure the brush length with vernier calipers.
2. If the measurement is less than allowable limit, replace it.
3. Make sure that the brush moves smoothly.
4. If the brush is defective, replace it.

| Brush length | Factory spec. | 10.5 mm  
|             |               | 0.413 in. |
|             | Allowable limit | 8.4 mm  
|             |               | 0.331 in. |

Rectifier
1. Check the continuity across each diode of rectifier with an analog ohmmeter. Conduct the test in the (R × 1) setting.
2. The rectifier is normal if the diode in the rectifier conducts in one direction and does not conduct in the reverse direction.

■ IMPORTANT
- Do not use a 500 V megger for measuring because it will destroy the rectifier.

■ NOTE
- Do not use an auto digital multimeter. Because it’s very hard to check the continuity of rectifier by using it.

IC Regulator
1. Check the continuity across the B terminal and the F terminal of IC regulator with an analog ohmmeter. Conduct the test in the (R × 1) setting.
2. The IC regulator is normal if the IC regulator conducts in one direction and does not conduct in the reverse direction.

■ IMPORTANT
- Do not use a 500 V megger for measuring because it will destroy the IC regulator.

■ NOTE
- Do not use an auto digital multimeter. Because it’s very hard to check the continuity of IC regulator by using it.

(16) Air Conditioner Unit
(17) Door Air Outlet
The machine is equipped with a thin large-capacity air conditioner with outside air intake. Air pulled from the inside air filter (6) as well as the outside air filter (5), passes through the roof (7) and reaches the air conditioner unit (16). The air is then cooled and dehumidified by this unit.

The processed air is then heated to a comfortable level. In this way, the air being blown via the blow port can be kept at comfortable temperature and humidity.

The front air outlet (8) can be opened and closed using the center knob of each port. The side air outlet (9) are opened and closed using the mode lever on the control panel (4). With these ports opened or closed, you can feel your head cool and your feet warm.

NOTE
- As for the mechanism and function of each component part, refer to Workshop Manual of "MECHANISM".
- **Compressor Oil**
  The compressor oil dissolves in the refrigerant, circulates through the air-conditioning cycle, and performs the function of lubricating the compressor. The conventional compressor oil for R12 does not dissolve in R134a, so it does not circulate through the system, and the lifespan of the compressor is considerably shortened.

  It is essential to ensure that the correct refrigerant oil is used. R12 systems were lubricated with mineral oil, which is totally unsuitable for R134a systems. The system requires PAG oil, which mixes very well with the refrigerant and provides ideal lubrication throughout the system.

[3] AIR CONTROL VENT

■ Front Air Outlet

The front air outlets can be independently adjusted as required. To defrost the windshield, rotate the outlets toward the windshield.

(1) Front Air Outlet
  (A) Windshield
  (B) Closed
  (C) Chest Area

W1014792

■ Side Air Outlet and Door Air Outlet

The side and door air outlets can be adjusted to direct air on to the operator, door window or the rear of the CAB.

■ NOTE
  • If the airflow rate at the face is too low, close the front air outlet.

(1) Side Air Outlet  (2) Door Air Outlet

W1014957

■ Recirculation / Fresh Air Selection Lever

[FRESH AIR]

Set the lever to the B position (FRESH AIR), and fresh air will flow into the CAB. This is helpful when you work in dusty conditions or if the glass windows get foggy.

[RECIRCULATION]

Set the lever to the A position (RECIRCULATION), and the in-CAB air will be recirculated. This is useful for cooling or heating the CAB quickly or keeping it extra cool or warm.

■ NOTE
  • When heating, do not keep the lever at the "RECIRCULATION" position for a long time. The windshield easily gets foggy.
  • While working in a dusty conditions, keep the lever at the "FRESH AIR" position. This increase the pressure in the CAB, which helps prevent dust from coming into the CAB.

(1) Recirculation / Fresh Air Selection Lever
  A : RECIRCULATION
  B : AIR FRESH

W1015121
[4] CONTROL PANEL

- **Mode Lever**
  
  Set the mode lever to the desired position.
  
a: Air is blown from the front and side air outlets.
b: Air is blown from only the front air outlets.

- **Temperature Control Lever**
  
  Set this lever at the desired position to obtain the optimum air temperature. Move the lever to the right to obtain warmer air. Move it to the left to obtain cooler air.

- **Blower Switch**
  
  Air volume can be changed in three steps. At the "HI" position, the largest air volume is obtained.

- **Air Conditioner Switch**
  
  Push this switch to activate the air conditioner. An indicator light will light up when the switch is set to "ON". Push switch again to turn air conditioner off, in which case the indicator light will be off.

[5] OPERATION

- Heating
  1. Set the mode lever to the a position or b position.
  2. Set the recirculation / fresh air selection lever to the "FRESH AIR" position. To raise the temperature in the CAB quickly, set this lever to the "RECIRCULATION" position.
  3. Adjust the blower (LO / ME / HI) switch and the temperature control lever to achieve a comfortable temperature level.

(B) Foot Area
(C) Closed

a : Front and Side Air Outlet Position
b : Front Air Outlet Position
Cooling or Dehumidifying-heating
1. Set the mode lever to the a position.
2. Rotate the front air outlet toward the chest area.
3. Set the recirculation / fresh air selection lever to the "FRESH AIR" position. To reduce the temperature in the CAB quickly, set this lever to the "RECIRCULATION" position.
4. Press and turn on the air-conditioner switch with indicator.
5. Turn on the blower (LO / ME / HI) switch.
6. Adjust the temperature control lever to the "COOL" or an intermediate position to achieve a comfortable temperature level.

**NOTE**
- In summer when the heater is not used, keep the temperature control lever at the "COOL" (leftmost) position. Otherwise, hot air will raise the temperature in the CAB.
■ Foot Warming and Head Cooling

1. Set the mode lever to the a position.
2. In the cooling or dehumidifying-heating mode, set the temperature control lever at the center position.
3. Open the front air outlet and direct it to your feet.
4. You can feel your head cool and your feet warm.

2. REFRIGERATION SYSTEM

1. The gaseous refrigerant passes through the evaporator (4) and the compressor (3) at approx. 1.47 MPa (15 kgf/cm², 213 psi) and is also raised in temperature to approx. 70 °C (158 °F) before being delivered to the condenser (11).

2. The gaseous refrigerant is cooled down through the condenser (11) to approx. 50 °C (122 °F) and delivered to the receiver (10) in the liquid state. At this time, heat removed from the cabin interior is extracted by means of the condenser (11).

3. The liquid refrigerant is collected in the receiver (10) for a certain period. At this time, moisture is removed from the refrigerant by desiccant (9).

4. The liquid refrigerant after removing moisture and dust, is jetted out of the small hole of the expansion valve (7) into the evaporator (4), as if it were distributed by an atomizer. Thus, the refrigerant is reduced in both pressure and temperature, and to ease evaporation.

5. The refrigerant vigorously evaporates at 0 °C (32 °F), taking heat from the surface of the pipes in the evaporator (4). At this time, warm air in a cabin is drawn into the evaporator (4) by the blower motor and is passed over those pipes, transferring its heat to the refrigerant for evaporation. The cooled air is then distributed to the cabin and the heat in the cabin is taken by the evaporator.

(Reference)

- Since warm air in the cabin is cooled suddenly, water in the air is liquefied and removed, which means dehumidification is also performed.

7. The gaseous refrigerant from the evaporator (4) after having performed the cooling action is returned to the compressor (3), and is compressed to liquefy it (high pressure and high temperature). This cycle is repeated.

8. The air coming from the evaporator is fed to the air mixing doors, by which part of the air is introduced into the heater core (1). In doing so, the air temperature can be adjusted to a comfortable level.
[1] COMPRESSOR

The compressor is installed on the engine and is driven by the crank pulley via a belt. The compressor is a pump designed to raise the pressure of refrigerant. Raising the pressure means raising the temperature. High temperature refrigerant vapor will condense rapidly in the condenser by releasing heat to the surrounding.

(1) Scroll Type Compressor

The scroll type compressor is composed of a pair of swirl shaped fixed scroll (3) and movable scroll (2). The fixed scroll (3) is fixed to the housing, and movable scroll (2) rotates with the shaft (8). Therefore, the capacity of the space partitioned with both scroll changes. As a result, the refrigerant is inhaled and compressed.

| (1) Bearing | (6) Discharge Port |
| (2) Movable Scroll | (7) Bearing |
| (3) Fixed Scroll | (8) Shaft |
| (4) Service Valve for High Pressure | (9) Shaft Seal |

Operation

When the capacity between fixed scroll (4) increases with the rotational movement of the movable scroll (2), the refrigerant is inhaled from the suction port (1). In addition, the refrigerant is compressed by the rotational movement of movable scroll (2).

When the refrigerant pressure rises, the discharge valve is pushed open and the refrigerant gas is discharged. In this way, the refrigerant gas is discharged once in each rotation of the compressor shaft.

| (1) Suction Port | A : Suction Stroke |
| (2) Movable Scroll | B : Compression Stroke |
| (3) Discharge Port | C : Discharge Stroke |
| (4) Fixed Scroll |
(2) Pressure Relief Valve

If the high pressure is abnormally high, the pressure relief valve (1) opens to protect the circuit.
Even in the worst case, the outflow of refrigerant is stopped at the minimum limit.

(Reference)
- In normal operation, the high pressure switch is triggered first and the compressor stops, so the pressure relief valve is not triggered so easily.

(1) Pressure Relief Valve        (2) Compressor

W1018832
(3) Magnetic Clutch

A magnetic clutch is used to engage and disengage the compressor from the engine. Main components are stator (6), rotor with pulley (5), and pressure plate (1) to engage the drive pulley (4) and compressor (8) magnetically.

The stator is fixed on the compressor housing, and the pressure plate (1) is attached to the compressor shaft. Two ball bearings (2) are used between the inner surface of the rotor and the front housing of the compressor.

(1) Pressure Plate  (5) Rotor with Pulley
(2) Ball Bearing    (6) Stator
(3) Snap Ring       (7) Snap Ring
(4) Pulley          (8) Compressor

KiSC issued 03, 2007 A
The condenser (1) is installed in the front of the radiator to enable forced cooling by the air drawn in by the engine radiator fan.

The condenser is used for the purpose of cooling by robbing the heat from the refrigerant gas, which has been compressed by the compressor into high temperature, high pressure gas, and change this gas into liquid refrigerant.

The heat given off by the gaseous refrigerant in the condenser is the sum of the heat absorbed at the evaporator and the heat of work required by the compressor to compress the refrigerant. The greater the amount of heat is given off in the condenser, the greater the cooling effect attainable by the evaporator in the cabin.

(1) Condenser  a: Gaseous Refrigerant
(2) Radiator  b: Liquid Refrigerant
(3) Tube  c: Heated Vapor from Compressor
(4) Fin  (70 °C, 158 °F)
(5) Vapor  d: Cooled Liquid to Receiver
(6) Liquefying  (50 °C, 122 °F)
(7) Liquefied
The receiver serves the purpose of storing the liquid refrigerant. The amount of liquid refrigerant flowing through the system varies with the operating condition of the air conditioner. To be accurate, the receiver stores excess refrigerant when the heat load is lowered. It also releases stored refrigerant when additional cooling is needed, thus, maintaining the optimum flow of refrigerant within the system.

The receiver includes a desiccant (2). It has the job of removing moisture as the refrigerant circulates within the system.

The sight glass is installed on the top of the receiver. The amount of refrigerant that is charged has a direct effect on the efficiency of the air conditioner. The sight glass is used to check the amount of refrigerant. If a large flow of bubbles can be seen in the sight glass, there is insufficient refrigerant charged. If so, replenish the refrigerant to the proper level.

(1) Receiver Body  a : IN
(2) Desiccant b : OUT

W1027972
[4] AIR CONDITIONER UNIT

The air conditioner unit (1) consists of evaporator (3), expansion valve (2), heater core (4), blower (5), etc.

(1) Air Conditioner Unit  (4) Heater Core
(2) Expansion Valve      (5) Blower
(3) Evaporator
The expansion valve restricts the flow of liquid refrigerant and delivers sprayed refrigerant to the evaporator to facilitate refrigerant evaporation.

The cabin interior will not be cooled sufficiently if the expansion valve outlet is too small. If it is too wide, frost will be produced on the evaporator, decreasing cooling efficiency. Thus the size of this small spray hole has to be controlled according to various conditions.

1. Pipe
2. Expansion Valve
3. Evaporator
4. Diaphragm Chamber
5. Diaphragm
6. Needle Valve
7. Adjusting Screw
8. Pressure Spring
9. Tube
10. Heat Sensitive Tube
11. Capillary Tube

a: From Receiver
b: To Evaporator
c: From Evaporator
When the vapor pressure of the operating system is stable, \( Pf = Pe + Ps \) condition will prevail. At this time the needle valve opening will be stationary and constant refrigerant flow will be maintained.

If the evaporator installing expansion valve, the refrigerant in the outlet is always in superheated vapor form for certain length (part B in the figure). If the cooling load increases (inlet air temperature of evaporator becomes high), the refrigerant will vaporize faster and cause the length of the superheated vapor part B to become longer. Thus, the pressure in the heat sensitive tube (7) rises and increases the needle valve opening, resulting in larger flow of the refrigerant into the evaporator. Conversely, if the amount of refrigerant in the evaporator increases, the length of the superheated vapor part B will become shorter. The pressure in the heat sensitizing tube will drop and decrease the needle valve (2) opening.

- (1) Diaphragm
- (2) Needle Valve
- (3) Refrigerant Inlet
- (4) Spring
- (5) Adjusting Screw
- (6) Evaporator Tube
- (7) Heat Sensitive Tube
- (8) Capillary Tube

A : Saturated Vapor Part
B : Superheated Vapor Part

\( Pf \) : Gas pressure in sensitizing tube
\( Ps \) : Spring pressure
\( Pe \) : Vapor pressure in evaporator
The purpose of the evaporator (1) is just opposite to that of the condenser. The state of refrigerant immediately after the expansion valve is 100 % liquid. As soon as the liquid pressure drops, it starts to boil, and in doing so, absorbs heat. This heat is removed from the air passing over the cooling fins of the evaporator and causes the air to cool.

If too much refrigerant is sent into the evaporator, it will not boil as easily. If the evaporator is filled with liquid refrigerant, it eliminates a place for the refrigerant to properly vaporize. This vaporization is necessary in order to absorb heat. A flooding condition of the evaporator will allow an excess of liquid refrigerant to leave the evaporator and may cause serious damage to the compressor.

If too little refrigerant is sent into the evaporator, again the evaporator will not cool because the refrigerant will vaporize, or boil off, long before it passes through the evaporator.

Refrigerant properly metered into the evaporator should allow for 100 % liquid just after the expansion valve, and 100 % gas at the outlet.

The heater utilizes the heater core to absorb heat from the coolant, which has removed heat from the engine. The inlet port of heater core is connected to the delivery side of the engine water pump by a rubber hose. The water valve is installed on the inlet port of the heater core. Also, the outlet port of the heater core is connected to the engine cylinder block.

The heater core is a heat exchanger, like the evaporator or condenser. Heat is exchanged between heated coolant passing through the core and air in the cabin or fresh outdoor air. The cab air is heated through this process.
(4) Water Valve

The water valve (3) is connected to the temperature control lever (8) by a linkage. The valve in the water valve (3) is opened or closed by the temperature control lever (8).

- (8) Temperature Control Lever

A : Water Flow

W1021257
(5) Blower

The blower unit is installed on the right side of the air conditioner unit. The blower serves to force cooling air, hot air or fresh outside air into the cabin through the 7 outlets.

The blower motor used is a ferrite type and its speed is controlled by resistors in 3 steps.

The fan used is a centrifugal type. In this type of fan, the air is drawn in parallel to the rotating axis and is blown out perpendicular to the rotating axis, that is in the direction of the centrifugal force.

(1) Blower Switch  (2) Air Conditioner Switch  (3) Air Mode Lever  (4) Temperature Control Lever  (5) Blower
3. SYSTEM CONTROL

1) Selection of recirculated air (7) or fresh air (5) is done with door D1.

- **RECIRC**
  By setting the air selection lever (16) in rear control panel to *RECIRC* position, door D1 (6) shuts the fresh air inlet port. Air inside the cabin is then recirculated.

- **FRESH**
  By moving the air selection lever (16) to *FRESH* position, door D1 opens the fresh air inlet port. Outside air comes into cabin.

2) Temperature control of outlet air is done with door D2.

- **COOL**
  By setting the temperature control lever (4) in control panel to *COOL* position, door D2 (10) is moved to close water valve. The air flows to door D3 (12) side without passing the heater core.

- **WARM**
  By moving the temperature lever to *WARM* position door D2 is moved to open the water valve. The air flows to door D3 (12) side passing through the heater core.

3) Outlet air flow is controlled by door D3.

- Moving the air mode lever (1) opens and shuts door D3 and establishes the air passage according to the lever position.

- **DEF + FACE**
  By moving the mode lever to *DEF + FACE* position, the door D3 is moved to establish the air passages to outlets O1, O2 and O3. Air comes out from both outlets.

- **DEF**
  Moving the mode lever to *DEF* position, door D3 is moved to set up the air passage to outlet O1. Air comes out from outlet O1.
4. ELECTRICAL SYSTEM

[1] ELECTRICAL CIRCUIT

The process of the magnetic clutch being engaged is shown below.

Main Switch (3) ON → A/C Switch (9) ON → Blower Switch (9) ON (Low, medium or high) → Compressor Relay Contact (5) → Thermostat (Thermo Switch) (7) ON (the thermostat temperature is more than 4 °C (39.2 °F)) → Pressure Switch (5) ON (if refrigerant pressure is between 0.196 MPa (2.0 kgf/cm², 28.4 psi) and 2.94 MPa (30.0 kgf/cm², 426 psi) → Compressor Magnet Clutch (6) engaged.
[2] BLOWER RELAY, COMPRESSOR RELAY, THERMO SWITCH AND PRESSURE SWITCH

Remove the inner roof and the relays are visible at the left side pillar of the cabin ceiling: blower relay (1) and compressor relay (2). When the blower fan is adjusted for the air flow rate, the blower relay (1) is activated by a signal from the fan switch on the control panel.

Among the air conditioner components, current flows to the blower motor (7) and magnetic clutch. If all of these current were to be passed through the main switch (5) and supplied, the current would be too large for the main switch (5). This could cause the main switch to burn out. If the current were to be passed directly from the battery (3), forgetting to turn off the blower motor (7) could result in a discharged battery (3).

To protect against such trouble, relays have been provided. These relays have been made so that when current flows through its coil, the contacts close to supply the power from the battery (3). By employing these relays, the current flowing through the main switch (5) has been decreased as only a small current is required to actuate the relay. Thus there will be no danger of burning out the switch contact, and when the main switch (5) is opened, the relay contact will open at the same time. This action stops the current flow in the air conditioner circuit so that there will also be no chance of the battery discharging.

(1) A/C Blower Relay  (6) A/C Blower Switch
(2) Compressor Relay  (7) A/C Blower Motor
(3) Battery  (8) A/C Blower Resistor
(4) Slow Blow Fuse  (9) Thermo Switch
(5) Main Switch  (10) Pressure Switch
Among the air conditioner components, current flows to the blower motor and magnetic clutch. If all of these current were to be passed through the main switch and supplied, the current would be too large for the main switch so that there will be danger or burning out the main switch contact. If the current were to be passed directly from the battery, forgetting to turn off the blower motor could result in a discharged battery.

To protect against such trouble, a relay has been provided. This relay has been made so that when current flows through its coil, the contacts close to supply the power from the battery. By employing this relay, the current flowing through the main switch has been decreased as only a small current is required to actuate the relay. Thus there will be no danger of burning out the switch contact, and when the main switch is opened, the relay contact will open at the same time. This action stops the current flow in the air conditioner circuit so that there will also be no chance of the battery discharging.

\[ a : \text{To compressor magnet clutch} \]  
\[ b : \text{To A/C blower switch} \]  
\[ c : \text{To A/C blower motor} \]
(2) Blower Switch

The output of the blower can be used in 3 positions (Low, Medium, High) by changing the blower switch position.

- **Blower Switch is "OFF" position**
  When the blower switch is in "OFF" position, even if the main switch is turned to "ON" position, air conditioner relay does not operate.

(1) Battery  (9) A/C Blower Motor
(2) Slow Blow Fuse  (10) A/C Blower Resister
(3) Main Switch  a: To compressor magnet switch
(4) Compressor Relay  b: To tractor body
(5) Thermo Switch
(6) Pressure Switch
(7) A/C Blower Switch
(8) A/C Blower Relay
If the evaporator fin temperature, that is the refrigerant vaporizing temperature, drops below 0 °C (32 °F), frost or ice will form on the fins, causing a decrease in air flow and lowering the cooling capacity. To prevent such frosting, and to allow the setting of the cabin interior to the desired temperature, a thermostat has been installed.

In this system, a gas type thermo switch is used. The gas type thermo switch has a capillary tube which is filled with special gas. The capillary tube is connected to the diaphragm chamber. The tip of the capillary tube is positioned on the evaporator fins.

When the evaporator fins temperature is higher than the setting temperature of the thermostat, the micro switch in the thermo switch is turned "ON" by increasing the pressure in the diaphragm chamber. When the evaporator fins temperature is low, such as in the winter season, the micro switch is turned "OFF" because of the pressure in the diaphragm chamber and spring tension drops, thus turning "OFF" the magnetic clutch to prevent the evaporator from frosting.

(Reference)
- Thermo switch (thermostat) setting temperature
  OFF .......... Approx. 1 °C (34 °F)
  ON .......... Approx. 4.5 °C (40.1 °F)

(2) Capillary Tube  b : From A/C switch
(3) Evaporator
(4) Diaphragm
(5) A/C Blower Resister
(6) Thermo Switch
(4) Pressure Switch

The pressure switch detects the pressure in the refrigerant cycle, and when something is wrong, turns off the magnetic clutch to prevent the component from damage. This system has a dual type pressure switch, and this switch controls low pressure cut off and high pressure cut off.

■ Pressure Switch (Dual Type)

The pressure switch is installed in the inlet line (liquid line) between the receiver and expansion valve.

The contact of pressure switch is normally an open type.

(1) Receiver (2) Pressure Switch

W1028710
**OFF Position : A (When the refrigerant pressure is low)**

The pressure switch detects the pressure drop when the refrigerant leaks from the system causing compressor seizure. When pressure of refrigerant is less than specified pressure the switch turns OFF and disengages magnetic clutch.

**NO Position : B (When the refrigerant pressure is normally)**

When the pressure in the inlet line is between 0.196 MPa (2.0 kgf/cm², 28.4 psi) and 3.14 MPa (32 kgf/cm², 455 psi), the switch is turned ON (the pressure is normal condition), and engages magnetic clutch.

**OFF Position : C (When the refrigerant pressure is high)**

When the pressure in the inlet line is higher than specified pressure, the switch is turned OFF, and disengages magnetic clutch.

(Reference)

4. PRECAUTIONS AT REPAIRING REFRIGERANT CYCLE

When checking or repairing the air conditioning system, the following precautions and rules must be observed. And it is of first importance that no other personnel than a well-trained serviceman should be allow to handle the refrigerant.

⚠️ CAUTION

- Since direct contact of the liquid refrigerant with your skin will cause frostbite, always be careful when handling the refrigerant. Always wear goggles to protect your eyes when working around the system.
- The refrigerant service container has a safe strength. However, if handled incorrectly, it will explode. Therefore, always follow the instructions on the label. In particular, never heat the refrigerant container above 40 °C (104 °F) or drop it from a high height.
- Do not steam clean on the system, especially condenser since excessively high pressure will build up in the system, resulting in explosion of the system.
- If you improperly connect the hose between the service valve of compressor and gauge manifold, or incorrectly handle the valves, the refrigerant service container or charging hose will explode. When connecting the hose or handling the valve, be sure to check the high pressure side or low pressure side.
- In case the refrigerant is charged while the compressor is operated, do not open the high pressure valve of the gauge manifold.
- Beware of the toxicity of the gas. The gas is harmless and nontoxic in its original state, however it produces a toxic substance when it comes in contact with high temperature parts and decomposes.
- Do not heat the service can unless necessary. When it has to be heated, use warm water of 40 °C (104 °F) or lower. Do not heat using boiling water.

■ IMPORTANT

- If the refrigerant, O-rings, etc. for R12 are used in the R134a air conditioner system, problems such as refrigerant leakage or cloudiness in the sight glass may occur. Therefore, in order to prevent charging of refrigerant or erroneous connections, the shapes of the piping joint as well as the shapes of the service valve and the service tools have been changed.
- Always keep the working place clean and dry and free from dirt and dust. Wipe off water from the line fittings with a clean cloth before disconnecting.
- Use only for R134a refrigerant service tool.
- Use for R134a refrigerant recovery and recycling machine when discharging the refrigerant.
- Before attaching the charging hose to the can tap valve of the refrigerant container, check each packing for clogging.
- When disconnecting the charging hose from the charging valve of compressor and receiver, remove it as quick as possible so that gas leakage can be minimized.
- Be sure to charge the specified amount of refrigerant, but not excessively. Over-charging of the refrigerant in particular may cause insufficient cooling, etc..<br>• Since the charging hose can be connected to can tap valve by hand, do not use a pliers for tightening it.<br>• Keep refrigerant containers in a cool and dark place avoiding such place which are subject to strong sunlight or high temperature.<br>• R134a compressor oil absorbs moisture easily, so that be sure to seal after disconnecting the each parts.<br>• Do not use old-type refrigerant R12a or compressor oil for old-type refrigerant.<br>• When replacing the condenser, evaporator and receiver, etc., replenish the compressor oil to compressor according to the table below.
[1] HANDLING OF SERVICE TOOLS

(1) Manifold Gauge Set

The hand valves on the manifold gauge set are used to open and close the valve. The hand valve inscribed LO is for the low pressure side valve (3) and HI is for the high pressure side valve (4). By opening or closing the high and low pressure hand valves, the following circuits are established.

*PAG : Polyalkyleneglycol (Synthetic oil)

■ When LO Pressure Side Valve and HI Pressure Side Valve are Closed
  Two circuits are established.
  Port (C) → LO pressure gauge (1)
  Port (A) → HI pressure gauge (2)

■ NOTE
  • Schrader valve (D) must be opened.

■ When LO Valve is Opened and HI Valve is Closed
  Two circuits are established.
  Port (C) → LO pressure gauge (1)
  → Port (B)
  → Port (D)
  Port (A) → HI pressure gauge (2)

■ NOTE
  • Schrader valve (D) must be opened.
When LO Valve is Closed and HI Valve is Opened
Two circuits are established.
Port (C) → HI pressure gauge (2)
  → Port (B)
  → Port (D) (Schrader valve must be opened)
Port (A) → LO pressure gauge (1)

**NOTE**
- Schrader valve (D) must be opened.

When LO and HI Valve is Opened
Two circuits are established.
Port (A) → HI pressure gauge (2)
  → LO pressure gauge (1)
  → Port (B)
  → Port (C)
  → Port (D) (Schrader valve must be opened)

**NOTE**
- Schrader valve (D) must be opened.
(2) Refrigerant Charging Hose

The charging hoses are classified into three colors. Each charging hose must be handled as follows:

- The air conditioner manufacture recommends that the blue hose (3) is used for the LO pressure side (suction side), the green hose (5) for refrigeration side (center connecting port) and the red hose (4) for HI pressure side (discharged side).

(When connecting)
- Push the quick disconnect adaptor (6) into the charging valve, and push on part A until a click is heard.

**NOTE**
- When connecting, push carefully so the pipe doesn't bend.
- When connecting the quick disconnect connector, should the sleeve (7) move before the quick link connector can be connected to the charging valve, move the quick sleeve to its original position and try again.
- When some refrigerant remains in the charging hose at the time of connections, it may be difficult to connect the quick link connector. In this case, perform the operation after removing any residual pressure in the hose. (Remove the residual pressure by pushing the pusher (8).)

(When reassembling)
- While holding on to part A of the quick disconnect adaptor, slide part B up.

**NOTE**
- After removing the adaptor, ensure to cap the quick disconnect adaptor service valve.

| (1) LO Pressure Side Valve | (7) Sleeve |
| (2) HI Pressure Side Valve | (8) Pusher |
| (3) Blue Hose | (9) Sleeve |
| (4) Red Hose |
| (5) Green Hose |
| (6) Quick Disconnect Adaptor |

\[a : \text{CLICK}\]
(3) Vacuum Pump Adaptor

Objective of the Vacuum Pump Adaptor

1. After vacuum has been created in the air conditioning cycle, when the vacuum pump is stopped, since there is vacuum in hoses within the gauge manifold, the vacuum pump oil flows back into the charging hose. If the refrigerant is refilled with the system still in this state, the vacuum pump oil left in the charging hose enters the air conditioner cycle together with the refrigerant. Vacuum pump adaptor with a solenoid valve is used to prevent this back-flow of oil from the vacuum pump. The role of the solenoid valve is that when the current passes through the solenoid valve, the valve closes to keep out the outside air and allow the vacuum to build up, but when the current stops, the valve opens to allow in air and end the vacuum.

2. Attaching this adaptor to the R12 vacuum pump currently being used allows the pump to be used with both R134a and R12.

(4) Electric Gas Leak Tester

The current R12 gas leak tester has poor sensitivity for R134a and cannot be used. Therefore, a new electric gas leak tester with greater sensitivity has been designed and can be used with both R134a and R12.

(Reference)

- Leak tester with halide torch
  - Since the reaction with chlorine within the refrigerant is used to detect gas leaks, R134a, which contains no chlorine, cannot be detected.
(5) Can Tap Valve

The can tap valve that is used to charge the refrigerant into the air conditioning system, should be used as follows:

1. Before putting the can tap valve on the refrigerant container, turn the handle (1) counterclockwise till the valve needle is fully retracted.
2. Turn the plate nut (disc) (4) counterclockwise till it reaches its highest position, then screw down the can tap valve into the sealed tap.
3. Turn the place nut clockwise fully, and fix the center charging hose to the valve.
4. Tighten the place nut firmly by hand.
5. Turn the handle (1) clockwise, thus making a hole in the sealed tap.
6. To charge the refrigerant into the system, turn the handle (1) counterclockwise. To stop charging, turn it clockwise.

(1) Butterfly Handle (3) Needle
(2) Connection (4) Disc

W1024236

(6) T-joint

T-joint (2) is used to increase efficiency of gas charging using two refrigerant containers (4) at a time.

1. Install two refrigerant container service valves to T-joint (2) sides and connect the charging hose (1) to it.

(1) Charging Hose (Green) (3) Can Tap Valve
(2) T-joint (4) Refrigerant Container

W1026583

(7) R134a Refrigerant Recovery and Recycling Machine

When there is necessity of discharging the refrigerant on repairing the tractor, it should use recovery and recycling machine. (Don't release the refrigerant into the atmosphere.)

■ IMPORTANT
• Use only R134a refrigerant recovery and recycling machine, eliminate mixing R134a equipment, refrigerant and refrigerant oils with R12 systems to prevent compressor damage.

W1026968
5. CHECKING AND CHARGING REFRIGERANT CYCLE

[1] CHECKING WITH MANIFOLD GAUGE

■ IMPORTANT
- The gauge indications described in the following testing are those taken under the same condition, so it should be noted that the gauge readings will differ somewhat with the ambient conditions.

Condition
- Ambient temperature: 30 to 35°C (86 to 95°F)
- Engine speed: Approx. 1500 min\(^{-1}\) (rpm)
- Temperature control lever: Maximum cooling position
- Blower switch: HI position

Manifold Gauge Connecting and Test Preparation
1. Close the manifold gauge HI and LO pressure side valve (7), (6) tightly.
2. Connect the charging hose (1) (red) to the HI pressure side charging valve (2) and connect the charging hose (4) (blue) to the LO pressure side charging valve (3).

■ NOTE
- Be sure to drive out the air in the charging hoses at the manifold gauge connection end by utilizing the refrigerant pressure in the refrigerating cycle.
3. Start the engine and set at approx. 1500 min\(^{-1}\) (rpm).
4. Turn on the A/C switch and set the temperature control dial to maximum cooling position "C".
5. Set the blower switch to HI position "B".

W1027202
**Normal Operating**

If the refrigerating cycle is operating normally, the reading at the **LO** pressure side (1) should be generally by around 0.15 to 0.2 MPa (1.5 to 2.0 kgf/cm², 21 to 28 psi) and that at the **HI** pressure side (2) around 1.27 to 1.66 MPa (13 to 17 kgf/cm², 185 to 242 psi).

(1) **LO** Pressure Side  
(2) **HI** Pressure Side

**Insufficient Refrigerant**

1. Symptoms seen in refrigerating cycle
   - Both **LO** and **HI** pressure side (1), (2) pressures too low.
     - **LO** pressure side (1): 0.05 to 0.1 MPa  
       (0.5 to 1.0 kgf/cm², 7.1 to 14.2 psi)
     - **HI** pressure side (2): 0.69 to 0.98 MPa  
       (7 to 10 kgf/cm², 99.6 to 142.2 psi)
   - Bubbles seen in sight glass.
   - Air discharged from air conditioner slightly cold.
2. Probable cause
   - Gas leaking from some place in refrigerant cycle.
3. Solution
   - Check for leakage with electric gas leak tester and repair.
   - Recharge refrigerant to the proper level. (See page 10-S23.)

(1) **LO** Pressure Side  
(2) **HI** Pressure Side
Excessive Refrigerant or Insufficient Condenser Cooling

1. Symptoms seen in refrigerating cycle
   • Both LO and HI pressure side (1), (2) pressures too high.
     LO pressure side (1) : 0.2 to 0.35 MPa  
     (2.0 to 3.5 kgf/cm², 28 to 49.8 psi)
     HI pressure side (2) : 1.96 to 2.45 MPa  
     (20 to 25 kgf/cm², 284.5 to 355.6 psi)

2. Probable cause
   • Overcharging refrigerant into cycle.
   • Condenser cooling faulty.

3. Solution
   • Clean condenser. (See page G-12.)
   • Adjust air conditioner belt to proper tension. (See page G-26.)
   • If the above two items are in normal condition, check refrigerant quantity. (See page 10-S23.)

■ NOTE
   • If excessive refrigerant is to be discharged, loosen manifold gauge LO pressure side valve and vent out slowly.

Air Entered in the Cycle

1. Symptoms seen in refrigerating cycle
   • Both LO and HI pressure side (1), (2) pressures too high.
     LO pressure side (1) : 0.2 to 0.35 MPa  
     (2.0 to 3.5 kgf/cm², 28 to 49.8 psi)
     HI pressure side (2) : 1.96 to 2.45 MPa  
     (20 to 25 kgf/cm², 284.5 to 355.6 psi)
   • LO pressure side (1) piping not cold when touched.

2. Probable cause
   • Air entered in refrigerating cycle.

3. Solution
   • Replace receiver.
   • Check compressor oil contamination and quantity.
   • Evacuate and recharge new refrigerant. (See page 10-S21.)

■ NOTE
   • The above cycle can be seen when the cycle is charged without evacuation.
**Moisture Entered in the Cycle**
1. Symptoms seen in refrigerating cycle
   - The air conditioner operates normally at the beginning, but over time, **LO** pressure side (1) pressure is vacuum and **HI** pressure side (2) is low pressure.
   - **LO** pressure side (1) : Vacuum
   - **HI** pressure side (2) : 0.69 to 0.98 MPa
     (7 to 10 kgf/cm², 99.6 to 142.2 psi)
2. Probable cause
   - The moisture in the refrigerating cycle freezes in the expansion valve orifice and causes temporary blocking. After a time, the ice melts and condition returns to normal.
3. Solution
   - Replace receiver.
   - Remove moisture in cycle by means of repeated evacuation.
   - Recharge new refrigerant to the proper level.
     (See page 10-S23.)

**Refrigerant Fails to Circulate**
1. Symptoms seen in refrigerating cycle
   - **LO** pressure side (1) pressure is vacuum and, **HI** pressure side (2) is low pressure.
   - **LO** pressure side (1) : Vacuum
   - **HI** pressure side (2) : 0.49 to 0.59 MPa
     (5 to 6 kgf/cm², 71.2 to 85.3 psi)
2. Probable cause
   - Refrigerant flow obstructed by moisture or dirt in the refrigerating cycle freezing or sticking on the expansion valve orifice.
3. Solution
   - Allow to stand for same time and then resume operation to decide whether the plugging is due to moisture or dirt.
   - If caused by moisture, correct by referring to instructions in previous.
   - If caused by dirt, remove the expansion valve and blow out the dirt with compressed air.
   - If unable to remove the dirt, replace the expansion valve.
   - Replace the receiver. Evacuate and charge in proper amount of new refrigerant. (See page 10-S23.)
   - If caused by gas leakage in heat sensitizing tube, replace the expansion valve.

(1) **LO** Pressure Side  (2) **HI** Pressure Side
Expansion Valve Opens Too Far or Improper Installation of Heat Sensitizing Tube

1. Symptoms seen in refrigerating cycle
   - Both LO and HI pressure side (1), (2) pressures too high.
     - LO pressure side (1) : 0.29 to 0.39 MPa
       (3.0 to 4.0 kgf/cm², 42.71 to 56.9 psi)
     - HI pressure side (2) : 1.96 to 2.45 MPa
       (20 to 25 kgf/cm², 284.5 to 355.6 psi)
   - Frost or heavy dew on low pressure side piping.

2. Probable cause
   - Expansion valve trouble or heat sensitizing tube improperly installed.
   - Flow adjustment not properly done.

3. Solution
   - Check installed condition of heat sensitizing tube.
   - If installation of heat sensitizing tube is correct, replace the expansion valve.

Faulty Compression of Compressor

1. Symptoms seen in refrigerating cycle
   - LO pressure side (1) : 0.39 to 0.59 MPa (4 to 6 kgf/cm², 56.9 to 85.3 psi)
   - HI pressure side (2) : 0.69 to 0.98 MPa (7 to 10 kgf/cm², 99.6 to 142.2 psi)

2. Probable cause
   - Leak in compressor.

3. Solution
   - Replace compressor. (See page 10-S36.)

**NOTE**
- Manifold gauge indications (left side figure) at faulty compressing by compressor.
[2] DISCHARGING, EVACUATING AND CHARGING

IMPORTANT
- When discharging, evacuating or charging the refrigerating system, be sure to observe the "PRECAUTION AT REPAIRING REFRIGERANT CYCLE".

(1) Discharging the System

Discharging R134a Refrigerant
Prepare for the R134a refrigerant recovery and recycling machine.
1. Connect low pressure side hose (blue) from the recovery and recycling machine to LO pressure side charging valve (1) on the compressor (3). Connect high pressure side hose (red) to HI pressure side charging valve (2) on the compressor (3).
2. Follow the manufacturers instructions and discharge the system.

IMPORTANT
- Use only R134a refrigerant recovery and recycling machine. Eliminate mixing R134a equipment, refrigerant, and refrigerant oils with R12 systems to prevent compressor damage.

CAUTION
- Protect fingers with cloth against frostbite by refrigerant when disconnecting the hose to the charging valve.

(1) LO Pressure Side Charging Valve   (3) Compressor
(2) HI Pressure Side Charging Valve

W1030074
(2) Evacuating the System

Evacuating the System

1. Discharge refrigerant from the system by R134a refrigerant recovery and recycling machine. (Refer to "Discharging the system").

2. Connect the charging hose (7) (red) to the HI pressure side charging valve and connect the charging hose (9) (blue) to the LO pressure side charging valve.

3. Connect the center charging hose (8) (green) to a vacuum pump inlet.

4. Open both valves (6), (10) of manifold gauge fully. Then run the vacuum pump (1) to evacuate the refrigerant cycle. (For approx. 15 minutes.)

5. When LO pressure gauge (10) reading is more than 750 mmHg (299 in.Hg), stop the vacuum pump (8) and close both valves (6), (10) of manifold gauge fully.

6. Wait for over 5 minutes with the HI and LO pressure side valves (6), (10) of gauge manifold closed, and then check that gauge indicator does not return to 0.

7. If the gauge indicator is going to approach to 0, check whether there is a leaking point and repair if it is, and then evacuate it again.

W1036001
(3) Charging the System

Charging an Empty System (Liquid)

This procedure is for charging an empty system through the HI pressure side with the refrigerant in the liquid state.

⚠️ CAUTION

- Never run the engine when charging the system through the HI pressure side.
- Do not open the LO pressure valve when refrigerant R134a is being charged in the liquid state (refrigerant container is placed upside-down).

■ IMPORTANT

- After charging the refrigerant in the liquid state with approx. 200 g (1.1 lbs) through the HI pressure side, be sure to recharge the refrigerant in the vapor state to specified amount through the LO pressure side.

1. Close the HI and LO pressure side valves (5), (6) of manifold gauge after the system is evacuated completely.
2. Connect the center charging hose (2) to the can tap valve (7) fitting, and then loosen the center charging hose at the center fitting of manifold gauge until hiss can be heard. Allow the air to escape for few seconds and tighten the nut.
3. Open the HI pressure side valve (5) fully, and keep the container upside-down to charge the refrigerant in the liquid state from the HI pressure side.
4. Charge the refrigerant in the liquid state with approx. 200 g (1.1 lbs) from the HI pressure side.

■ NOTE

- If LO pressure gauge does not show a reading, the system is clogged and must be repaired.

5. Close the HI pressure side valve (5) of manifold gauge and can tap valve of refrigerant container.

G : Connection to Manifold gauge

W1037243
Charging an Empty or Partially Charged System (Vapor)

This procedure is to charge the system through the LO pressure side with refrigerant in the vapor state. When the refrigerant container is placed right side up, refrigerant will enter the system as a vapor.

⚠️ CAUTION
- Never open the HI pressure side valve of manifold gauge while the engine is running.

■ NOTE
- Do not turn the refrigerant container upside-down when charging the system by running the engine.
- Put refrigerant container into a pan of warm water (maximum temperature 40 °C (104 °F)) to keep the vapor pressure in the container slightly higher than vapor pressure in the system.

1. Check that the HI pressure side valve (5) is closed.
2. Start the engine and set an approx. 1500 min⁻¹ (rpm).
3. Turn on the A/C switch.
   Set the temperature control lever to maximum cooling position and the blower switch to HI position.
4. Open the LO pressure side valve (6) of manifold gauge and the can tap valve (1) on refrigerant container and charge the refrigerant until air bubbles in the sight glass of the receiver vanish.
5. After charging the specified amount of refrigerant into the system, close the LO pressure side valve (6) of manifold gauge and can tap valve (1), then stop the engine.
6. Check for gas leak with an electric gas leak tester (See page 10-S15.).

(Reference)
- Specified amount of refrigerant (total) : 630 to 690 g (1.39 to 1.52 lbs) [Refrigerant R134a]
- Manifold gauge indication at fully charged system (at ambient temperature : 30 °C (86 °F))
  
  HI pressure side : 1.27 to 1.66 MPa
  13 to 17 kgf/cm²
  185 to 242 psi

  LO pressure side : 0.15 to 0.20 MPa
  1.5 to 2.0 kgf/cm²
  21 to 28 psi

(4) Compressor (Running)
(5) HI Pressure Side Valve (Close)
(6) LO Pressure Side Valve (Open)
G : Connection to Manifold Gauge

W1038742
(4) Checking Charging Refrigerant Amount

After charging the refrigerant, check for amount of charging refrigerant as follows.

■ NOTE
- The pressure on the following checking are the gauge indications at ambient temperature 30 °C (86 °F), so it should be noted that the pressure will differ some what with the ambient temperature.

1. Disconnect the 1P connector (1) of magnetic clutch.
2. Start the engine and set a approx. 1500 min⁻¹ (rpm).
3. Connect the lead the 1P connector (1) of magnetic clutch. Connect the lead to the battery positive terminal directly, and then set the blower switch to HI position.
4. Leave the system for approx. 5 minutes until the refrigerant cycle becomes stable, keeping pressure on the HI pressure side from 1.27 to 1.66 MPa (13 to 17 kgf/cm², 185 to 242 psi).
5. When the refrigerant cycle is stabilizer, turn off the blower switch and let the compressor alone to run. Then pressure on the LO pressure side gradually drops. At this time, if pressure on the HI pressure side is maintained from 1.27 to 1.66 MPa (13 to 17 kgf/cm², 185 to 242 psi), air bubbles which pass through the sight glass becomes as stated below depending on refrigerant charged amount.

■ Insufficient refrigerant charge
Air bubbles pass continuously the sight glass when pressure on the LO pressure side is over 99.0 kPa (1.01 kgf/cm², 14.4 psi). In this case, charge the refrigerant from the LO pressure side.

■ Properly refrigerant charge
Air bubbles pass through the sight glass continuously when pressure on the LO pressure side is within 59 to 98 kPa (0.6 to 1.0 kgf/cm², 9 to 14 psi).

If the charge refrigerant amount is proper, no air bubble is observed on the sight glass at pressure on the LO pressure side over 99.0 kPa (1.01 kgf/cm², 14.4 psi) when the blower switch is turned on. When the blower switch is turned off, bubbles pass through the sight glass in case pressure on the LO pressure side is within 59 to 98 kPa (0.6 to 1.0 kgf/cm², 9 to 14 psi).

■ Excessive refrigerant charge
Air bubbles pass through the sight glass time to time or no air bubble is observed when pressure on the LO pressure side is under 59 kPa (0.6 kgf/cm², 9 psi).

In this case, discharge excessive refrigerant gradually from the LO pressure side.

(1) 1P Connector (2) Compressor (3) 2P Connector (4) LO Pressure Valve (Close) (5) LO Pressure Gauge (6) HI Pressure Gauge (7) HI Pressure Valve
6. CHECKING, DISASSEMBLING AND SERVICING

[1] CHECKING AND ADJUSTING

(1) Compressor

**Operation of Magnetic Clutch**
1. Start the engine.
2. Check whether abrasion of abnormal noise is heard when only the magnetic clutch pulley is running while the A/C switch is turned OFF.
3. Check that the magnetic clutch (1) does not slip when the A/C switch and blower switch are turned ON (when the air conditioner is in operation).
4. If anything abnormal is found, repair or replace.

(1) Magnetic Clutch  (2) Ground Lead

**Stator Coil**
1. Remove the 2P connector from the magnetic clutch. Measure the resistance of the stator coil with an ohmmeter across the 2P connector on the magnetic clutch.
2. If the measurement is not within the factory specifications, replace the stator coil.

<table>
<thead>
<tr>

</table>

(1) 2P Connector

(2) Air Conditioner Unit

**A/C Blower Relay and Compressor Relay**
1. Remove the pillar cover and the sound absorber of cabin, and disconnect the relay connectors.
2. Perform the following checkings 1) and 2).

(1) A/C Blower Relay  (2) Compressor Relay
1) Connector Voltage

a) A/C Blower Relay
1. The voltage across the 4 terminal and chassis should be approx. battery voltage.
2. When turning the main switch ON and A/C blower switch to LO position, the voltage across the 2 terminal and chassis should be approx. battery voltage.

b) Compressor Relay
1. The voltage across the 4 terminal and chassis should be approx. battery voltage.
2. When turning the main switch ON, A/C blower switch to LO and A/C switch ON, the voltage across the terminal 2 and chassis should be approx. battery voltage.

(1) A/C Blower Relay
(2) Compressor Relay

2) Relay Test
1. Remove the relay (1).
2. Connect the battery (2) and bulb (3) with the relay (1) as shown in the left figure.
3. In this condition, the bulb should light on if the relay is proper.
4. If the bulb light off when disconnecting the jumper lead from the relay 4 terminal, the relay is proper.

(1) Relay
(2) Battery
(3) Bulb

A/C Blower Switch
1. Remove the inner roof and disconnect the A/C blower switch connector (1).
2. Perform the following checkings 1) and 2).

(1) A/C Blower Switch Connector
1) Connector Voltage
1. Turn the main switch ON.
2. Measure the voltage with a voltmeter across the connector 4 terminal and 3 terminal.
3. If the voltage differs from the battery voltage, the wiring harness, A/C relay, fuse or main switch is faulty.

<table>

KiSC issued 03, 2007 A
Pressure Switch

1) **HI Pressure Side**
   1. Connect the manifold gauge (6) to compressor as following procedure.
      Close the HI and LO pressure valves (5), (7) of manifold gauge tightly, and connect the charging hoses (red and blue) (1), (4) to the respective compressor service valves.
   
   **NOTE**
   • Be sure to drive out the air in the charging hoses at the manifold gauge connection end by utilizing the refrigerant pressure in the refrigerant cycle.

   2. Start the engine and set at approx. 1500 min⁻¹ (rpm). Turn on the A/C switch, then set the blower switch to HI position.
   3. Raise pressure on the HI pressure side of the refrigerant cycle by covering the condenser front with a corrugated cardboard, and the pressure switch (8) is activated and the compressor magnetic clutch is turned off. At this time, read the HI pressure gauge of the manifold gauge. If this pressure reading differs largely with the setting pressure, replace the pressure switch with a new one.

### Setting Pressure

[2] DISASSEMBLING AND ASSEMBLING

(1) Separating Cabin from Tractor

Removing Battery
1. Removing the wing nut (4).
2. Remove the battery retainer (2).
3. Disconnect the battery negative cable (1) from the battery (5).
4. Disconnect the battery positive cable (3) from the battery (5).
5. Remove the battery (5).

(When reassembling)
- Connect the battery positive cable first.
- Connect the battery negative cable second.

![Diagram of Battery Removal](image)
Removing Inner Roof
1. Remove the screws (2) from the control panel.
2. Remove the knob (3).
3. Remove the rivets (1) and the screws (4) from the inner roof (5).

(1) Rivet  (4) Screw
(2) Screw  (5) Inner Roof
(3) Knob

Removing Steering Wheel and Meter Panel
1. Remove the steering wheel cap.
2. Remove the steering wheel mounting nut (3).
3. Remove the steering wheel with a steering wheel puller (Code No. 07916-51090).
4. Remove the bolts (2) and the front wiper cover (1).
5. Disconnect the coupler.
6. Remove the meter panel (5).
7. Disconnect the hour-meter cable (8) from the meter panel.
8. Remove the panel lower cover (6).
9. Remove the spring (10) and the steering post stay (9).
10. Remove the bolts (7) from the cabin frame.

(When reassembling)

Disconnecting Water Hoses
1. Loosen the water drain cock (1).
2. Drain the coolant.
3. Remove the hose clamps (3). Disconnect the water hoses (2) from the engine.

(When reassembling)
- Fill the coolant to the specified capacity.

Dismounting Cabin
1. Hook the cabin with the nylon slings not to damage the other roof.
2. Dismount the cabin from the tractor body.
3. Support the cabin with the rigid jacks.

(When reassembling)
- If the beam shield (1) is damaged, replace it with a new one.

(1) Beam Shield (3) Bolt and Nut
(2) Bolt and Nut (4) Bolt
(2) Removing Compressor Assembly

Compressor
1. Discharge the refrigerant from the system. (Refer to "Discharging the Refrigerant" : See page 10-S19.)
2. Disconnect the low pressure pipe (suction) (8) and high pressure pipe (discharge) (7) from the compressor (2), then cap the open fitting immediately to keep moisture out of the system.
3. Disconnect the 1P connector (1), 2P connector (6) and the ground lead (4).
4. Remove the air conditioner belt (3).
5. Remove the bolts (5) and the compressor (2).

(When reassembling)
- After reassembling the compressor, be sure to adjust the air conditioner belt tension and recharge the refrigerant to the system. (Refer to "Charging the Refrigerant" : See page 10-S19.)
- Apply compressor oil (DENSO CO. ND-OIL8 or equivalent) to the O-rings and take care not to damage them.

(When replacing compressor)
- When replacing the compressor with a new one, meet the oil amount with old one.
- Readjust the belt tension. Refer to page G-26.

KiSC issued 03, 2007 A
Hub Plate
1. Three stopper bolts (1) are set in stopper magnet clutch (2) at the position corresponding to the shape of compressor.
2. The stopper magnet clutch (2) is hung on hub plate (3) and it is fixed that the compressor rotates.
3. Remove the magnet clutch mounting screw or nut.
4. Remove the hub plate (3).
   Compressor is used remover magnet clutch (4).
5. Remove the shims.

(When reassembling)
- Do not apply grease or oil on the hub plate facing.
- Do not use the screw or nut again.
- It is confirmed to turn rotor by hand after assembling and not contact with stator.
- Check and adjust the air gap before tight the magnet clutch mounting screw to the specified torque.

Rotor
1. Remove the cir-clip (1).
2. Remove the rotor (3).

(When reassembling)
- Do not use the cir-clip again.
- Assemble the cir-clip for the tapered side to become outside of rotor.
- The width of expanding of cir-clip is set in boss of shaft as a minimum.

(Reference)
- Code No. for circlip : T1065-87450
**Stator**

1. Remove the lead wire from compressor body.
2. Remove the external circlip (1).
3. Remove the stator (2).

*(When reassembling)*

- Do not use the cir-clip again.
- Assemble the cir-clip for the tapered side to become outside of front housing.
- The width of expanding of cir-clip is set is boss of shaft as a minimum.
- Match and assemble the concave part (3) of the front housing (5) and the pin (4) of stator.

*(Reference)*

- Code No. for circlip: T1065-87440

KiSC issued 03, 2007 A
Removing Front Lower Glasses
1. Remove the nuts (4).
2. Remove the front glass plate (1) holding the front lower glass (3).
3. Remove the front lower glass (3) with the front weather strip (2).

Removing Door Glasses
1. Open the door and remove the ball joint (6).
2. Close the door and remove the external cir-clips (7) and the door hinge pins (8).
3. Open the door and hold the door handle (4).
4. Remove the door glass (1).

(When reassembling)
- After installing the bracket to the hinge, hook the bracket on the pin of the cabin frame.
Removing Side Glasses
1. Remove the bolt (3) and the screw (5) holding the side glass (1).
2. Remove the side glass (1).

   (1) Side Glass       (4) Window Lock
   (2) Side Weather Strip  (5) Screw
   (3) Bolt

Removing Rear Glass
1. Remove the ball joints (5).
2. Remove the external cir-clip (6) and the plain washer (7).
3. Hold the rear glass (2).
4. Slide the rear glass (2) to the right side so that the hinges (1) may separate from the cabin frame.
5. Remove the rear glass (2).

Removing Rear Window
1. Remove the bolts (1) and the gasket (2).
2. Hold the rear window (3).
3. Remove the rear window (3).

(1) Bolt  
(2) Gasket  
(3) Rear Window

Replacing Weather Strip (Except Door Glass)

**NOTE**
- Liquid gasket is applied to the glass bottom side.
1. Remove the old weather strip from the glass.
2. Remove the oil liquid gasket from the glass.
3. Clean the glass surface securely.
4. Apply the liquid gasket, Three Bond 1521C or equivalent, to the new weather strip to the bottom side as shown in the figure.
5. Extend and shake the weather strip by hands quickly and carefully.
6. Extend the weather strip by a wooden hammer.

(1) Weather Strip  
P : Liquid Gasket not Applied Area  
S : Liquid Gasket Applied Area  
A : Upper Side  
B : Bottom Side  
L : Approximately 10 cm (4 in.)
Replacing Door Glass Weather Strip

**NOTE**
- Liquid gasket is applied to the lower portion from the middle height of the door glass.
1. Remove the old weather strip from the door glass.
2. Remove the liquid gasket from the door glass.
3. Clean the glass surface securely.
4. Apply the liquid gasket, **Three Bond 1521C** or equivalent, to the new weather strip to the bottom side as shown in the figure.
5. Extend and shake the weather strip by hands quickly and carefully.
6. Extend the weather strip by a wooden hammer.
