Commutator Ring
1. Remove the commutator ring (1).

(1) Commutator Ring

Commutator and Alignment Pins
1. Remove the commutator (1) from the rotor (2).
2. Pull out the five alignment pins (3).

(When reassembling)
- Make sure the five alignment pins (3) are pressed below the surface of the commutator (1).
- Place a few drops of oil into each recess in the commutator (1).

(1) Commutator (3) Alignment Pins
(2) Rotor

Drive Link Spacer and Rotor Set
1. Remove the drive link spacer (1).
2. Remove the rotor (2) and the stator (3) as a unit.

(When reassembling)
- Apply small amount of clean grease to drive link spacer (1) and insert it into the drive slot in the rotor (2).

- IMPORTANT
- Handle the rotor set carefully to avoid nicks and scratches.

(1) Drive Link Spacer (3) Stator
(2) Rotor

Port Cover
1. Inspect the port cover for port fitting sealing surface scratches and thread damage.
2. If these conditions, replace the port cover assembly.

Springs
1. Inspect the springs for bent or distorted coils.
2. If a spring is broken or deformed, all six springs in the unit should be replaced.
Port Manifold
1. Inspect the ground surface of the port manifold.
2. If the port manifold shows nicks or scoring or the edges are not sharp, replace the steering controller assembly.

Valve Plate
1. Inspect the slot edges and ground surface.
2. If the valve plate shows nicks or scoring or the edges are not sharp, replace the steering controller assembly.

Hex. Drive Assembly
1. The pin in the hex. drive assembly should not show wear and must be firmly pressed in place.
2. The sides of the hex. and the slot should not have grooves or scoring.
3. If the hex. drive assembly shows signs of this type of wear, replace the steering controller assembly.

Isolation Manifold
1. Inspect the ground surface of the isolation manifold.
2. If the isolation manifold shows nicks or scoring or the edges are not sharp, replace the steering controller assembly.

Drive Link
1. Inspect each end of the drive link.
2. If the drive link shows wear or scoring, replace the steering controller assembly.
**Commutator Cover**
1. Inspect the ground surfaces of the commutator cover.
2. If the commutator cover has nicks, burrs or scoring, replace the steering controller assembly.

**Commutator Ring and Commutator**
1. Inspect the ground surfaces of the commutator (1) and inside surfaces of the commutator ring (2).
2. If either is worn or damaged, replace the steering controller assembly.

(1) Commutator  (2) Commutator Ring

**Drive Link Spacer**
1. Inspect the drive link spacer.
2. If the drive link spacer is grooved or worn, replace the steering controller assembly.

**Rotor Set**
1. Measure the rotor lob tip to stator lob tip clearance, using the appropriate feller gauge.
2. If the clearance exceeds the allowable limit, replace the steering controller assembly.

<table>
<thead>
<tr>
<th>Clearance between rotor lob tip and stator lob tip</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.08 mm</td>
</tr>
<tr>
<td></td>
<td>0.0031 in.</td>
</tr>
</tbody>
</table>
Drive Plate
1. The rotor side of the drive plate should show the “normal” spiral pattern due to rotor movement.
2. Inspect the thrust bearing side of the plate for brinelling (dents) or spalling (flaking).
3. The flat sides of the input shaft engagement hole should not be grooved or worn.
4. If any of these conditions are present, replace the steering controller assembly.

Bearing and Spacers
1. Inspect the thrust bearing for brinelling (dents) or spalling (flaking).
2. If either exists, or if one or more of the rolls are lost or broken, replace the steering controller assembly.
3. If the seal spacer or bearing spacer are worn or broken, replace the steering controller assembly.

[4] STEERING CYLINDER AND PITMAN ARM
CHECKING

Steering Wheel Free Play
1. Start the engine, and set the engine speed at idling.
2. Rotate the steering wheel lightly by hand, and measure the play.
3. If the play is not within factory specifications, check the steering linkage.

<table>
<thead>
<tr>
<th>Steering wheel free play</th>

DISASSEMBLING AND ASSEMBLING

(1) Removing Steering Cylinder and Pitman Arm

Draining Coolant

**CAUTION**

- Never remove the radiator cap until coolant temperature is well below its boiling point. Then loosen cap slightly to the stop to relieve any excess pressure before removing cap completely.

1. Stop the engine and let cool down.
2. Loosen the drain plug (1) to drain the coolant.
3. Remove the radiator cap to completely drain the coolant.
4. After all coolant is drained, retighten the drain plug (1).

Preparation

1. Remove the front mask and side cover both sides.
2. Remove the front grille (2) and side skirt (1) both sides.
3. Remove the battery (3).
4. Remove the bumper (4).
5. Disconnect the air cleaner rubber hose (8) from the inlet manifold.
6. Remove the bonnet (5), plate (6) and bonnet support (7).

(1) Side Skirt  (5) Bonnet  
(2) Front Grille (6) Plate  
(3) Battery (7) Bonnet Support  
(4) Bumper (8) Air Cleaner Rubber Hose

Radiator

1. Disconnect the three radiator hoses from the radiator (1).
2. Remove the snap pins, and then loosen the radiator mounting screws. (L3710 · L4310)
3. Take out the radiator (1).

(1) Radiator
Removing Steering Cylinder
1. Disconnect the turning delivery hoses (1) and (2).
2. Remove the rod end shaft stopper (3), and then push out the rod end shaft (4).
3. Remove the pitman arm cap (5).
4. Take out the steering cylinder (6).

(When reassembling)
- Apply grease to bushings.
- In assembling the turning delivery hoses (1) and (2) to the steering cylinder (6), connect the delivery hose with the identification mark “A” (tape) to the port (port of ①) in front of the steering cylinder (6).

| Tightening torque                  | Rod end shaft stopper mounting screw | 48.1 to 55.9 N·m |
|                                  |                                   | 4.9 to 5.7 kgf·m  |
|                                  |                                     | 35.5 to 41.2 ft-lbs |

Tie-rods
1. Remove the tie-rods with the tie-rod end lifter.
   In this case, take special care not to damage the tie-rod end nut (slotted nut). (It is preferable to replace it with an unrequired nut.)

(When reassembling)

| Tightening torque   | Tie-rod end nut                  | 2WD       | 49.0 to 68.6 N·m |
|                     |                                   | 5.0 to 7.0 kgf·m |
|                     |                                   | 36.2 to 50.6 ft-lbs |

|                     |                                   | 4WD       | 39.2 to 45.1 N·m |
|                     |                                   |           | 4.0 to 4.6 kgf·m  |
|                     |                                   |           | 28.9 to 33.3 ft-lbs |

**IMPORTANT**
- After tightening the tie-rod end nut to the specified torque, install a cotter pin as shown in the figure left.

Removing Pitman Arm
1. Remove the pitman arm shaft stopper (1).
2. Push out the pitman arm shaft (2), and then take out the pitman arm (3).

(When reassembling)
- Apply grease to bushings and dust seals.

| Tightening torque                  | Pitman arm shaft stopper mounting screw | 48.1 to 55.9 N·m |
|                                  |                                   | 4.9 to 5.7 kgf·m  |
|                                  |                                     | 35.5 to 41.2 ft-lbs |

(1) Pitman Arm Shaft Stopper
(2) Pitman Arm Shaft
(3) Pitman Arm
(4) Washer (Upper)
(5) Washer (Lower)
(2) Disassembling Steering Cylinder

**Rod End**
1. Secure the rod assembly with a vise.
2. Remove the rod end stopper screws.
3. Remove the rod end.

*(When reassembling)*
- Apply liquid lock (Three Bond 1372 or equivalent) to the rod end screw and rod end stopper screws.

**Cylinder Cover Assembly and Rod Assembly**
1. Tap in the cylinder cover assembly (2) lightly to inside of cylinder.
2. Use a pointed tool and remove the internal snap ring (9) by raising it out of the groove of the cylinder tube (3).
3. Tap the rod assembly (1) lightly to remove the cylinder cover assembly (2) from the cylinder tube (3).
4. Pull out the cylinder cover assembly (2) from the rod assembly (1).

*(When reassembling)*
- Apply clean transmission fluid to the O-ring (5) and piston gasket (4).
- Do not spin the rod assembly (1) while inserting.
- Apply grease to the rod gasket (7), dust seal (8) and O-ring (6).

SERVICING

Cylinder Tube, Rod Assembly and Cylinder Covers
1. Inspect the sliding surface of the cylinder tube, rod assembly and cylinder covers.
2. If they shows nicks or scoring, they must be replaced.

Clearance between Rod and Cylinder Cover Bushing
1. Measure the rod O.D. with an outside micrometer.
2. Measure the cylinder cover bushing I.D. with an inside micrometer, and calculate the clearance.
3. If the clearance exceeds the allowable limit, replace the cylinder cover bushing.

<table>

[2] STRUCTURE

The hydraulic system of these tractors is composed of the main components as shown in the figure. This system has the following three functions:

- To raise and lower the implement connected to the three point hitch. For this motion, the position control valve (4) and the linkage installed on the hydraulic cylinder body provide three different applications' position control, draft control, and mixed control.
- Takes out hydraulic power from the front hydraulic block assembly (2) to operate an implement's hydraulic actuator.
- Takes out hydraulic power from the quick couplers (7) included in the auxiliary control valve assembly (6) (if equipped) for the implements with actuators. In this case, the implement's cylinders can be actuated by operating the auxiliary control valves.
[3] HYDRAULIC CIRCUIT FOR THREE POINT HYDRAULIC SYSTEM

Hydraulic Oil Flow
1. When the engine (3) is started, the hydraulic pump (4) is rotated to draw oil from the transmission case (1) through the suction pipe. Supplied oil is filtered by the hydraulic oil filter cartridge (2).
2. Filtered oil is forced out by the hydraulic pump to the front hydraulic block (6). When a front end loader is equipped with the tractor, oil pressure is taken from the front hydraulic block (6), and the return oil from the front end loader flows back to this front hydraulic block (6), to be returned into the oil hydraulic circuit.

3. After that oil into the position control valve (7) through the delivery pipe.
4. The position control valve (7) switches the oil flow, and oil is channeled to the hydraulic cylinder (9) for the three-point hydraulic system or returned to the oil tank (transmission case) (1).
   - The hydraulic system has a relief valve (5) which restricts the maximum pressure in the circuit.
   - When hydraulic power is taken out to use a hydraulically-operated implement, implement's cylinders can be actuated by operating the double-acting auxiliary control valve (11).
[4] HYDRAULIC PUMP

The three point system hydraulic pump pressure-feds the oil drawn from the transmission case through the oil filter to the control valve. The three point system hydraulic pump is driven by the engine fuel camshaft.

This hydraulic pump is pressure loading type gear pump with high volumetric efficiency.

Operation

The hydraulic pump has two meshing gears (2), (3) whose teeth run close to the casing (1). One gear is a drive gear which drives the driven gear. When the drive gear is driven in the direction of the arrow by the fuel camshaft, the gear traps oil between the gear teeth and the casing. The higher the engine speed, the more the pump discharges.

A: Outlet
B: Inlet
(1) Casing
(2) Gear
(3) Gear
The pressure loading system automatically decreases the clearance between the gear and the bushings. A small amount of pressurized oil is fed behind the bushings, pressing them against the gears and forming a tighter seal against leakage. Therefore, leakage from the delivery side (high pressure) to the inlet side (low pressure) does not increase even if the pressure on the delivery side increases.

A: Outlet

2. Gear
3. Pressure Introducing Port
4. Bushings

B: Inlet

[5] OIL FILTER

The oil filter is located at the pump suction line.

This oil filter is cartridge type, and located in the right side of clutch housing case.

The filtration degree of this filter is is $\beta_{60}$ or $\text{BETA}_{60} = 2.5 \text{ (MIN)}$. *

* This is authorized by ISO / 4572 Filter Element Multi-Pass Test.

$\beta_a = (\text{The number of particles which are more than a } \mu\text{m diameter before passing filter.}) / (\text{The number of the same size of particles after passing filter.})$

(1) Hydraulic Oil Filter Cartridge
[6] POSITION CONTROL VALVE

This position control valve is located under the hydraulic cylinder block.

- **Neutral**
  Pressurized oil flows at the P port, pushes open unload poppet (1) and returns to the transmission case from T1 port.
  The oil in the A chamber behind the unload poppet returns to the transmission case through the clearance between spool (2) and control valve. The oil in the hydraulic cylinder does not flow out because the circuit is cut off by the actions of poppet 1 (3) and poppet 2 (6).

  - P: Pump Port
  - C: Cylinder Port
  - T1, T2, T3: Tank Port
  - A: A Chamber
  - (1) Unload Poppet
  - (2) Spool
  - (3) Poppet 1
  - (4) Plate 1
  - (5) Push Rod
  - (6) Poppet 2

- **Lift**
  When the control lever is moved to UP, spool (2) moves to arrow-mark direction.
  The oil entered P port flows into the A chamber, B chamber and closes unload poppet (1), poppet 3 (4).
  The pressure in the circuit slowly rises, pushing open poppet 1 (3), and the hydraulic oil flows into the hydraulic cylinder from the C port, lifting the implement.

  - P: Pump Port
  - C: Cylinder Port
  - T1, T2, T3: Tank Port
  - A: A Chamber
  - B: B Chamber
  - (1) Unload Poppet
  - (2) Spool
  - (3) Poppet 1
  - (4) Poppet 3
- **Down**
  When the control lever is moved to **DOWN**, spool (2) moves to arrow-mark direction, and pushes the push rod (5). The push rod pushes open poppet 2 (6), forming a circuit with the C port and T2 port.
  The oil in the hydraulic cylinder is forced out by the weight of the implement, and returns to the transmission case through the C port and T1 port, lowering the implement. The pressurized oil pushes open unload poppet (1) and returns to the transmission case from T1 port.

  | P: Pump Port | T1, T2, T3, T4: Tank Port |
  | C: Cylinder Port | B: B Chamber |
  | (1) Unload Poppet | (4) Plate 1 |
  | (2) Spool | (5) Push Rod |
  | (3) Poppet 1 | (6) Poppet 2 |

- **Lifting to Neutral**
  In returning from **Lifting to Neutral**, the spool (2) is pushed back to the arrow-mark direction. When the Neutral position comes near, the tapered part (5) of the spool (2) makes the pressure difference at the P port and C port. Therefore, the poppet 1 (3) gradually closes, and absorbs any shock at lifting stop. In that case, since oil is remained in the A chamber of the unload poppet (1), no unload poppet (1) opens. However, the poppet 3 (4) opens because of low pressure in B chamber, and then the oil from the pump returns to the transmission case through T3 port.

  | C: Cylinder Port | B: B Chamber |
  | T1, T2, T3: Tank Port | (4) Poppet 3 |
  | (1) Unload Poppet | (5) Tapered Part |
  | (2) Spool | (3) Poppet 1 |
[7] RELIEF VALVE

The Three point hydraulic system circuit has a relief valve to restrict the maximum pressure in the circuit. The relief valve is incorporated in the front hydraulic block.

The relief valve is of the guide piston type with damping effect.

Among direct acting relief valves, this type is suited to higher pressure and has large capacity. Furthermore, this type is free from unstable operation, such as chattering, which occurs often in direct acting relief valves.

As shown in the figure, the guide is attached to the poppet (6) and a valve chamber D.C. (called the damping chamber) is formed at the bottom of the guide piston. The inlet of the valve leads to the chamber via a clearance between the sliding portion of the guide and the seat (5), minimizing valve vibration with the damping effect of the chamber.

When the oil pressure in the circuit is lower than the setting pressure of the relief valve, the relief valve is not operated and the oil fed to the relief valve from the hydraulic pump flows into the in-port of the hydraulic cylinder.

As the oil pressure in the circuit increases, so does the pressure in the damping chamber D.C. When the pressure rises above the valve setting and overcomes the spring force, the valve opens. Oil then flows out to the transmission case through T port, preventing any further rise in pressure. The valve closes again when enough oil is released to drop pressure below the valve setting.

(Reference)

- Relief Valve setting pressure: 16.2 to 17.2 MPa
  165 to 175 kgf/cm²
  2347 to 2489 psi

- Engine speed: Maximum
- Oil temperature: 40 to 60 °C
  104 to 140 °F

D.C.: Damping Chamber
P: Pump Port
C: Cylinder Port
T: Tank Port

(2) Shim
(3) Plug
(4) Front Hydraulic Block
(5) Seat
(6) Poppet
The main components of the hydraulic cylinder are shown in the figure above.

While the lift arm (11) is rising, oil from the hydraulic pump flows into the hydraulic cylinder through the position control valve (14). Then oil pushes out the piston (7).

While the lift arm (11) is lowering, oil in the hydraulic cylinder is discharged to the transmission case through the position control valve (14) by the weight of the implement. At this time, the lowering speed of the implement can be controlled by the lowering speed adjusting valve (3) attached to the hydraulic cylinder (4). Turning the lowering speed adjusting knob (1) clockwise decreases the lowering speed, and counterclockwise increases lowering speed. When the lowering speed adjusting valve (3) is completely closed, the lift arm (11) is held at its position since oil in the hydraulic cylinder is sealed between the piston (7) and lowering speed adjusting valve (3).
**[9] LINKAGE MECHANISM**

(1) Position Control

Position control is a mechanism to raise or lower the implement attached to the tractor in proportion to the movement of the control lever.

The implement can be positioned at any height by moving the position control lever. Fine position adjustment is also easy.

### Lift

1. When the position control lever is moved to the **LIFT** position, the control arm (2) rotates to the arrow. Therefore, the spool drive lever (1) moves around the fulcrum P and pull the spool (3) opening the **LIFT** circuit.

2. When the lift arm moves upward, the feedback lever shaft (4) is rotated to the arrow, since the feedback rod (5) is actuated. Therefore, the spool drive lever (1) moves around the fulcrum Q and pushes the spool (3).

3. The lift arm stops when the spool returns to the neutral position.
1. When the position control lever is moved to the **DOWN** position, the control arm (2) rotates to the arrow. Therefore, the spool drive lever (1) moves around the fulcrum P and pull the spool (3) opening the **DOWN** circuit.

2. When the lift arm moves downward, the feedback lever shaft (4) is rotated to the arrow, since the feedback rod (5) is actuated. Therefore, the spool drive lever (1) moves around the fulcrum Q and pushes the spool (3).

3. The lift arm stops when the spool (3) returns to the neutral position.

(1) Spool Drive Lever           (4) Feedback Lever Shaft
(2) Control Arm                (5) Feedback Rod
(3) Spool
(2) Position Control with Draft Control

Draft control is a system which maintains a constant traction load, and is suited for the work which needs heavy traction load such as plowing.

The implement is automatically raised when its traction load is increased, and lowers when the traction load is decreased. By maintaining a constant load level, it prevents the tractor from slipping and being loaded excessively. The setting traction load can be adjusted by changing the position of the draft control lever.

Position Control Operation

- Lift (→)
  1. When the position control lever (2) is moved to the LIFT side, the position control link (1) is also rotated and pushes the arm 1 (5).
  2. At the same time, the arm 2 (3) is moved, the connected position control valve becomes the lift circuit, and the lift arm goes up.

- Down (←)
  1. When the position control lever (2) is moved to the DOWN side, the position control link (1) is also rotated.
  2. By this action, the arm 2 (3) and the arm 1 (5) are returned by the return spring (4).
  3. The position control valve becomes the down circuit and the lift arm is lowered.

(Reference)
- For the feedback mechanism of the position control, refer to "(1) Position Control".

The draft control system uses the same control valve as the position control system. Therefore it is possible to use the mixed control. The traction load applied to the tractor is sensed and is fed back to the control valve by means of the other linkage mechanism.
When the draft control lever (9) is operated in the draft control operating range, the draft control lever shaft (6) is rotated, causing the draft cam (5) to move toward the roller (15) installed on the draft control link 2 (14).

(Reference)
- The sensitivity of the draft control can be adjusted by changing the gap between the draft cam (5) and the roller (15) by the draft control lever (9).

Movement of the Link Under Increased Load (→)
1. When the traction load is increased, the torsion bar (18) is twisted according to the load, the draft control rod (16) and the draft cam (5) are pushed to come into contact with the roller (15).
2. Using the A portion as the fulcrum, the draft control link 2 (14) and the draft control link 1 (13) move to push the arm 1 (12).
3. At the same time, the arm 2 (10) is moved, the connected position control valve becomes the lift circuit, and the lift arm (1) goes up.

Movement of the Link Under decreased Load (←)
1. When the lift arm (1) goes up, the traction load is decreased, and the draft control rod (16) is returned.
2. At the same time, the arm 2 (10), arm 1 (12), and draft control link 1 (13) are returned by the return spring (11).
3. The position control valve becomes the down circuit, and the lift arm (1) is lowered.

(Reference)
- The feedback rod (4) of the draft control is provided to maintain the positional relation of the draft cam (5) and the roller (15) to certain state regardless of the height of the lift arm (1).
Mixed control is a system combining position control with draft control. When traction load increases, the draft control functions to raise the lift arms (implement). When traction load decreases, the lift arms (implement) lower to the height set by the position control lever. With the position control only when traction load increases, slippage or engine stop may occur unless the implement is raised. With the draft control only, plowing depth cannot be kept constant if soil hardness changes greatly. The mixed control serves to eliminate such disadvantages.

[10] HYDRAULIC POWER TAKE OFF

If necessary, hydraulic power for implements can be taken out from front hydraulic block or using auxiliary control valves and quick couplers.
- Hydraulic power for the front loader can be taken out from front hydraulic block.
- On L3010, L3410, L3710 and L4310 tractor’s auxiliary control valve assembly is an optional unit. Quick couplers are included in the auxiliary control valve assembly.

(1) Front Hydraulic Block

1. Remove the plugs from OUT port (2) and IN port (1) of the front hydraulic block (4).
2. Install the hydraulic take off adaptors (screw size PT 3/8") to OUT port and IN port.
3. Connect the hydraulic hose to the adaptor (OUT port side) and to the implement control valve IN port.
4. Connect the other hydraulic hose to the adaptor (IN port side) and to the implement control valve TANK (RETURN) port.
5. Turn the slit on the spool (3) end to the arrow side fully as shown in the figure.

**NOTE**
- When implement is not attached, turn the slit on the spool end to the horizontal position fully.

**A:** To Implement Control Valve IN Port
**B:** From Implement Control Valve TANK Port
**C:** When implement is not attached position
**D:** When implement is attached position

(1) IN Port Plug (3) Spool
(2) OUT Port Plug (4) Front Hydraulic Block
A double-acting type auxiliary control valve is used, and the construction is shown in the figure above.

When the spool (1) is at neutral position, the oil flows in from the pump port to push up the check valve (4), and flows out from the out port. The oil coming from the out port flows into the position control valve.

When the auxiliary control valve operating lever is moved to the implement cylinder actuating position, the spool (1) is moved and the oil from the pump port flows into A or B, causing the implement cylinder to operate.

The return oil from the implement cylinder flows out of the tank port through A or B and returns to the transmission case. The oil to the out port is blocked and will not flow to the position control valve.
Quick couplers provided with these tractors are connectable even under pressure with both halves or either half pressurized.

To connect the male half (1) to the body half (2), slide the sleeve (5) to the rear on the body half and insert the male half into the body half. Move the sleeve (5) forward to seat the steel balls (4) for locking the male half (1) into the body half (2).

The male half (1) is locked in place by a ring of steel balls (4) which is held in a groove on the inserted male half by the outer sleeve (5).

1. Coupled condition, both valves closed

3. Pressurized body half to open male half valve.

CHECKING, DISASSEMBLING AND SERVICING

[1] HYDRAULIC PUMP

CHECKING

(1) Pump Test Using Flow-meter

Preparation

1. Remove the side cover RH (1) and front mask (2).
2. Remove the front grille (3) and side skirt RH (4).
3. Remove the delivery pipe (5) between the three point system hydraulic pump (6) and front hydraulic block (7).

(When reassembling)
- Install the copper washers (8) and O-ring (9) firmly.

<table>
<thead>

Hydraulic Flow Test

**IMPORTANT**
- When using a flowmeter other than KUBOTA specified flowmeter, be sure to use the instructions with that flowmeter.
- Do not close the flowmeter loading valve completely, before testing, because it has no relief valve.

1. Install the adaptor 61 with O-ring to the pump discharge port.
2. Connect the hydraulic test hose to the adaptor 61 and flowmeter inlet port.
3. Connect the other hydraulic test hose to the flowmeter outlet port and to transmission fluid filling plug hole.
4. Open the flowmeter loading valve completely. (Turn counterclockwise.)
5. Start the engine and set the engine speed at 2000 to 2200 rpm.
6. Slowly close the loading valve to generate pressure approx. 14.7 MPa (150 kgf/cm², 2133 psi). Hold in this condition until oil temperature reaches approx. 40 °C (104 °F).
7. Open the loading valve completely.
8. Set the engine speed. (Refer to Condition.)
9. Read and note the pump delivery at no pressure.
10. Slowly close the loading valve to increase pressure approx. 17.16 MPa (175 kgf/cm², 2489 psi). As the load is increased, engine speed drops, therefore, reset the engine speed.
11. Read and note the pump delivery at rated pressure.
12. Open the loading valve completely and stop the engine.
13. If the pump delivery does not reach the allowable limit, check the pump suction line, oil filter or hydraulic pump.

DISASSEMBLING AND ASSEMBLING

IMPORTANT

- The hydraulic pump is precision machined and assembled: if disassembled once, it may be unable to maintain its original performance. Therefore, when the hydraulic pump fails, replacement should be carried out with the hydraulic pump assembled except when emergency repair is unavoidable.
- When repair is required, follow the disassembly and servicing procedures shown below with utmost care.
- Be sure to test the hydraulic pump with a flowmeter before disassembling.
- After reassembly, be sure to perform break-in operation and ensure that there is nothing abnormal with the hydraulic pump.

(1) Removing Hydraulic Pump Assembly

Preparation 1

1. Remove the side cover RH (1) and front mask (2).
2. Remove the front grille (3) and side skirt RH (4).

(1) Side Cover RH
(2) Front Mask
(3) Front Grille
(4) Side Skirt RH

Preparation 2

1. Disconnect the GST - independent PTO delivery pipe (5), power steering delivery hose (4) and power steering return hose (3) from the regulator valve (2).
2. Remove the delivery pipe (8).
3. Disconnect the delivery pipe (7) from the three point system hydraulic pump (6).
4. Disconnect the suction rubber hose (1).

(When reassembling)

- Apply grease to the O-rings and take care not to damage them.
- Install the copper washers (9) firmly.

<table>

(2) Disassembling Three Point System Hydraulic Pump

Separating Power Steering Hydraulic Pump
1. Remove the pump cover mounting four screws.
2. Separate the power steering hydraulic pump (2) from the three point system hydraulic pump (4).

(When reassembling)
- Take care not to damage the O-rings.

(1) Pump Cover (2) Power Steering Hydraulic Pump (3) Coupling (4) Three Point System Hydraulic Pump

Disassembling Three Point System Hydraulic Pump
1. Remove the O-ring (5) and seal ring (1).
2. Remove the bushings (2), (4) as a unit.
3. Take out the drive gear (7) and driven gear (3).
4. Take out the bushings (2), (4) in back of pump housing (6) as a unit.

(When reassembling)
- Install the driven gear (3), noting its original direction.
- When installing the bushings (2), (4), be sure to reassemble them to the each original position.
- Take care not to damage the seal rings and O-rings.
- After reassembling the hydraulic pump assembly, mount an arm approx. 100 mm (3.39 in.) long to the drive gear to check for smooth rotation.

[A] Inlet
(1) Seal Ring
(2) Bushing

(4) Bushing

[B] Outlet
(5) O-ring
(6) Pump Housing
(7) Drive Gear
Hydraulic Pump Running-In

After reassembly, perform break-in operation in the following manner, and check the pump for abnormality before use. If the pump temperature should rise noticeably during running-in, recheck should be performed.
1. Install the hydraulic pump to the tractor, and mount the suction pipe and delivery pipe securely.
2. Set the engine speed at 1300 to 1500 rpm, and operate the hydraulic pump at no load for about 10 minutes.
3. Set the engine speed at 2000 to 2200 rpm, and with the hydraulic pump applied with 2.94 MPa (30 kgf/cm², 427 psi) to 4.90 MPa (50 kgf/cm², 711 psi) pressure, operate it for approx. 15 minutes.
4. With the engine set to maximum speed, then actuate the relief valve five times for 25 seconds (one time 5 seconds).

**SERVICING**

![Image](C120F153)

**Housing Bore (Depth of Scratch)**

1. Check for the scratch on the interior surface of the housing caused by the gear.
2. If the scratch reaches more than half the area of the interior surface of the housing, replace at pump assembly.
3. Measure the housing I.D. where the interior surface is not scratched, and measure the housing I.D. where the interior surface is scratched.
4. If the values obtained in the two determinations differ by more than the allowable limit, replace the hydraulic pump as a unit.

<table>
<thead>
<tr>
<th>Depth of scratch</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.09 mm</td>
</tr>
<tr>
<td></td>
<td>0.0035 in.</td>
</tr>
</tbody>
</table>

(Reference)
- Use a cylinder gauge to measure the housing I.D.

**Clearance between Bushing and Gear Shaft**

1. Measure the gear shaft O.D. with an outside micrometer.
2. Measure the bushing I.D. with an inside micrometer, and calculate the clearance.
3. If the clearance exceeds the allowable limit, replace the gear shaft and the bushings as a unit.

<table>
<thead>
<tr>

[2] POSITION CONTROL AND DRAFT CONTROL LINKAGE
CHECKING AND ADJUSTING

Adjusting Position Control Feedback Rod

1. Set the position control lever (1) to the lowest position.
2. Set the draft control lever (2) to the OFF position. (If equipped.)
3. Start the engine, and after warming-up, set the engine speed at the idling.
4. Move the position control lever (1) to the uppermost position. [Contact to the position control lever stopper (3).]
5. Turn the adjusting nut (4) and lock nut (5) together to counterclockwise until the relief valve begins to be operated.
6. From the relief valve operating position of nuts (4) and (5), turn back the adjusting nut (4) and lock nut (5) together to clockwise by 2 turn.
7. Tighten the lock nut (5).
8. Set the engine speed at the maximum.
9. Move the position control lever (1) to the lowest position and uppermost position (3 to 5 times) to check the relief valve does not operate.
10. Set the position control lever (1) to the uppermost position, then move the lift arm to the upper end by hand and measure the free play.
11. Stop the engine.
12. If the measurement is not within the factory specifications, adjusting position control feedback rod again.

<table>
<thead>
<tr>

(4) Adjusting Nut
(5) Lock Nut
Adjusting Draft Control Rod (If Equipped)

1. Set the draft control lever (1) to the OFF position.
2. Adjust the position control feedback rod. (Refer to "Adjusting Position Control Feedback Rod").
3. Start the engine.
4. Move the position control lever and adjust so that the lower link is level.
5. Set the rear side (A) of the draft control lever (1) to the scale 1 of the lever guide. (Refer to the figure left.)
6. Set the engine speed at the maximum.
7. Attach the test bar (3) (see page G-34) to the top link bracket (2).
8. Pull the test bar (3) upward and adjust the draft control rod (6) so that the lower link is raised when the top link bracket (2) and the top link bracket holder (5) come in contact. (Confirm that the lower link is lowered when the test bar (3) is pushed downward.)
9. Confirm that the draft control will not operate (float) when the draft control lever (1) is set to OFF position (B).
10. After adjustment, tighten the lock nut firmly.

DISASSEMBLING AND ASSEMBLING

Rear Wheel

1. Place a jack under the brake case.
2. Loosen and remove the rear wheel mounting screws and nuts.
3. Take out the rear wheel RH.

(When reassembling)

<table>
<thead>
<tr>
<th>Tightening torque</th>

</tbody>
</table>

Fender and Seat Under Cover

1. Disconnect the wire leads for hazard light and tail light.
2. Loosen and remove the fender mounting screws and nut.
3. Take out the fender RH (1).
4. Remove the seat under cover (2).

(1) Fender RH               (2) Seat Under Cover
Removing Position and Draft Control Linkage

1. Disconnect the differential lock rod (1) from differential lock pedal.
2. Disconnect the draft control rod (4) from the top link bracket (5).
3. Remove the position control lever (2) and draft control lever (3).
4. Disconnect the draft control feedback rod (6) from the draft control link 2 (7).
5. Remove the control rod (8) and return spring (9).
6. Remove the position and draft control linkage assembly mounting screws, and then take out the position and draft control linkage assembly (10).
7. Remove the draft control feedback rod stay stopper (11) and draft control feedback rod stay (12).

(When reassembling)
- Assemble so that the punch mark of the feedback rod stay (12) is set to the punch mark of the hydraulic arm shaft (13).
- Securely fit the rod stay stopper (11) into the groove of the hydraulic arm shaft (13).
- After reassembling, be sure to adjust the position control feedback rod and draft control rod (if equipped).
(Refer to CHECKING AND ADJUSTING.)

[A] Hydraulic Cylinder Block Side
[3] RELIEF VALVE

CHECKING AND ADJUSTING

Relief Valve Setting Pressure Test Using Pressure Tester
1. Remove the seat under cover.
2. Remove the plug (screw head size : 17 mm) from front of hydraulic cylinder block.
3. Install the adaptor 58 (screw size : PT 1/4). Then connect the cable and pressure gauge to adaptor 58.
4. Remove the position control lever stopper.
5. Start the engine and set at maximum speed.
6. Move the position control lever all way up to operate the relief valve and read the gauge.
7. If the pressure is not within the factory specifications, remove the plug (1) of front hydraulic block (4) and adjust with the adjusting shims (3).
8. After the relief valve setting pressure test, reset the position control lever stopper firmly.

**Preparation 1**

1. Remove the seat.
2. Loosen and remove the main gear shift (GST shift) lever grip (1).
3. Take out the Hi-Lo shift lever grip (2).
4. Take out the creep speed shift lever grip (3). (If equipped.)
5. Remove the shift lever guide (4).
6. Remove the GST shift cable (5). (GST type only.)
7. Disconnect the jumper leads for hazard light and tail light.

*(When reassembling)*

- Apply liquid gasket (Three Bond 1208D or equivalent) to the joint face between rotary valve cover and GST shift cable (5).
- GST shift lever to neutral position, then align the punched marks (A) of the rotary valve case and rotary valve shaft when install the GST shift cable (5). (GST type only.)

1. Main Gear Shift (GST Shift) Lever Grip
2. Hi-Lo Shift Lever Grip
3. Creep Speed Shift Lever Grip (If Equipped)
4. Shift Lever Guide
5. GST Shift Cable (GST Type Only)
Preparation 2

1. Take out the position control lever grip (2).
2. Take out the draft control lever grip (1). (If equipped.)
3. Take out the auxiliary control lever grips (3). (If equipped.)
4. Disconnect the PTO shift cable (4) from the PTO shift lever (6).
5. Disconnect the PTO limit switch (5) leads.
6. Take out the lowering speed adjusting knob (8), and then remove the seat under cover (7).
7. Remove the mid PTO shift lever (10). (Mid PTO type only.)
8. Loosen and remove the front wheel drive shift lever grip (9). (4WD type only.)
9. Disconnect the jumper leads for hazard light and tail light.
10. Remove the quick coupler assembly (11). (If equipped.)

(When reassembling)
- Check and adjust the PTO shift cable. (See page 10-528.)

Fender and Floor Seat

1. Loosen and remove the fenders and floor seat mounting screws to the platform (3).
2. Loosen and remove the floor seat mounting two bolts and nuts.
3. Support the floor seat with nylon lift strap and hoist.
4. Remove the fenders (1) and floor seat (2) as a unit.

(When reassembling)

(1) Fenders
(2) Floor Seat
(3) Platform
Auxiliary Control Valves (If Equipped)
1. Disconnect the draft control feedback rod. (If equipped.)
2. Loosen and remove the hydraulic pipe mounting three screws.
3. Loosen and remove the auxiliary control valves mounting two screws from floor seat support RH.
4. Take out the auxiliary control valves (2), hydraulic pipe (1) and quick couplers as a unit.

(When reassembling)
- Take care not to damage the O-rings.

Hydraulic Cylinder Assembly
1. Disconnect the draft control rod from the top link bracket. (If equipped.)
2. Disconnect the lift rods from lift arms.
3. Remove the delivery pipe (from front hydraulic block to hydraulic cylinder assembly).
4. Loosen and remove the hydraulic cylinder assembly mounting screws and nuts.
5. Support the hydraulic cylinder assembly with nylon lift strap and hoist, and then take out it.

(When reassembling)
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the hydraulic cylinder assembly and transmission case after eliminating the water, oil and stuck liquid gasket.
- When replacing the hydraulic cylinder assembly mounting stud bolts, apply liquid lock (Three Bond 1372 or equivalent) to “A” portion of the stud bolt.

**NOTE**
- Reassemble the hydraulic cylinder assembly to the tractor, be sure to adjust the position control feedback rod and draft control rod (if equipped). (See page 8-59, 510.)
(2) Disassembling Hydraulic Cylinder Assembly

Hydraulic Rod and Hydraulic Piston
1. Tap out the spring pin.
2. Remove the hydraulic rod.
3. Remove the plug (screw head size: 17 mm) from front of hydraulic cylinder.
4. Inject the compressed air through the plug hole, and take out the hydraulic piston.

⚠️ CAUTION
- Do not put your hand into the hydraulic cylinder block because the hydraulic piston jumps out with a strong force, which is dangerous.

(When reassembling)
- Install the piston, noting O-ring (2) and back-up ring (3). (See figure.)
- Apply transmission fluid to the cylinder, and then install the piston.
- Apply grease to the piston bottom contacts with hydraulic rod.

1. Piston
2. O-ring
3. Back-up Ring

Lift Arm, Hydraulic Arm and Hydraulic Arm Shaft
1. Disconnect the feedback rod from feedback lever.
2. Remove the lift arm setting screws.
3. Remove the lift arm LH (4).
4. Draw out the hydraulic arm shaft (5) and lift arm RH (6) as a unit.
5. Take out the hydraulic arm (1).
6. Remove the collar (3) and O-ring (2).

(When reassembling)
- Align the alignment marks (7) of the hydraulic arm (1) and hydraulic arm shaft (5).
- Align the alignment marks (8) of the lift arms (6), (4) and hydraulic arm shaft (5).
- Apply grease to the right and left bushings of hydraulic cylinder block and O-rings (2).
- Take care not to damage the O-rings (2).

**Bushings**

1. Remove the bushings (3) and (4).

**When reassembling**
- When press-fitting new bushings (3), (4) with a press-fitting tool (see page G-34) observe the dimensions described in the figure.
- Apply transmission fluid to the hydraulic cylinder boss and bushing.
- Press-fit the bushing so that each seam face upward.

<table>

(1) Position Control Valve
Disassembling Position Control Valve

- It is possible to disassemble as shown in the figure above.

**IMPORTANT**
- Set screw (4) and spool joint 1 (2) are adjusted to very close accuracy. Do not disassemble them or cause them to be out of order unless necessary.
  If disassembled due to unavoidable reasons, be sure to make the following adjustments before assembling.

**Dimensions for assembling spool joint 1 (2)**
1. Turn and adjust the spool joint 1 (2) so that the dimension (A) between the spool joint 2 (1) and the plate 1 (5) is 47.5 mm (1.87 in.).
2. After the adjustment, be sure to adjust the position control feedback rod.

**Dimensions for assembling set screw (4)**
1. Set the dimension (B) between the plate 1 (5) and the valve body to 16.0 mm (0.63 in.).
2. Turn and adjust the set screw (4) so that the clearance (C) between the set screw (4) and the push rod (6) is 0.1 to 0.2 mm (0.0039 to 0.0079 in.).
**Lowering Speed Adjusting Valve**

1. Remove the lowering speed adjusting valve assembly from hydraulic cylinder block.
2. Remove the internal snap ring (4), and remove the hydraulic adjusting shaft (6).
3. Remove the internal snap ring (11), and draw out the spring (9) and adjusting collar (8).

*(When reassembling)*

- Install the hydraulic adjusting shaft (6) to valve body (7), noting O-rings (12).

<table>
<thead>
<tr>

<tr>
<td>(6) Hydraulic Adjusting Shaft</td>
<td>(12) O-rings</td>
</tr>
</tbody>
</table>

**Hydraulic Cylinder Bore**

1. Check the cylinder internal surface for scoring or damage.
2. Measure the cylinder I.D. with a cylinder gauge.
3. If the measurement exceeds the allowable limit, replace the hydraulic cylinder block.

<table>
<thead>
<tr>
<th>Cylinder I.D.</th>

<tr>
<td></td>
<td>3.54330 to 3.54527 in.</td>
<td>3.54921 in.</td>
</tr>
</tbody>
</table>

**Clearance between Hydraulic Arm Shaft and Bushing**

1. Measure the hydraulic arm shaft O.D. with an outside micrometer.
2. Measure the bushing I.D. with an inside micrometer, and calculate the clearance.
3. If the clearance exceeds the allowable limit, replace the bushing.

<table>

(4) Starter Relay  (8) Glow Relay  (For Preheating System)  (15) Meter Panel  (19) Hazard indicator  (23) Air Cleaner Clogged Lamp
When the main switch (3) is turned to the **ON** position, the terminal B is connected to the terminal AC and magnetizes the coil of glow relay (7).

The glow relay (7) is turned **ON**, the glow plugs (8) become red hot, and at the same time, light up the glow lamp on the meter panel.

When the main switch (3) is turned to the **START** position with the shuttle limit switch (4) (Mechanical transmission and GST Mode), HST switch (HST Model) and PTO limit switch (5) **ON**, after the glow lamp is put out light.

The terminal B is connected to the terminal AC, ST and G so that the starter motor (6) begins running and the glow plugs (8) are kept red hot.

The main switch (3) automatically returns to the **ON** position when it is released after the engine starts.

At the **ON** position, the starting circuit to be opened, stopping the starter motor (6).
(1) Starter Motor

The starter motor is a reduction type. The speed of the pinion gear is reduced to approx. one third of motor one.

(1)-1 Roller Clutch

The roller clutch prevents the armature from being driven by the rotational force of the engine when the pinion and the engine flywheel ring gear are in mesh.

(a) When power is transmitted, the rotational force of the outer clutch gear (1) drives the pinion gear (6) through the roller (2).

(b) Even when the pinion gear is driven by the engine flywheel ring gear and its speed exceeds that of the outer clutch gear, the rotation force of the ring gear is not transmitted to the outer clutch gear.

Diagram:

- (1) Outer Clutch Gear
- (2) Roller
- (3) Roller Spring
- (4) Inner Spline Tube
- (5) Pinion Shaft, Solid with Pinion Gear
- (6) Pinion Gear
- (7) Locked Position
(1)-2 Magnet Switch

The magnet switch series as a relay to drive the armature. It consists of a pull-in coil, a holding coil and a plunger. It works as follows:

1. When the main switch is at the START position, the armature is rotated at a small amperage as the pull-in coil (7) and the holding coil (6) attract the plunger (4) to the left.

2. When the main circuit from the contact plate (8) to armature is closed by the plunger (4), the armature starts rotating at a strong torque. At the same time, a current stops flowing into the pull-in coil and the plunger is kept attracted by the holding coil alone.

3. When the main switch is released from the START position after starting the engine, it returns to the ON position so that the flow of a current to the holding coil also stops. Thus, the armature stops rotating.

(1)-3 Operation of Starter Motor

- When the Main Switch is Turned to "START" Position
  With the main switch (1) is at the START position, current flows from the battery (2) to the holding coil (3) and pull-in coil (4). This moves the plunger (5) electromagnetically and pushes out the pinion gear (6). At the same time, current flowing through the pull-in coil (4) rotates the armature (7) at low speeds.

- When the Pinion Gear Meshes with the Ring Gear
  When the pinion gear (6) comes into mesh with the ring gear (8) on the flywheel, a large current flows from the battery directly into the field coil (9) and armature coil (10), but not through the pull-in coil (4). This rotates the armature (7) at a high speed, which in turn drives the ring gear through the pinion gear at 200 to 300 rpm.
When the Engine is Running

When the engine runs so fast that the ring gear (8) starts to turn the pinion gear (6), the roller clutch (11), (12) are actuated to prevent excessive high-speed revolutions of the armature (7).

- 6: Pinion Gear
- 7: Armature
- 8: Ring Gear
- 11: Clutch Gear
- 12: Roller

When the Main Switch is Released

When the main switch (1) released, the main switch returns from the START to the ON position and opens the starter circuit. Then, current flows from the battery (2) to the pull-in coil (4) and holding coil (3) through the contact plate (13). Since the magnetic forces of the pull-in coil and holding coil become partially opposed and cancel one another, the plunger (5) is restored by the tension of the return spring (14).

This opens the contacts on the contact plate and separates the pinion gear (6) from the ring gear (8), so that the pinion gear stops rotating.

- 1: Main Switch
- 2: Battery
- 3: Holding Coil
- 4: Pull-in Coil
- 5: Plunger
- 6: Pinion Gear
- 8: Ring Gear
- 13: Contact Plate
- 14: Return Spring

(2) Glow Control System

This preheater employs an ON glow system which supplies current to the glow plug (6) for a necessary length of time by simply turning on the main switch (4).

The structure of this system is as shown in the figure. The energizing time of this glow plug (6) is controlled by the temperature of cooling water of the engine. When the glow lamp (2) is turned off, the operator knows that the preheating is completed.

The glow plug (6) is provided with a super glow plug which is capable of heating quickly in a short time.

- 1: Glow Controller
- 2: Glow Lamp
- 3: Glow Relay
- 4: Main Switch
- 5: Battery
- 6: Glow Plug
- 7: Water Temperature Sensor

(a) OFF
(b) ON
(c) START
**Super Glow Plug**

This plug is a two-material type QGS (Quick Glow System) for quick temperature rise, and has self-controlling function as well as excellent durability.

The heater (4) connected in series to the heater (3), which also functions as the resistor, is incorporated in the sheath tube (1) of the super glow plug.

The resistance of this heater (3) cum resistor is small when the temperature is low, while the resistance becomes large when the temperature rises.

Therefore, because sufficient current is flown to the heater (4) during the initial period of energization, the temperature rises quickly and the resistance grows with the rise in the temperature of the resistor, the flowing current is reduced to prevent the heater (4) from being heated.

The ignition point is in the area of 2 to 3 mm (0.079 to 0.118 in.) from the tip of the plug in order to reduce its projection into the combustion chamber.

**Glow Controller**

The glow controller detects the cooling water temperature by means of the water temperature sensor, and controls the time to supply current to the glow plug and the glow lamp according to the detected water temperature. The relation between the water temperature and the time of current supply is as shown in the figure.

(A) Characteristic of Glow Controller Timer

<table>

</tbody>
</table>
■ Glow Relay

The glow relay is actuated by the signal from the glow controller and supplies the battery power to the glow plug directly.

(1) Contact Point  (2) Coil

■ Water Temperature Sensor

A water temperature sensor for glowing is provided on the thermostat unit of the engine.

The water temperature sensor incorporates the thermistor (1). When the water temperature is high, the resistance of the thermistor is small, and when the water temperature is low, the resistance becomes large.

■ Glow Lamp

The glow lamp (1) is provided inside the meter panel. When the preheating is completed (engine can be started), the glow lamp goes out.

(1) Glow Lamp
Function
1. When the main switch (4) is turned ON, the glow relay (3) is turned on by the glow controller (1), allowing the current to flow to the glow plug (6). The current flows simultaneously to the glow lamp (2) to turn it on.
2. The glow relay (3) is turned off after it is preheated for an appropriate length of time according to the cooling water temperature detected by the water temperature sensor (7). The glow lamp (2) is turned off at the same time to inform the operator of the completion of preheating.
3. When the main switch (4) is set to START position, the current flows from the main switch (4) to the glow plug (6) to make the starting easy. When the main switch (4) is set to START position during preheating, the glow relay (3) is turned off to turn off the glow lamp (2).
On the engine key switch shut-off system, turning the main switch from the ON position to the OFF position moves the fuel injection pump control rack to the "No Fuel Injection" position through the fuel cut off solenoid and the same linkage as when the stop lever is operated by manual operation.

As soon as the main switch (1) is turned from the ON position to the OFF position, the capacitor starts discharging and continues it for approx. 10 seconds.

During the discharging period, the current flows as follows:
- Battery (3) → Main Switch (1) → Timer Relay (4) → Fuel Cut Off Solenoid (7) → Ground.

Then, the engine stops.

After 10 seconds, the relay contact point in the timer open to prevent the battery from overdischarging.
(1) Operation of Timer Relay

When the Main Switch is Turned to “ON” Position
The capacitor C1 is charged by the battery current flowing through the terminal 3 immediately after the main switch (3) is turned to the ON position.
1. The transistor Tr2 is then turned on.
2. The transistor Tr1 remains off because the battery voltage is applied to the anode of the zener diode ZD2.
3. Therefore, the relay coil (7) does not conduct, and the relay contact points (8) remain open so that the battery current does not flow into the fuel cut off solenoid (4).

(Reference)
- The critical voltage of zener diode ZD2 is about 5 volts.

(1) Battery (5) Injection Pump
(2) Slow Blow Fuse (6) Fuses
(3) Main Switch (7) Relay Coil
(4) Fuel Cut Off Solenoid (8) Contact Point

When the Main Switch is Turned to “OFF” Position
Changes described below take place in the timer to stop the engine when the main switch (3) is turned to the OFF position.
1. The battery voltage is not applied to the terminal 3.
2. Since the discharge current from capacitor C1 flows into the base of transistor Tr2, it is held ON state.
3. The voltage at the anode of the zener diode ZD2 becomes low, and the voltage across the zener diode ZD2 exceeds the critical voltage so that this zener diode conducts.
4. Consequently, the battery current supplied from the terminal 4 begins to flow from the collector to the emitter of the relay drive transistor Tr1.
5. The transistor Tr1 is then turned on, and the battery current flows into the relay coil (7) to close relay contact point (8).
6. The battery current flows into the fuel cut off solenoid (4) via the terminals 4 and 1.
7. As a result, the amount of the fuel injected from the injection pump (5) becomes zero to stop the engine.
8. The transistor Tr2 turns off after the discharging period approx. 10 seconds of the capacitor C1.
No current flows through the circuit, and then the relay contact point (8) opens so that the battery current does not flow into the fuel cut off solenoid (4).

(1) Battery (5) Injection Pump
(2) Slow Blow Fuse (6) Fuses
(3) Main Switch (7) Relay Coil
(4) Fuel Cut Off Solenoid (8) Contact Point
(2) Fuel Cut Off Solenoid

Flowing of the battery current into the coil (2) while the timer relay contact point is closed attracts the plunger (1) to actuate the stop lever of the injection pump. When the battery current stops, the plunger is returned to the original position by the spring.

(1) Plunger (2) Coil

[5] CHARGING SYSTEM

The charging system supplies electric power for various electrical devices and also charges the battery while the engine runs. This alternator has IC regulator.
(1) Alternator

A compact alternator with an IC regulator is used, having the following characteristics:
- Approximately 26% lighter and 17% smaller than a standard alternator.
- Cooling performance and safety have been improved by combining the cooling fan with the rotor and incorporating the fan/rotor unit inside the alternator.
- IC regulator is fitted inside the alternator.
- The rectifier, IC regulator and similar components are easy to remove, making it easier to service the alternator.

(2) IC Regulator

An IC regulator uses solid state transistors, chips or other semiconductor elements instead of the relays in a conventional regulator. Stable characteristics are achieved by cutting off the field current.

IC regulators have the following characteristics:
- The control voltage does not change over time, so the need for readjustment is eliminated. Since there are no moving parts, IC regulators are extremely durable and resistant to vibration.
- The overheat compensation characteristics ensure that the control voltage is reduced as the temperature rises, so the battery is charged at just the right level.

The internal circuitry of the IC regulator is shown in the diagram. It consists of a hybrid IC incorporating a monolithic IC. (The internal circuitry of the monolithic IC is extremely complex, so it is shown as simply "MI.C circuit".

Tr1 acts as the contacts controlling the field current, and Tr2 acts as the charge lamp relay controlling the flashing of the charge lamp.

The MI.C circuit controls Tr1 and Tr2, and monitors the alternator output voltage, and detects any drop in terminal voltage or breaks in the rotor coil.
(3) Operation of Charging System

When Main Switch is Turned to "ON" Position

As the battery voltage is added to the terminal IG, M.I.C circuit detects it and makes current pour to the Tr1. It results to pour the initial exciting current to the rotor coil. (In this case, M.I.C circuit makes current pour on and off the Tr1 in pulse and limits the battery discharging current to small value (Approx. 0.17 A) when the main switch is turned on.)

As the alternator is not rotated, it doesn’t generate. Therefore the voltage of terminal P is zero volt. M.I.C circuit detects it and makes current pour to the Tr2. It results light on the charge lamp.

M.I.C : Monolithic IC  Tr2 : Transistor
Tr1 : Transistor
(1) Main Switch (5) IC Regulator
(2) Slow Blow Fuse (6) Alternator
(3) Fuse (7) Rotor Coil
(4) Charge Lamp

When Engine Starts

When the engine starts and the alternator rotates, M.I.C circuit makes current pour continuously to the Tr1 instead of the uncontinuous (in pulse) current. Therefore a sufficient exciting current flows and a generated voltage rises rapidly. As a result, the current to the Tr2 is shut and lights off the charge lamp.

When terminal B voltage rises over the battery voltage, a charged current flows to the battery.

[6] LIGHTING SYSTEM

(1) Head Light

The lighting system consists of combination switch (light switch and hazard switch), head lights, tail lights, panel board illuminations, hazard unit, hazard lights, hazard indicator lamps, working lights, etc.

The light switch, which forms a combination switch with the hazard switch, has three position; OFF, LOW-BEAM and HIGH-BEAM.
(2) Hazard Light and Turn Signal Light

(2) -1 Hazard Light

When the hazard switch is turned to ON, both hazard lights are winked. In detail, refer to page 10-M7.

(2) -2 Turn Signal Light

Above figure shows the current in case of right turn signal switch being turned to “R” position. In detail, refer to page 10-M8.

(2) -3 Hazard Light with Turn Signal Light

Above figure shows the current in case of right turn signal switch being turned “R” position and hazard switch ON. Right turn signal is winked but left turn signal is kept to light ON. In detail, refer to page 10-M9.
Hazard Unit

The hazard unit, consisting of a capacitor, transistors, diodes, resistors and the other parts, sends intermittent current to the hazard lights. Intermittent current is generated in the following sequence.

1. When the hazard switch is turned OFF, voltage from the battery is applied to capacitors C2 and C3, causing the capacitor always to be overcharged and the circuit to be opened.
2. When the hazard switch is turned ON, the capacitor C2 starts discharging. When the discharged voltage of the capacitor C2 is lower than the voltage of battery and the potential difference becomes large, the base current of the transistor T2 increases and turn on the transistor T2.
3. Battery current flowing through the transistor T2 goes through the resistor R5 and charges the capacitor C1.
4. When the capacitor C1 is fully charged, the current from the resistor R5 becomes the base current of the transistor T3 and turn on the transistor T3.
5. When the transistor T3 is turned on, battery current magnetizes the coil R. As the contact S is drawn to be connected with the terminal C, the battery current flows through the hazard switch and turns on the hazard lights.
6. When the hazard light is lighted, all the battery current flow through the contact S and will not flow through the coil R. But, the current discharged from the capacitor C1 becomes the base current to maintain the transistor T3 in ON mode. Current discharged from the capacitor C3 flows through the coil R and keeps the hazard lights turned on.
7. When the capacitor C1 completes discharging, no base current is present in the transistor T3, turning off the transistor T3. Then the current from the capacitor C3 to the coil R is shut off, causing the contact S to move away from the terminal C, and the hazard lights are turned off.
8. The capacitor C1 controls the time from turning on to turning off the light, while the capacitor C2 and resistor R2 control the lighting time.
[7] EASY CHECKER

(1) Indication Items

- **Glow Lamp**
  - LF-34
  - When the main switch ON, the lamp is ON and the combustion chamber is heated. After heating, the lamp turns OFF.

- **Battery Charge Lamp**
  - LF-35
  - Light up when battery charging is improper.

- **Engine Oil Pressure Lamp**
  - LF-36
  - Light up when the engine oil pressure drops below approx. 49 kPa (0.5 kgf/cm², 7.1 psi)

- **Air Cleaner Clogged Lamp**
  - LF-37
  - Light up when the air cleaner is clogged.

- **Parking Brake Lamp**
  - LF-38
  - Light up when the parking brake operation.

(2) Engine Oil Pressure Alarm

When the engine oil pressure has dropped, the engine oil pressure switch (1) is activated to let the current flow from the main switch and to light up the lamp (2).

(1) Engine Oil Pressure Switch  (2) Engine Oil Pressure Lamp

- **Engine Oil Pressure Switch**
  - While oil pressure is high and the force applied to the diaphragm (2) is larger than the spring tension, the terminal contact (1) is open separated from the body contact (3). If the pressure drops below approx. 49 kPa (0.5 kgf/cm², 7.1 psi), the contact closes.

(1) Terminal Contact  (3) Body Contact
(2) Diaphragm
(3) Air Cleaner Clogged Lamp

When the air cleaner is clogged and the negative pressure of the suction air increases, the air cleaner sensor (1) is turned ON, causing the current to flow from the main switch and the lamp (2) is lighted.

(1) Air Cleaner Sensor          (2) Air Cleaner Clogged Lamp

Air Cleaner Sensor

The micro switch (3) is normally opened. When the air cleaner is clogged, the negative pressure is created in the outlet port of air cleaner and the diaphragm (2) is attracted. And the micro switch is turned on when the negative pressure exceeds approx. 6.22 kPa (635 mmAq.).

(1) Filter                  (4) Terminals
(2) Diaphragm             (5) Spring
(3) Micro Switch          (6) Guide
[8] GAUGES

The fuel quantity and coolant temperature are indicated by the ammeters. The ammeters indicate each amperate flowing through the fuel level sensor (5) for the fuel quantity detection and through the coolant temperature sensor (6) for the coolant temperature detection.

(1) Voltage Regulator  (4) Coolant Temperature Gauge
(2) Meter Panel         (5) Fuel Level Sensor
(3) Fuel Gauge          (6) Coolant Temperature Sensor

---

Fuel Level Sensor

The remaining fuel quantity is detected by the fuel level sensor installed in the fuel tank and indicated on the fuel gauge. For detection, a float and a resistor are used.

As the float (1) lowers, the resistance of the variable resistor (2) varies. The relation between the amount of fuel and the resistance is as follows.

<table>
<thead>
<tr>
<th></th>
<th>F</th>
<th>1/2</th>
<th>E</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 to 5 Ω</td>
<td>28 to 36 Ω</td>
<td>103 to 117 Ω</td>
<td></td>
</tr>
</tbody>
</table>

(1) Float          (2) Variable Resistor
Coolant Temperature Sensor

The coolant temperature sensor is installed to the cylinder head of engine, and its tip is in touch with the coolant. It contains a thermistor (4) whose electrical resistance decreases as the temperature increases.

Current varies with changes in the coolant temperature, and the increases or decreases in the current move the pointer of gauge.

<table>
<thead>
<tr>
<th>Characteristics of Thermistor</th>

</tr>
<tr>
<td>170 °C (338 °F)</td>
</tr>
</tbody>
</table>

Both the fuel gauge and coolant temperature gauge use bimetal types.

When the main switch (2) is turned ON, the current controlled by the resistance of the sensor (7) flows through the circuit and is grounded.

This current heats the heat wire (5), causing the bimetal (4) to deflect in proportion to the current, thereby swinging the indicating needle (6) connected to the bimetal (4).

When the main switch (2) is turned OFF, the indicating needle (6) returns to its original position.

The voltage regulator (3) is installed so as to prevent errors due to voltage fluctuation.

CHECKING, DISASSEMBLING AND SERVICING

⚠️ CAUTION
- To avoid accidental short circuit, be sure to attach the positive cable to the positive terminal before the ground cable is attached to the negative terminal.

⚠️ IMPORTANT
- If the tractor is to be operated for a short time without battery (using a slave battery for starting), do not, under any circumstances, interrupt the circuit by switching off the key switch before stopping the engine by pulling engine stop knob. Use additional current (lights) while engine is running. Insulate terminal of battery. If this advice is disregarded, damage to alternator and regulator may result.

⚠️ NOTE
- In this section, when measuring resistance, voltage and amperage, leads of ohmmeter, voltmeter and ammeter are represented by — marks in figure.

[1] BATTERY

CHECKING

Battery Voltage
1. Stop the engine and turn the main switch off.
2. Connect the COM (−) lead of the voltmeter to the battery’s negative terminal post and the (+) lead to the positive terminal post, and measure the battery voltage.
3. If the battery voltage is less than the factory specifications, check the battery condition. (See the next page.)

<table>
<thead>
<tr>
<th>Battery voltage</th>
<th>Factory spec.</th>
<th>More than 12 V</th>
</tr>
</thead>
</table>

Battery Terminal Connection
1. Turn the main switch on, and turn on the head light.
2. Measure the voltage with a voltmeter across the battery’s positive terminal post and the cable terminal, and the voltage across the battery’s negative terminal post and the chassis.
3. If the measurement exceeds the factory specifications, clean the battery terminal posts and cable clamps, and tighten them firmly.

<table>
<thead>
<tr>
<th>Factory spec.</th>
<th>Less than 0.1 V</th>
</tr>
</thead>
</table>
Battery Specific Gravity

**CAUTION**
- Keep electrolyte away from eyes, hands and clothes. If you are spattered with it, wash it away completely with water.

1. Check the specific gravity of the electrolyte in each cell with a hydrometer.
2. When the electrolyte temperature differs from that at which the hydrometer was calibrated, correct the specific gravity reading following the formula mentioned in (Reference) below.
3. If the specific gravity is less than 1.215 (after it is corrected for temperature), charge or replace the battery.
4. If the specific gravity differs between any two cells by more than 0.05, replace the battery.

**NOTE**
- Hold the hydrometer tube vertical without removing it from the electrolyte.
- Do not suck too much electrolyte into the tube.
- Allow the float to move freely and hold the hydrometer at eye level.
- The hydrometer reading must be taken at the highest electrolyte level.

(Reference)
- Specific gravity slightly varies with temperature. To be exact, the specific gravity decreases by 0.0007 with an increase of 1 °C (0.0004 with an increase of 1 °F) in temperature, and increases by 0.0007 with a decrease of 1 °C (0.0004 with a decrease of 1 °F).

Therefore, using 20 °C (68 °F) as a reference, the specific gravity reading must be corrected by the following formula:
- Specific gravity at 20 °C = Measured value + 0.0007 × (electrolyte temperature – 20 °C)
- Specific gravity at 68 °F = Measured value + 0.0004 × (electrolyte temperature – 68 °F)

Recharging

⚠️ CAUTION

- When the battery is being activated, hydrogen and oxygen gases in the battery are extremely explosive. Keep open sparks and flames away from the battery at all times, especially when charging the battery.
- When charging battery, remove battery vent plugs.
- When disconnecting the cable from the battery, start with the negative terminal first. When connecting the cable to the battery, start with the positive terminal first.
- Never check battery charge by placing a metal object across the posts. Use a voltmeter or hydrometer.

1) Slow Charging

1. Add distilled water if the electrolyte level is low. When charging, the amount of electrolyte should be slightly lower than the specified level to prevent overflow.
2. Connect the battery to the charging unit, following the manufacturer’s instructions.
3. As the electrolyte generates gas while charging, remove all port caps.
4. The electrolyte temperature must not exceed 40 °C (105 °F) during charging. If it exceed 40 °C (105 °F), decrease the charging amperage or stop charging for a while.
5. When charging several batteries in series, charge at the rate of the smallest battery in the line.

2) Quick Charging

1. Determine the proper charging current and charging time with the tester attached to the quick charger.
2. Determine the proper charging current as 1/1 of the battery capacity. If the battery capacity exceeds 50 Ah, consider 50 A as the maximum.

■ Precaution for Operating a Quick Charger

- Operation with a quick charger differs according to the type. Consult the instruction manual and use accordingly.

Directions for Storage

1. When shutting down the tractor for long periods of time, remove the battery from the tractor, adjust the electrolyte to the proper level, and after fully charging, store the battery in a well ventilated placed where it is not exposed to direct sunlight.
2. Since the battery self-discharges by approx. 0.5 % per day even in storage, it must be once every two months in cold season.
3. When storing the battery mounted on the tractor, disconnect the ground cable from the battery’s negative terminal post.

[2] STARTING SYSTEM

CHECKING

Main Switch
1. Remove the meter panel, and disconnect the main switch connectors after turning the main switch off.
2. Perform the following checking.

(1) Main Switch

Connector Voltage
1. Measure the voltage with a voltmeter across the connector B terminal and chassis.
2. If the voltage differs from the battery voltage (11 to 14 V), the wiring harness is faulty.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Connector B terminal – Chassis</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a) From Battery Positive Terminal</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(1) Main Switch

Main Switch Key at OFF Position
1. Turn the main switch off.
2. Measure the resistances with an ohmmeter across the B terminal and the AC terminal, B terminal and ST terminal, and B terminal and G terminal.
3. If infinity is not indicated, the contacts of the main switch are faulty.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>B terminal – AC terminal</th>
<th>Infinity</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>B terminal – ST terminal</td>
<td>Infinity</td>
</tr>
<tr>
<td></td>
<td>B terminal – G terminal</td>
<td>Infinity</td>
</tr>
</tbody>
</table>

Main Switch Key at ON Position
1. Turn the main switch on.
2. Measure the resistances with an ohmmeter across the B terminal and the AC terminal.
3. If 0 ohm is not indicated, the B – AC contacts of the main switch are faulty.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>B terminal – AC terminal</th>
<th>0 ohm</th>
</tr>
</thead>
</table>
Main Switch Key at START Position
1. Turn and hold the main switch key at the START position.
2. Measure the resistances with an ohmmeter across the B terminal and the G terminal, across the B terminal and the ST terminal and across the B terminal and the AC terminal.
3. If 0 ohm is not indicated, these contacts of the main switch are faulty.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>B terminal – G terminal</th>
<th>B terminal – ST terminal</th>
<th>B terminal – AC terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0 ohm</td>
<td>0 ohm</td>
<td>0 ohm</td>
</tr>
</tbody>
</table>

Check for Mismatching of the Shuttle and PTO Limit Switches
1. Disconnect the leads from shuttle and PTO limit switches.
2. Measure the resistance with an ohmmeter across the limit switch wiring lead and lead.
3. If the ohmmeter reads 0 ohm when the shift lever is in neutral, and infinity when the lever is in other positions, it is an indication that the switch is normal.

(1) Shuttle Limit Switch  (2) PTO Limit Switch

Checking Starter Relay
1. Remove the starter relay (1).
2. Apply battery voltage across terminals 2 and 4, and check for continuity across terminals 1 and 3.
3. If continuity is not established across terminals 1 and 3, renew the starter relay.

(1) Starter Relay
**Glow Controller**

1. Turn the main switch off.
2. Disconnect the connector from glow controller (1).
3. Check the following using the 6P connector of the wire harness.
4. In cases where all the inspection results are correct but the glow controller does not operate normally, replace the glow controller.

**1) Main Switch ON Position**

1. Turn the main switch on.
2. Measure the voltage across the terminal 4 and terminal 5 of the wiring harness or the terminal 2 and chassis.
3. The battery is normal if the voltage is 11 to 14 volts. If faulty, inspect the main switch, easy checker, glow relay, and wiring harness.

**2) Main Switch Starting Position**

1. Hold the main switch at the starting position.
2. Measure the voltage across the terminal 6 and chassis.
3. The battery is normal if the voltage is 11 to 14 volts. If the voltage is not in this range, inspect the main switch and wiring harness.

(1) Glow Controller

**Glow Relay**

**1) Connector Voltage**

1. Turn the main switch off.
2. Disconnect the 1P connectors and 2P connector from glow relay (1).
3. Measure the voltage with a voltmeter across the 1P connector R terminal (Positive) and chassis (Negative).
4. If the voltage differs from the battery voltage, the wiring harness is faulty.
5. Turn the main switch on.
6. Measure the voltage with a voltmeter across the 2P connector RW terminal (Positive) and chassis (Negative).
7. If the voltage differs from the battery voltage, the wiring harness is faulty.

**2) Glow Relay Test**

1. Remove the glow relay (1).
2. Apply battery voltage across terminals 3 and 4, and check for continuity across terminals 1 and 2.
3. If continuity is not established across terminals 1 and 2, replace the glow relay (1).

(1) Glow Relay

**Water Temperature Sensor Continuity**

1. Disconnect the connector from the water temperature sensor.
2. Measure the resistance with an ohmmeter.
3. If the measurement is not indicated, the sensor is faulty.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Reference value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approx. 16.2 kΩ at −20 °C (−4 °F)</td>
<td></td>
</tr>
<tr>
<td>Approx. 3.88 kΩ at 0 °C (32 °F)</td>
<td></td>
</tr>
<tr>
<td>Approx. 2.45 kΩ at 20 °C (68 °F)</td>
<td></td>
</tr>
<tr>
<td>Approx. 1.14 kΩ at 40 °C (104 °F)</td>
<td></td>
</tr>
<tr>
<td>Approx. 0.58 kΩ at 60 °C (140 °F)</td>
<td></td>
</tr>
<tr>
<td>Approx. 0.32 kΩ at 80 °C (176 °F)</td>
<td></td>
</tr>
</tbody>
</table>
Glow Plug
1. Disconnect the leads from the glow plugs.
2. Measure the resistance with an ohmmeter across the glow plug terminal and chassis.
3. If 0 ohm is indicated, the screw at the tip of the glow plug and the housing are short-circuited.
4. If the factory specification is not indicated, the glow plug is faulty.

<table>
<thead>
<tr>
<th>Glow plug resistance</th>
<th>Factory spec.</th>
<th>Approx. 0.5 ohms</th>
</tr>
</thead>
</table>

Starter Motor B Terminal Voltage
1. Measure the voltage with a voltmeter across the B terminal and chassis.
2. If the voltage differs from the battery voltage, the battery’s positive cable or the battery negative cable is faulty.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>B terminal – chassis</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
</table>

Motor Test

⚠️ CAUTION
- Secure the starter in a vise to prevent it from jumping up and down while testing the motor.
1. Disconnect the ground cable clamp from the battery negative terminal post.
2. Disconnect the battery positive cable and the leads from the starter.
3. Remove the starter motor from the engine.
4. Disconnect the connecting lead (1) from the starter C terminal.
5. Connect a jumper lead from the connecting lead (1) to the battery positive terminal post.
6. Connect a jumper lead momentarily between the starter motor housing and the battery negative terminal post.
7. If the motor does not run, check the motor.

Magnet Switch Test (Pull-in, Holding Coils)
1. Remove the motor from the starter housing.
2. Prepare a 6 V battery for the test.
3. Connect jumper leads from the battery negative terminal to the housing and the starter C terminal.
4. The plunger should be attached and the pinion gear should pop out when a jumper lead is connected from the battery positive terminal to the S terminal. It’s a correct.
5. Disconnect the jumper lead to the starter C terminal. Then the pinion gear should remain popped out. It’s a correct.

**IMPORTANT**
- Testing time must be 3 to 5 sec.
DISASSEMBLING AND ASSEMBLING

Disassembling Motor
1. Disconnected the connecting lead (8) from the magnet switch (1).
2. Remove the through screws (6), and then separate the end frame (5), yoke (3) and armature (2).
3. Remove the two screws (7), and then take out the brush holder (4) from the end frame (5).

(When reassembling)
- Apply grease to the spline teeth (A) of the armature (2).

[A] Spline Teeth
(1) Magnet Switch  (6) Screws
(2) Armature  (7) Screws
(3) Yoke  (8) Connecting Lead
(4) Brush Holder  (9) Nut
(5) End Frame

Disassembling Magnet Switch
1. Remove the drive end frame (1) mounting screws.
2. Take out the over running clutch (2), ball (3), spring (4), gear (5), rollers (6) and retainer (7).

(When reassembling)
- Apply grease to the gear teeth of the gear (5) and over running clutch (2), and ball (3).

(1) Drive End Frame  (5) Gear
(2) Over Running Clutch  (6) Rollers
(3) Ball  (7) Retainer
(4) Spring

Plunger
1. Remove the end cover (1).
2. Take out the plunger (2).

(1) End Cover  (2) Plunger

SERVICING

Bearing and Clutch
1. Check the bearing and the clutch for smooth rotation.
   The clutch should engage and rotate with the pinion shaft in the forward driving direction and disengage in reverse.
Commutator and Mica
1. If the commutator surface is dirty or dusty, clean it with sandpaper.
2. Measure the commutator O.D. with an outside micrometer at several points.
3. If the minimum O.D. is less than the allowable limit, replace the armature.
4. If the difference of the outer diameters exceeds the allowable limit, use a lathe to adjust the outer diameter to within the allowable limit.
5. Measure the mica undercut.
6. If the undercut is less than the allowable limit, correct it with a saw blade and chamfer the segment edges.

| Commutator O.D. | Factory spec. | 30.0 mm
|                 |               | 1.181 in. |
|                 | Allowable limit | 29.0 mm
|                 |               | 1.142 in. |

| Difference of max. O.D. and min. O.D. | Factory spec. | Less than 0.02 mm
|                                       |               | 0.0008 in. |
|                                       | Allowable limit | 0.05 mm
|                                       |               | 0.0020 in. |

| Mica undercut | Factory spec. | 0.50 to 0.80 mm
|               |               | 0.019 to 0.031 in. |
|               | Allowable limit | 0.2 mm
|               |               | 0.008 in. |

Brush Wear
1. If the contact face of the brush is dirty or dusty, clean it with sandpaper.
2. Measure the brush length.
3. If the length is less than the allowable limit, replace it.

| Brush length | Factory spec. | 15.6 mm
|             |               | 0.611 in. |
|             | Allowable limit | 11.6 mm
|             |               | 0.453 in. |

Brush Holder
1. Measure the resistance with an ohmmeter across the brush holder and the holder support.
2. If infinity is not indicated, replace them as a unit.

| Resistance | Brush holder – Holder support | Infinity |
# Armature Coil

1. Measure the resistance with an ohmmeter across the commutator and the armature shaft.
2. If infinity is not indicated, replace them as a unit.

<table>

</tbody>
</table>

(a) From Main Switch AC Terminal (b) From Battery Positive Terminal

(1) Timer Relay

Test of Timer Relay
1. Remove the timer relay from the tractor.
2. Connect jumper leads across the battery positive terminal and the timer relay 3 terminal, and across the battery positive terminal and the timer relay 4 terminal.
3. Connect jumper leads across the battery negative terminal and the timer relay 2 terminal, and across the battery negative terminal and the bulb terminal.
4. Connect jumper lead across the timer relay 1 terminal and the bulb terminal.
5. The bulb lights up when disconnecting a jumper lead from the 3 terminal and goes off 6 to 13 seconds later, the timer relay is proper.

(1) Timer Relay
(2) Load (Lamp)
(3) Battery (12 V)
Fuel Cut Off Solenoid Lead Terminal Voltage
1. Disconnect the lead from the fuel cut off solenoid after turning the main switch off.
2. Turn the main switch ON.
3. Measure the voltage with a voltmeter across the lead terminal and the chassis just when the main switch is turned off.
4. If the battery voltage is not indicated for a certain seconds, check the wiring harness, the main switch, the timer relay, a fuse and the alternator.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Across lead terminal and chassis when main switch turned off</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
</table>

(a) To Timer Relay

Fuel Cut Off Solenoid Test
1. Disconnect the lead from the fuel cut off solenoid after turning the main switch off.
2. Connect jumper leads from the battery positive terminal to the fuel cut off solenoid lead terminal.
3. If the solenoid plunger is not attracted, the fuel cut off solenoid is faulty.

(1) Battery (12 V)
[4] CHARGING SYSTEM

CHECKING

**Alternator**
1.Disconnect the 2P connector (3) from alternator after turning the main switch OFF.
2. Perform the following checkings.
   (1) B Terminal
   (2) Alternator
   (3) 2P Connector

**Connector Voltage**
1. Turn the main switch OFF. Measure the voltage across the B terminal (1) and chassis.
2. Turn the main switch ON. Measure the voltage across the IG terminal (3) and chassis.

<table>
<thead>
<tr>
<th>Voltage (Main switch at OFF)</th>
<th>B terminal – Chassis</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage (Main switch at ON)</td>
<td>IG terminal lead – Chassis</td>
<td>Approx. battery voltage</td>
</tr>
</tbody>
</table>

(1) B Terminal
(2) Alternator
(3) IG Terminal
(4) L Terminal

**No-Load Test**
1. Connect the 2P connector (6) to previous positions of the alternator after turning the main switch OFF.
2. Connect the jumper lead (3) between IG terminal (4) and B terminal (2).
3. Start the engine and then set the idling speed.
4. Disconnect the negative cable from the battery.
5. Measure the voltage across the B terminal (2) and the chassis.
6. If the measurement is less than the factory specification, disassemble the alternator and check the IC regulator.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>B terminal – Chassis</th>
<th>More than 14 V</th>
</tr>
</thead>
</table>

(Reference)
- Once the engine has started, the alternator temperature rose quickly up to an ambient temperature of 70 to 90 °C (158 to 194 °F). As the temperature goes higher than 50 °C (122 °F), the alternator voltage slowly drops; at higher than 100 °C (212 °F), it drops by about 1 V.
DISASSEMBLING AND ASSEMBLING

**Pulley**
1. Secure the hexagonal end of the pulley shaft with a double-ended ratchet wrench as shown in the figure, loosen the nut with a socket wrench and remove it.

<table>
<thead>

**Rear End Cover**
1. Unscrew the three rear end cover screws and the terminal B nut and remove the rear end cover.

**Brush Holder**
1. Unscrew the two screws holding the brush holder and remove the brush holder.

**IC Regulator**
1. Unscrew the three screws holding the IC regulator (1) and remove it.

(1) IC Regulator

**Rectifier**
1. Remove the four screws holding the rectifier (1) and the stator lead wires.

(1) Rectifier
Rear End Frame
1. Remove the two nuts and two screws holding the drive end frame and the rear end frame.
2. Remove the rear end frame (1).
   (1) Rear End Frame

Rotor
1. Press out the rotor (2) from drive end frame (4).

■ IMPORTANT
- Take special care not to drop the rotor and damage the slip ring or fan, etc.
   (1) Press
   (2) Rotor
   (3) Block
   (4) Drive End Frame

Retainer Plate
1. Remove the screws holding the retainer plate and remove the retainer plate (1).
   (1) Retainer Plate

Bearing on the Drive End Side
1. Press out the bearing from drive end frame (4) using with press (1) and jig (2).
   (1) Press
   (2) Jig
   (3) Block
   (4) Drive End Frame

Bearing at the Slip Ring Side
1. Lightly secure the rotor (1) with a vise (2) to prevent damage and remove the bearing using with puller (4).
   (1) Rotor
   (2) Vise
   (3) Bearing
   (4) Puller
SERVICING

Bearing
1. Check the bearing for smooth rotation.
2. If it does not rotate smoothly, replace it.

Stator
1. Measure the resistance with an ohmmeter across each lead of the stator coil.
2. If the measurement is not within factory specification, replace it.
3. Check the continuity across each stator coil lead and core with an ohmmeter.
4. If infinity is not indicated, replace it.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Factory spec.</th>
<th>Less than 1.0 ohms</th>
</tr>
</thead>
</table>

Rotor
1. Measure the resistance across the slip rings.
2. If the resistance is not the factory specification, replace it.
3. Check the continuity across the slip ring and core with an ohmmeter.
4. If infinity is not indicated, replace it.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Factory spec.</th>
<th>2.9 ohms</th>
</tr>
</thead>
</table>

Slip Ring
1. Check the slip ring for score.
2. If scored, correct with an sand paper or on a lathe.
3. Measure the outside diameter of slip ring with a vernier caliper.
4. If the measurement exceeds the allowable limit, replace it.

<table>
<thead>
<tr>
<th>Slip ring O.D.</th>
<th>Factory spec.</th>
<th>14.4 mm 0.567 in.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowable limit</td>
<td>12.8 mm 0.504 in.</td>
<td></td>
</tr>
</tbody>
</table>

Brush Wear
1. Measure the length of brush with a vernier caliper.
2. If the measurement is less than allowable limit, replace it.
3. Make sure that the brush moves smoothly.
4. If the brush is defective, replace it.

<table>
<thead>
<tr>
<th>Brush length</th>
<th>Factory spec.</th>
<th>10.5 mm 0.413 in.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowable limit</td>
<td>8.4 mm 0.331 in.</td>
<td></td>
</tr>
</tbody>
</table>
Rectifier
1. Check the continuity across each diode of rectifier with an analog ohmmeter. Conduct the test in the (R x 1) setting.
2. The rectifier is normal if the diode in the rectifier conducts in one direction and does not conduct in the reverse direction.

**IMPORTANT**
- Do not use a 500 V megger for measuring because it will destroy the rectifier.

**NOTE**
- Do not use an auto digital multimeter. Because it's very hard to check the continuity of rectifier by using it.

IC Regulator
1. Check the continuity across the B terminal and the F terminal of IC regulator with an analog ohmmeter. Conduct the test in the (R x 1) setting.
2. The IC regulator is normal if the IC regulator conducts in one direction and does not conduct in the reverse direction.

**IMPORTANT**
- Do not use a 500 V megger for measuring because it will destroy the IC regulator.

**NOTE**
- Do not use an auto digital multimeter. Because it's very hard to check the continuity of IC regulator by using it.

IC Regulator Test
1. Connect the IC regulator unit, variable DC source, voltmeter, lamps and etc. so that they form a circuit as shown in the figure. (SW1 and SW2 shall be kept in the "OFF" position.)
2. Adjust the source voltage to 12 V.
3. Turn SW1 "ON" check if L1 (charge lamp substitution) is lit brilliantly and L2 (rotor coil substitution) is dimly.
4. Then, turn SW2 "ON" while SW1 is still turned "ON". Check if L1 is turns "OFF" and L2 is lit brilliantly.
5. While keeping SW1 and SW2 in the "ON" position, raise the variable DC source voltage gradually from 12 V and check if the L2 lamp is turned "OFF" at a voltage of 13.9 to 15.1 V at 25 °C (45 °F).

**IMPORTANT**
- A wrong connection in the IC regulator may destroy the regulator in a short time, therefore, inspection of the IC regulator is to be done only after the wiring diagram in the maintenance standard has been thoroughly studied.

[5] LIGHTING SYSTEM

CHECKING

Combination Switch
1. Remove the meter panel, and disconnect the combination switch connectors after turning the main switch off.
2. Perform the following checkings.
   (1) Combination Switch
Connector Voltage
1. Disconnect the connector from the combination switch (1) after turning the main switch OFF.
2. Turn the main switch ON, and measure the voltage with a voltmeter across the connector B1 terminal and the chassis.
3. If the voltage differs from the battery voltage, the wiring harness or main switch is faulty.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>B1 – Chassis</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
</table>

(a) From Main Switch AC Terminal
(1) Combination Switch

Head Light Switch Continuity When Setting Switch Knob at OFF Position
1. Disconnect the connector from the combination switch after turning the main switch OFF.
2. Set the light switch knob to the OFF position.
3. Measure the resistances with an ohmmeter across the B1 terminal and 1 terminal, across the B1 terminal and 2 terminal, and across the B1 terminal and the T terminal.
4. If infinity is not indicated, the combination switch is faulty.

<table>
<thead>
<tr>
<th>Resistance Switch knob at OFF position</th>
<th>B1 terminal – 1 terminal</th>
<th>Infinity</th>
</tr>
</thead>
<tbody>
<tr>
<td>B1 terminal – 2 terminal</td>
<td>Infinity</td>
<td></td>
</tr>
<tr>
<td>B1 terminal – T terminal</td>
<td>Infinity</td>
<td></td>
</tr>
</tbody>
</table>

Head Light Switch Continuity When Setting Switch Knob at LOW-BEAM Position
1. Measure the resistances with an ohmmeter across the B1 terminal and 2 terminal, and across the B1 terminal and T terminal.
2. If 0 ohm is not indicated, the combination switch is faulty.

<table>
<thead>
<tr>
<th>Resistance Switch knob at LOW-BEAM position</th>
<th>B1 terminal – 2 terminal</th>
<th>0 ohm</th>
</tr>
</thead>
<tbody>
<tr>
<td>B1 terminal – T terminal</td>
<td>0 ohm</td>
<td></td>
</tr>
</tbody>
</table>

Head Light Switch Continuity When Setting Switch Knob at HI-BEAM Position
1. Measure the resistances with an ohmmeter across the B1 terminal and 1 terminal, and across the B1 terminal and T terminal.
2. If 0 ohm is not indicated, the combination switch is faulty.

<table>
<thead>
<tr>
<th>Resistance Switch knob at HI-BEAM position</th>
<th>B1 terminal – 1 terminal</th>
<th>0 ohm</th>
</tr>
</thead>
<tbody>
<tr>
<td>B1 terminal – T terminal</td>
<td>0 ohm</td>
<td></td>
</tr>
</tbody>
</table>
Hazard Light Switch Continuity When Setting Switch Lever at OFF Position
1. Disconnect the connector from the combination switch after disconnecting the negative cable from the battery.
2. Set the hazard light switch to the OFF position.
3. Measure the resistance from the ohmmeter across the B2 terminal and R terminal.
4. If infinity is not indicated, the combination switch is faulty.

<table>
<thead>
<tr>
<th>Resistance Switch lever at OFF position</th>
<th>B2 terminal – R terminal</th>
<th>Infinity</th>
</tr>
</thead>
</table>

Hazard Light Switch Continuity When Setting Switch Lever at ON Position
1. Set the hazard light switch to the ON position.
2. Measure the resistance with an ohmmeter across the B2 terminal and R terminal.
3. If 0 ohm is not indicated, the combination switch is faulty.

<table>
<thead>
<tr>
<th>Resistance Switch lever at R position</th>
<th>B2 terminal – R terminal</th>
<th>0 ohm</th>
</tr>
</thead>
</table>

Hazard Unit Connector Voltage
1. Disconnect the connector from the hazard unit after disconnecting the negative cord from the battery.
2. Connect the negative cord to the battery, and measure the voltage with a voltmeter across the connector B terminal and E terminal.
3. If the voltage differs from the battery voltage, the main switch, fuse or wiring harness is faulty.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>B terminal – E terminal</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
</table>

(a) From Main Switch B Terminal
(1) Hazard Unit
Hazard Unit Test
1. Remove the hazard unit from the tractor.
2. Connect jumper leads from the L terminal to the bulb, and from the bulb to the battery negative terminal.
3. Connect jumper lead from the B terminal to the battery positive terminal.
4. Connect jumper lead from the E terminal to the battery negative terminal.
5. If the bulb does not flicker, the hazard unit is faulty.

(1) Hazard Unit
(2) Battery (12 V)
(3) Bulb (27 V)

[6] WARNING LAMPS
CHECKING

Engine Oil Pressure Switch Panel Board and Wiring Harness
1. Disconnect the lead from the engine oil pressure switch after turning the main switch OFF.
2. Turn the main switch ON and connect a jumper lead from the lead to the chassis.
3. If the engine oil pressure indicator lamp does not light, the panel board circuit or the wiring harness is faulty.

(a) From Oil Pressure Lamp
(1) Engine Oil Pressure Switch

Engine Oil Pressure Switch Continuity
1. Measure the resistance with an ohmmeter across the switch terminal and the chassis.
2. If 0 ohm is not indicated in the normal state, the switch is faulty.
3. If infinity is not indicated at pressure over 4.9 kPa (0.5 kgf/cm², 7 psi), the switch is faulty.

<table>
<thead>
<tr>
<th>Resistance Switch terminal – Chassis</th>
<th>In normal state</th>
<th>0 ohm</th>

(1) Air Cleaner Sensor

Parking Brake Switch Panel Board and Wiring Harness
1. Disconnect the leads from the parking brake switch (1) after turning the main switch OFF.
2. Turn the main switch ON and connect a jumper lead between the leads.
3. If the parking brake indicator lamp does not light, the panel board circuit or wiring harness is faulty.

(1) Parking Brake Switch
Parking Brake Switch Continuity
1. Disconnect the leads from the parking brake switch (1) after turning the main switch OFF.
2. Measure the resistance with an ohmmeter across the two terminals.
3. If infinity is not indicated, the switch is faulty.

<table>
<thead>
<tr>
<th>Resistance Across switch terminals</th>
<th>In normal state</th>
<th>Infinity</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) Parking Brake Switch</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Charging Circuit (Panel Board and Wiring Harness)
1. Disconnect the 2P connector from the alternator after turning the main switch OFF.
2. Turn the main switch ON and connect a jumper lead from the wiring harness connector terminal (WR) to the chassis.
3. If the charge lamp does not light, the panel board circuit, alternator, wiring harness, or fuse is fault.

(a) From Charge Lamp
(1) Alternator
Fuel Level Sensor Continuity
1. Remove the fuel level sensor from the fuel tank.
2. Measure the resistance with an ohmmeter across the sensor terminal and its body.
3. If the measurement are not indicated, the sensor is faulty.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Factory spec.</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td></td>
<td>Approx. 149 ohms at 50 °C (122 °F)</td>
</tr>
</tbody>
</table>

(1) Coolant Temperature Sensor

Fuel Gauge and Coolant Temperature Gauge Continuity
1. Remove the panel board from the tractor.
2. Check the continuity with an ohmmeter across the FU terminal (2) and IG terminal (3) and across the FU terminal (2) and GND terminal (4).
3. If infinity is indicated, the fuel gauge is faulty.
4. Check the continuity with an ohmmeter across the TU terminal (1) and IG terminal (3) and across the TU terminal (1) and GND terminal (4).
5. If infinity is indicated, the coolant temperature gauge is faulty.

(1) TU Terminal
(2) FU Terminal
(3) IG Terminal
(4) GND Terminal
SAFETY DECALS

- The following safety decals are installed on the machine. If a decal becomes damaged, illegible or is not on the machine, replace it. The decal part number is listed in the parts list.

**NOTE**
- Only labels applied to places other than where they are applied on tractors with no cabin are mentioned.

---

**CAUTION**

\[
\text{TO AVOID PERSONAL INJURY:}
\]
1. Read and understand the operator’s manual before operation.
2. Before starting the engine, make sure that everyone is at a safe distance from the tractor and that the PTO is OFF.
3. Do not allow passengers on the tractor at any time.
4. Before allowing other people to use the tractor, have them read the operator’s manual.
5. Check the tightness of all nuts and bolts regularly.
6. Keep all shields in place and stay away from all moving parts.
7. Lock the two brake pedals together before driving on the road.
8. Slow down for turns, or rough roads, or when applying individual brakes.
9. On public roads use SMV emblem and hazard lights, if required by local traffic and safety regulations.
10. Pull only from the drawbar.
11. Before dismounting, lower the implement, set the parking brake, stop the engine and remove the key.

---

**WARNING**

\[
\text{TO AVOID INJURY OR DEATH FROM ROLL-OVER:}
\]
Always use seat belt when driving.

---
Part No. TA240-4933-2

BEFORE DISMOUNTING TRACTOR:

1. ALWAYS SET PARKING BRAKE.
   Leaving transmission in gear with the engine stopped will not prevent tractor from rolling.
2. PARK ON LEVEL GROUND WHENEVER POSSIBLE.
   If parking on a slope, position tractor across the slope.
3. LOWER ALL IMPLEMENTS TO THE GROUND.
   Failure to comply to this warning may allow the wheels to slip, and could cause injury or death.
4. STOP THE ENGINE.

[3] CHECK AND MAINTENANCE

⚠️ CAUTION

- Be sure to check and service the tractor on a flat place with engine shut off, the parking brake on and chock the wheels.

12190G00030

(1) Daily Check

Cleaning Insect Control Mesh (For Condenser)
1. Roll up the insect control mesh (1) from below and clean.
2. Finally straighten the mesh down along the condenser.

(1) Insect Control Mesh

12190G00040
(2) Check Points of Every 200 Hours

**Adjusting Air Conditioner Belt Tension**

⚠️ **CAUTION**
- Be sure to stop the engine before checking air conditioner belt tension.
1. Stop the engine and remove the key.
2. Apply 98 N (10 kgf, 22 lbs) pressure to the belt between the pulleys.
3. If tension is incorrect, adjust the belt tension.
4. If belt is damaged, replace it.

<table>
<thead>
<tr>
<th>Air conditioner belt tension</th>
<th>Factory spec.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>A deflection of between 10 to 12 mm (0.39 to 0.47 in.) when the belt is pressed in the middle of the span</td>
</tr>
</tbody>
</table>

**Adjustment**
1. Disconnect the battery negative cord.
2. Remove the alternator upper mounting screw, then loosen the alternator lower mounting screw and nut.
3. Remove the fan belt from alternator pulley.
4. Loosen the air conditioner belt tension pulley nut (1).
5. Tighten the adjusting nut (2) to adjust the air conditioner belt tension.

(1) Tension Pulley Nut (A) Deflection
(2) Adjusting Nut

**Checking Air Conditioner Condenser**
1. Check the air conditioner condenser (1).
2. If dust and dirt, wash off all dirt and dust from the condenser (1) with a soft brush, use care not to damage or bend the fins.

(1) Air Conditioner Condenser

**Cleaning Fresh Air Filter**
1. Remove the knob bolts (3) and pull out filter (1).

⚠️ **NOTE**
- Do not hit the filter. If the filter becomes deformed, dust may enter into the air-conditioner, which may cause damage and malfunction.
- Do not use gasoline, thinner or similar chemicals to clean the filter as damage to the filter may occur.
- It may also cause an unpleasant odor in the CAB when the system is used next.

(1) Fresh Air Filter (A) Air Inner Port
(2) Cover
(3) Knob Bolt
Cleaning Inner Air Filter
1. Remove the inner air filter (1), and blow air from the direction opposite to the filter’s normal flow.

(1) Inner Air Filter 

Checking Air Conditioner Pipe and Clamp
1. Check to see that all lines and hose clamps are tight and not damaged.
2. If hoses and clamps are found worn or damaged, replace or repair them at once.

Checking Cabin Isomount
1. Check the isomounts (1) for any breakage or fatigue.
2. Replace them if they have deteriorated.

Lubricating Door and Rear Window Hinge
1. Apply a small amount of lubricating liquid to the following points when it is necessary.

(1) Door Hinge 
(2) Rear Window Hinge

Adjusting Washer Liquid
1. Add a proper amount of automobile washer liquid when it is necessary.

[4] SPECIAL TOOLS

- Special tools for R134a refrigerant air conditioning system introduced below are available from NIPPONDENSO CO. LTD.

Air Conditioner Service Tool
- Code No: NIPPONDENSO 95048-00061
- Application: Use for charging, testing or discharging the air conditioning system.

Electric Gas Leak Tester
- Code No: NIPPONDENSO 95146-00060
- Application: Use for gas leak testing the air conditioning system.

Vacuum Pump
- Code No: NIPPONDENSO 95046-00040 (AC220V)
- 95046-00050 (AC240V)
- Application: Use for evacuating the air conditioning system.

(1) Adaptor (For 134a)  (2) Vacuum Pump
Adaptor (For R134a)
Code No:  NIPPONDENSO 95048-10190 (AC220V)
          95048-10200 (AC240V)
Application: Use for evacuating the air conditioning system.

[3] LIGHTING SYSTEM

The lighting system consists of combination switch (light switch and turn signal switch), head lights, tail lights, position lights, panel board illuminations, hazard (turn signal) lights, hazard unit, hazard switch, relays, stop lamp switch, stop lamps, working light switch, working lights, etc.
(1) Head Light

When the main switch (1) is turned ON, the current from terminal AC flows to B1 terminal of the light switch (8).

When you set the light switch (8) to the HIGH-beam position, current flows from 1 terminal to the head lights (HIGH-beam) (13) and turns the lights on. This also holds true for when the light switch (8) is at the LOW-beam position.

Current also flows from T terminal to the position lights (12), tail lights (11), and panel board illuminations (5) for lighting on regardless of whether the light switch (8) is at the HIGH-beam or LOW-beam position.
When the hazard switch (20) is turned **ON**, current from the battery (3) becomes intermittent current at the hazard unit (10), and flows to the hazard relay (17) and A terminal of the hazard switch (20).

Intermittent current from **C** terminal of the hazard switch (20) flows simultaneously to turn signal relays (18), (19) and hazard (turn signal) lights (15), (16) and hazard (turn signal) indicator lamps (6) blink on and off. The indicator lamp of the hazard switch (20) also blinks on and off at the same time.
(3) Turn Signal Light

Right Turning
When the main switch (1) is turned ON and the turn signal switch (9) is set to "R", current from AC terminal flows to the coil of the hazard relay (17) and the coil of the turn signal relay (RH) (18), and both relays are switched to 4 terminal.

Current from the battery (3) flows to the hazard unit (10), becomes intermittent current, flows to 4 terminal of the turn signal relay (RH) (18), and the hazard (turn signal) lights (RH) (16) and hazard (turn signal) indicator lamp (RH) blink on and off.

Left Turning
Same as with right turning.

12190M00040
(4) Hazard with Turn Signal Light

When you turn the main switch (1) ON, and set the turn signal switch (9) to “R” while the hazard light is actuated, the current from AC terminal of the main switch (1) flows to the coil of the hazard relay (17) and the coil of the turn signal relay (RH) (18), and both relays are switched to 4 terminal.

Current from the battery (3) flows simultaneously to the hazard unit (10) and 4 terminal of the hazard relay (17).

The current that flowed to the hazard unit (10) turns into intermittent current, flows to 4 terminal of the turn signal relay (RH) (18), causing the hazard (turn signal) lights (RH) (16) and the hazard (turn signal) indicator lamp (RH) to blink on and off.

Current from 4 terminal of the hazard relay (17) flows to A terminal of the hazard switch (20).

Current from C terminal of the hazard switch (20) flows to 4 terminal of the turn signal relay (LH) (19), turning the hazard (turn signal) lights (LH) (15) and hazard (turn signal) indicator lamp (LH) on. At the same time, the indicator lamp of the hazard switch (20) is also turned on. The same goes for when the turn signal switch (9) is set to “L”.

12190M00050
[4] AIR CONDITIONER SYSTEM

The air conditioner system operates using R134a refrigerant.

(1) Principles of Air Conditioner

(1)-1 Expansion and Evaporation

In the mechanical refrigeration system, the cool air is made by the following methods.

1. The high temperature and high pressure liquid refrigerant is stored in the container which is called receiver (1).
2. Then, the liquid refrigerant is released to evaporator (3) through a small hole, called expansion valve (2). At this time, temperature and pressure of the liquid refrigerant are lowered too, and some of the liquid refrigerant is changed to vapor.
3. The low temperature and low pressure refrigerant flows into the container, called evaporator. In the evaporator, the liquid refrigerant evaporates and removes heat from the surrounding air.

(1) Receiver  (3) Evaporator  
(2) Expansion Valve  (4) Pump

(1)-2 How to Condense Gaseous Refrigerant into Liquid

The mechanical refrigerant system changes the refrigerant from the gaseous state to the liquid state while it is passing through the evaporator.

When gas is compressed, both temperature and pressure increase. For example, when gaseous refrigerant is compressed from 0.21 MPa (2.1 kgf/cm², 30 psi) to 1.47 MPa (15 kgf/cm², 213 psi), temperature of the gaseous refrigerant rises from 0 °C (32 °F) to 70 °C (158 °F). The boiling point of refrigerant at 1.47 MPa (15 kgf/cm², 213 psi) is 62 °C (144 °F). So the temperature (70 °C, 158 °F) of compressed gaseous refrigerant is higher than the boiling point (62 °C, 144 °F) and also higher than the surrounding air. Therefore, the gaseous refrigerant can be converted into liquid state, releasing heat until its temperature drops to the boiling point. For example, 1.47 MPa (15 kgf/cm², 213 psi), 70 °C (158 °F) gaseous refrigerant can be liquefied by lowering the temperature by approx. 8 °C (46 °F).
(1)-3 Condensing Gaseous

In the mechanical refrigeration system, the liquefaction of refrigerant is achieved by raising the pressure and then by lowering the temperature. The gaseous refrigerant which leaves the evaporator is compressed by the compressor (1). In the condenser (2) the compressed gaseous refrigerant releases heat to the surrounding air and it condenses back into liquid. And then the liquid refrigerant returns to the receiver (3).

(1) Compressor  (3) Receiver
(2) Condenser

(1)-4 Refrigeration Cycle

1. The compressor (1) discharges high temperature and high pressure refrigerant that contains the heat absorbed from the evaporator (4) plus the heat created by the compressor in a discharge stroke.
2. This gaseous refrigerant flows into the condenser (2). In the condenser, the gaseous refrigerant condenses into liquid refrigerant.
3. This liquid refrigerant flows into the receiver (3) which stores and filters the liquid refrigerant till the evaporator requires the refrigerant.
4. By the expansion valve (5), the liquid refrigerant changes into low temperature, low pressure liquid and gaseous mixture.
5. This cold and foggy refrigerant flows to evaporator. Vaporizing the liquid in the evaporator, the heat from the warm air steam passing through the evaporator core is transferred to the refrigerant.
All the liquid will change into gaseous refrigerant in the evaporator and only heat-laden gaseous refrigerant is drawn into the compressor. Then the process is repeated again.

(1) Compressor  (4) Evaporator
(2) Condenser  (5) Expansion Valve
(3) Receiver

12190F00220
12190M00100
10-M11
(2) Outline of Air Conditioning System

The machine is equipped with a thin large-capacity air conditioner with outside air intake. Through the inside air filter (9) as well as the outside air filter (4), the air flows along between the outer roof (2) and the inner roof (8) and reaches the air conditioner unit (1). The air is then cooled and dehumidified by this unit.

The resulting air is heated to a comfortable level. In this way, the air being blown via the blow port can be kept at comfortable temperature and humidity.

The 3 front blow ports (5) can be opened and closed using the center knob of each port. The 4 side blow ports (7) are opened and closed using the mode lever on the control panel (6). With these ports open or closed, you can feel your head cool and your feet warm.

(2) Outer Roof          (6) Control Panel
(3) Inside/Outside Air Selection Damper  (7) Side Blow Port
(4) Outside Air Filter   (8) Inner Roof
(3) Refrigeration System

The refrigerant cycle of air conditioning system is as follows.

1. The gaseous refrigerant evaporated through the evaporator (3) is compressed in the compressor (5) to approx. 1.47 MPa (15 kgf/cm², 213 psi) and is also raised in temperature to approx. 70 °C (158 °F) and delivered to the condenser (7).

2. The gaseous refrigerant is cooled down through the condenser (7) to approx. 50 °C (122 °F) and delivered to the receiver (8) in the liquid state. At this time, heat removed from the cabin interior is extracted by means of the condenser (7).

3. The liquid refrigerant is collected in the receiver (8) for a certain period. At this time moisture are removed from the refrigerant by desiccant (9).

4. The liquid refrigerant after removing moisture and dust is jetted out of the small hole of the expansion valve (2) into the evaporator (3) as if it were distributed by an atomizer. Thus, the refrigerant is reduced in both pressure and temperature, and becomes easy to evaporate.

5. The refrigerant evaporates at 0 °C (32 °F) vigorously, taking heat from the surface of the pipes in the evaporator (3).

6. At this time, warm air in a cabin is drawn into the evaporator (3) by the blower motor and is passed over those pipes, transferring its heat to the refrigerant for evaporation. The air thus cooled is distributed to the cabin. (That is heat in a cabin is taken by the evaporator.)

(Reference)
- Since warm air in a cabin is cooled suddenly, water in the air is liquefied and removed, which means dehumidification is also performed.

7. The gaseous refrigerant from the evaporator (3) after having performed the cooling action is returned to the compressor (5), and is compressed to liquefy it (high pressure and high temperature). This cycle is repeated.

8. The air coming from the evaporator is fed to the air mixing doors, by which part of the air is introduced into the heater core (11). In doing so, the air temperature can be adjusted to a comfortable level. The air mixing doors are controlled through the cable connected with the control panel.
(3)-1 Compressor

The compressor (1) is installed on the engine and is driven by crank pulley through a belt.

The compressor is a pump designed to raise the pressure of refrigerant. Raising the pressure means raising the temperature. High temperature refrigerant vapor will condense rapidly in the condenser by releasing heat to the surrounding.

Compressors are roughly classified into two types; reciprocating type and swash plate type. This air conditioner system adopts swash plate type compressor.

Swash Plate Type Compressor

A number of paired piston at set on the swash plate in an interval of 72 degrees for 10 cylinders compressor. When one side of a piston is in a compression stroke, the other is in a suction stroke.

When the pressure inside piston becomes negative as the piston is lowered, the low pressure gas flows through the suction hole of the valve plate (7) to force down the suction valve (3), thereby sending refrigerant into each cylinder. The deflecting width of the suction valve (3) is determined by the notch in the cylinder (suction valve stopper) (5). When the piston goes into the compression stroke and the pressure exceeds that of high pressure side, the discharge valve (4) is pushed up to send out the high pressure gas from the compressor.

After the compression stroke is completed and the piston goes into the suction stroke, the high pressure gas on the discharge side holds the discharge valve to prevent the back flow of the gas from the high pressure side. In this way, the difference of high and low pressure can be maintained inside of the compressor.

The R type compressor has 5 pairs (10 cylinders) of pistons secured to the swash plate which is secured diagonally on the shaft. As the shaft rotates, the piston (6) reciprocates in the same direction as the shaft. Cylinders are arranged respectively on both sides of a pair of pistons and when the cylinder on one side is in compression stroke, the cylinder on the other side goes into suction stroke.
If the high pressure is abnormally high, the melt bolt dissolves, and the refrigerant is released into the atmosphere, and the system is maintained. At the time, all of the refrigerant in the system is released into the atmosphere.

Even in the worst case, the outflow of refrigerant is stopped at the minimum limit.

(Reference)
- In normal operation, the high pressure switch is triggered first and the compressor stops, so the pressure relief valve is not triggered so easily.

   (d) 4.14 MPa, 42.4 kgf/cm², 603.1 psi

A magnetic clutch is used to engage and disengage the compressor from the engine. Main components are stator (6) and rotor with pulley (5), and pressure plate (7) to engage the drive pulley (3) and compressor magnetically.

The stator is fixed on the compressor housing, and the pressure plate is attached to the compressor shaft. Two ball bearings are used between the inner surface of the rotor and the front housing of the compressor.

(1) Ball Bearing (5) Rotor W / Pulley
(2) Snap Ring (6) Stator
(3) Pulley (7) Pressure Plate
(4) Snap Ring

### Compressor Oil

The compressor oil dissolves in the refrigerant, circulates through the air-conditioning cycle, and functions to lubricate the compressor. But the conventional compressor oil for R12 doesn’t dissolve in R134a, so it doesn’t circulate through the cycle, and the lifespan of the compressor is considerably shortened.

It is still essential to ensure that the correct refrigerant oil is used. R12 systems were lubricated with mineral oil, which is totally unsuitable for R134a systems. The latter require PAG oil, which mixes very well with the refrigerant and provides ideal lubrication throughout the system.

(3)-2 Condenser

The condenser (1) is installed to the front of radiator (2) to enable forcible cooling by the air drawn in by the engine radiator fan.

The condenser is used for the purpose of cooling and robbing the heat from the refrigerant gas, which has been compressed by the compressor into high temperature, high pressure gas, so as to change this gas into liquid refrigerant.

The heat given off by the gaseous refrigerant in the condenser is the sum of the heat absorbed at the evaporator and the heat of work required by the compressor to compress the refrigerant. The greater the amount of heat give off in the condenser, the greater will be the cooling effect attainable by the evaporator.

(5) Vapor       (d) Cooled Liquid to Receiver
(6) Liquefying
(7) Liquefied

50 °C (122 °F)
(3)-3 Receiver

The receiver (2) serves the purpose of storing the liquid refrigerant. The amount of the liquid refrigerant flowing through the system varies with the operating condition of the air conditioner. To be accurate, the receiver stores excess amount of refrigerant when the heat load is lowered. It also releases stored refrigerant when additional cooling is needed, thus, maintaining the optimum flow of refrigerant within the system.

The receiver includes a desiccant (5). It has the job of removing moisture as the refrigerant circulates within the system.

The sight glass (3) is installed on the top of receiver. Amount of refrigerant to be charged is very important for the efficiency of air conditioner. The sight glass is used to check the amount of refrigerant. If large flow of bubbles can be seen in the sight glass, there is insufficient refrigerant charged. If so, replenish the refrigerant to the proper level.

(3)-4 Air Conditioner Unit

Air conditioner unit (1) consists of evaporator (3), expansion valve (4), heater core (2), blower (5), etc.

(1) Air Conditioner Unit  (4) Expansion Valve
(2) Heater Core  (5) Blower
(3) Evaporator
**Expansion Valve**

The expansion valve restricts the flow of liquid refrigerant as it passes through the expansion valve and delivers sprayed refrigerant to the evaporator for facilitating refrigerant evaporation.

The cabin interior will not be cooled sufficiently if the expansion valve outlet is too small. If it is too wide, frost will be produced on the evaporator, decreasing cooling efficiency. Thus the size of this small spray hole has to be controlled according to various conditions.

(1) Diaphragm Chamber
(2) Diaphragm
(3) Needle Valve
(4) Adjusting Screw
(5) Pressure Spring
(6) Tube
(7) Heat Sensitizing Tube
(8) Capillary Tube

(a) From Receiver
(b) To Evaporator
(c) From Evaporator
(d) To Compressor

When the vapor pressure of the operating system is stable, \( Pf = Pe + Ps \) condition will prevail. The needle valve opening at this time will be stationary and constant refrigerant flow will be maintained.

In the evaporator installing expansion valve, the refrigerant in the outlet is always in superheated vapor form for a certain length (part B in the figure). If the cooling load increases (inlet air temperature of evaporator becomes high), the refrigerant will vaporize faster and cause the length of the superheated vapor part L to become longer. Thus, the pressure in the heat sensitizing tube (7) rises and increases the needle valve opening, resulting in larger flow of the refrigerant into evaporator. Conversely, if the amount of refrigerant in the evaporator becomes greater, the length of the superheated vapor part L will become shorter. The pressure in the heat sensitizing tube will drop and decrease the needle valve (2) opening.

(8) Capillary Tube

(A) Saturated Vapor Part
(B) Superheated Vapor Part L
\( Pf \) : Gas pressure in sensitizing tube
\( Ps \) : Spring pressure
\( Pe \) : Vapor pressure in evaporator
■ Evaporator

The purpose of evaporator (2) is just opposite to that of the condenser. The state of refrigerant immediately after the expansion valve (3) is 100% liquid. As soon as the liquid pressure drops, it starts to boil, and in doing so, absorbs heat. This heat is removed from the air passing over the cooling fins of the evaporator and causes the air to cool.

If too much refrigerant is sent into the evaporator, it will not boil away so easily. Also, the evaporator filled with liquid refrigerant eliminates a place for the refrigerant to properly vaporize, which is necessary in order to take on heat. A flooding condition of the evaporator will allow an excess of liquid refrigerant to leave the evaporator and may cause serious damage to the compressor.

If too little refrigerant is sent into the evaporator, again the evaporator will not cool because the refrigerant will vaporize, or boil off, long before it passes through the evaporator.

Refrigerant properly metered into the evaporator should allow for 100% liquid just after the expansion valve, and 100% gas at the outlet.

3. Capillary Tube
4. Expansion Valve
5. Thremostat
6. Fin
7. Tube

■ Heater Core

The heater-sauce of heater utilizes cooling water which becomes high temperature by heat of engine.

The inlet port of heater core is connected to the delivery side of engine water pump by a rubber hose, and the water valve is installed on the inlet port of heater core. Also, the outlet port of heater core is connected to the engine cylinder block.

The heater core is one of the heat exchangers like evaporator or condenser, and heat is exchanged between heated cooling water passing through the core and air in the cabin or fresh outdoor air. Thus, air is heated.

1. Heater Core

■ Water Valve

The hot water valve (1) is connected with the hot water valve cable (2) and controlled with the temperature control lever on the control panel. This lever is used to adjust the flow rate of hot water going into the heater.

Set the temperature control lever to the COOL position and the hot water valve gets closed, allowing no hot water flow. The hot water valve is built in at the right-hand top of the center pillar.

1. Hot Water Valve
2. Hot Water Valve Cable
A/C Blower
The blower is incorporated in the right-hand space of the air conditioner unit. It blows cool, warm or fresh air via the front and side blow ports into the cabin.

The speed of the blower motor (1) can be adjusted in 3 steps by the resistor (2).

The blower fan (3) is of centrifugal type. The air being sucked in parallel with the rotary shaft is blown in the centrifugal direction; in other words, perpendicular to the rotary shaft.

(1) Blower Motor  (3) Blower Fan
(2) Resistor

Air Mixed Door · Mode Door
The air mixing doors (1) are fit at both sides of the heater in the air conditioner unit. The temperature control lever on the control panel is used to open and close the doors. Set this lever to the rightmost (WARM) position, and the air mixing doors get fully closed. All the air that is passing through the evaporator is heated up and fed to the blow ports. As this lever moves to the left (toward the COOL position), the air mixing doors open themselves gradually. This means that there will be more air not being heated. The hot water valve gradually closes at the same time, and the blown-air temperature will drop accordingly. Most of the air that does not pass through the heater but comes through the air mixing doors is blown out of the side blow ports. This helps you feel your head cool and your feet warm.

The mode doors (2) are provided at the inlets of the ducts that run to the right- and left-side blow ports, and are used to open and close the side blow ports.

(1) Air Mixing Door  (2) Mode Door

Refrigerant R134a

IMPORTANT
- The air conditioning system operates using R134a refrigerant. This substance does not contain any chlorine atoms, so it does not have a detrimental effect on the ozone in the Earth's atmosphere.
- Even so, the refrigerant must never be discharged straight into the air. It must be trapped in a recycling machine. Refrigerant stored in a recycling unit may be reused at any time.
- The recycling machine used to do this must be of a type suitable for handling R134a refrigerant.
- R134a has a corrosive effect on copper as well as various seals and components used in the R12 system. For this reason, never use R134a refrigerant in a system that has previously used R12. Before replacing any component, it is vital to check whether it is compatible with the type of refrigerant used.
Refrigerant Properties

Water boils at 100 °C (212 °F) under atmospheric pressure, but R134a boils at –26.5 °C (–15.7 °F) and its freezing point is –101 °C (–149.8 °F) below zero under atmospheric pressure.

If R134a were exposed and released to the air under normal room temperature and atmospheric pressure, it would absorb the heat from the surrounding air and boil immediately changing into gas. Also R134a is easily condensed back into liquid under the pressurized condition by removing heat from it.

The characteristic curve of R134a which expresses the relation between the temperature and pressure is shown in the figure left. The graph itself indicates the boiling point of R134a under each temperature and pressure. On the graph, the upper portion above the curve is gaseous state of R134a and the lower portion below the curve is liquid state of R134a. The gaseous refrigerant can be converted into the liquid refrigerant by raising the pressure without changing the temperature or decreasing the temperature without changing the pressure. (See (a) and (b) in the figure.) Conversely, the liquid refrigerant can be converted into the gaseous refrigerant by lowering the pressure without changing the temperature, or by raising the temperature without changing the pressure. (See (c) and (d).)

(1) Temperature  (A) GAS
(2) Gauge Pressure  (B) LIQUID
(4) System Control

1) Selection of recirculated air (7) or fresh air (5) is done with door D1.

- **RECIRC**
  By setting the air selection lever (16) in rear control panel to **RECIRC** position, door D1 (6) shuts the fresh air inlet port. Air inside the cabin is recirculated.

- **FRESH**
  By moving the air selection lever (16) to **FRESH** position, door D1 opens the fresh air inlet port. Outside air comes into cabin.

2) Temperature control of outlet air is done with door D2.

- **COOL**
  By setting the temperature control lever (4) in control panel to **COOL** position, door D2 (10) is moved to close water valve. The air flows to door D3 (12) side without passing the heater core.

- **WARM**
  By moving the temperature lever to **WARM** position, door D2 is moved to open water valve. The air flows to door D3 (12) side passing through the heater core.

3) Outlet air flow is controlled by door D3.
   Moving the air mode lever (1) opens and shuts door D3 and establishes the air passage according to the lever position.

- **DEF + FACE**
  By moving the mode lever to **DEF + FACE** position, the door D3 is moved to establish the air passages to outlets O1 and O2. Air comes out from both outlets.

- **DEF**
  Moving the mode lever to **DEF** position, door D3 is moved to set up the air passage to outlet O1. Air comes out from outlet O1.

O1 : Front air outlet
O2 : Side air outlet
The process of magnetic clutch being engaged is shown below.

Main Switch (3) **ON** → A/C Blower Switch (9) **ON** (Low, Medium or High) → A/C Switch (10) **ON** → Compressor Relay (11) **ON** → Thermostat (12) **ON** (the thermostat temperature is more than 4 °C (39.2 °F)) → Pressure Switch (13) **ON** (if refrigerant pressure is between 0.21 MPa (2.1 kgf/cm², 30 psi) and 265 MPa (27 kgf/cm², 384 psi) → Magnetic Clutch of Compressor Engaged.
(5)-2 Air Conditioner Relay, Blower Relays and Compressor Relay

Remove the outer roof and the relays are visible at the ceiling center of the cabin; blower HI relay (1), A/C relay (Blower LO relay) (2), blower ME relay (3) and compressor relay (4). When the blower fan is adjusted for the air flow rate, the blower HI relay is activated by a signal from the fan switch on the control panel.

Among the air conditioner components, current flows to the blower motor and magnetic clutch. If all of these current were to be passed through the main switch and supplied, the current would be too large for the main switch so that there will be danger or burning out the main switch contact. If the current were to be passed directly from the battery, forgetting to turn off the blower motor could result in a discharged battery.

To protect against such trouble, relays have been provided. These relays have been made so that when current flows through its coil, the contact close to supply the power from the battery. By employing these relays, the current flowing through the main switch has been decreased as only a small current is required to actuate the relays. Thus there will be no danger of burning out the switch contact, and when the main switch is opened, the relay contact will open at the same time. This action stops the current flow in the air conditioner circuit so that there will also be no chance of the battery discharging.

(5)-4 Pressure Switch

The pressure switch detects the pressure in the refrigerant cycle, and when something is wrong, turns off the magnetic clutch to prevent the component from troubling. This system has dual type pressure switch (2), and this switch controls low pressure cut and high pressure cut.

(1) A/C Unit  (2) Pressure Switch

1) Pressure Switch (Dual Type)

The pressure switch is installed in inlet line (liquid line) between receiver and expansion valve.

The contact of pressure switch is normally open type.

(1) Diaphragm  (6) Movable Contact
(2) Pin  (7) Spring
(3) Terminal  (a) Pressure
(4) Belleville Spring  (5) Plate
OFF Position : A (When the Refrigerant Pressure is Low)

The pressure switch detects the pressure drop when the refrigerant leaks from the system causing compressor seizure. When pressure of refrigerant is less than specified pressure, the switch is turned OFF and disengages magnetic clutch.

ON Position : B (When the Refrigerant Pressure is Normal)

When the pressure in the inlet line is between 0.196 MPa (2.0 kgf/cm², 28.4 psi) and 3.14 MPa (32 kgf/cm², 455 psi), the switch is turned ON (the pressure is normal condition), and engages magnetic clutch.

OFF Position : C (When the Refrigerant Pressure is High)

When the pressure in the inlet line is higher than specified pressure, the switch is turned OFF, and disengages magnetic clutch.

(Reference)

(5) Terminal

(a) Pressure

12190M00370
2) Circuit

The circuit of magnetic clutch including the pressure switches is as shown in the figure. All switches are connected in series. The magnetic clutch can be turned **ENGAGED** when the A/C blower switch and A/C switch are turned **ON** under the condition that both pressure switch and thermo switch are turned **ON**.
(5)-5 Thermostat

If the evaporator fin temperature, that is, refrigerant vaporizing temperature, drops below 0 °C (32 °F), frost or ice will form on the fins, causing a decrease in air flow and lowering cooling capacity. To prevent such frosting, and also to allow setting cabin interior to desired temperature, a thermostat has been installed.

In this system, gas type thermostat is used.

The gas type thermostat has a capillary tube which is filled with special gas. The capillary tube is connected to the diaphragm chamber. The tip of the capillary tube is positioned on the evaporator fins.

When the evaporator fins temperature is higher than setting temperature of the thermostat, the micro switch in the thermostat is turned ON by increasing the pressure in the diaphragm chamber. When the evaporator fins temperature is low, such as in winter season, the micro switch is turned OFF because of the pressure in the diaphragm chamber and spring tension drops, thus turning OFF the magnetic clutch to prevent the evaporator from frosting.

[5] WINDSHIELD WIPER

(1) Front Windshield Wiper

Front wiper motor is of the ferrite magnet type and possesses the function to stop the wiper arm at a designed position.

The wiper linkage changes rotating motion of the output shaft of the motor into reciprocating movement, which moves the wiper arm. The wiper arm uses a pantograph system, so the wiper blade keeps a certain angle (perpendicular) continuously although the wiper arm moves.

Wiping angle of the wiper arm is 2.90 rad. (166°). The wiper blade is for flat glass, and length of blade rubber is 400 mm (15.6 in.)

TROUBLESHOOTING-2

**Too low air flow rate**

1. **Symptom**: Too low air flow rate
2. **Inspection Item**: Does blower motor function?
   - **Normal**: No
   - **Yes**: Does blower motor run?
     - **No**: Blower fan switch defective
       - Blower relay defective
       - Brush in poor contact
       - Fuse blown out
       - Wrong wiring or loose connections
     - **Yes**: Does flow rate change in 3 steps?
       - **No**: Resistor defective
       - BRelay defective
       - Blower fan switch defective
     - **Yes**: Blower itself in trouble
       - Blower is not tightened enough
       - Blower deformed
       - Blower in contact with casing
       - Obstacle at or near suction port
       - Evaporator frosted
       - Filter clogged
       - Blow duct clogged or missing

**Air flow rate as specified, but no cooling**

1. **Symptom**: Air flow rate as specified, but no cooling
2. **Inspection Item**: Does compressor function?
   - **Normal**: No
   - **Yes**: Is belt tension as specified?
     - **No**: Belt slipping
     - **Yes**: Does magnetic clutch function?
       - **No**: Low battery voltage
       - Rotor in contact with stator
       - Wrong wiring loose connections
       - Replays misadjusted and defective
       - Coil shortage
       - Ground malfunction
       - Coil burst out
       - Compressor defective
     - **Yes**: Compressor in trouble
Symptom

Is cycle pressure as specified? No

Normal

Is high-pressure level as specified? No

Is low-pressure level as specified? No
too low

Probable Cause

Refrigerant overcharged 10-S13
Condenser clogged with dust and dirt –
Air mixed 10-S13
Refrigerant too short 10-S12
Compressor discharge valve damaged 10-S30
Compressor gasket damaged 10-S30
Low-pressure pipe in trouble (Cracked or clogged) 10-S30
EPR in trouble 10-S20
Refrigerant overcharged 10-S13
Heat-sensitive tube in poor contact –
Extension valve too open –
Refrigerant too short 10-S12
Gas leak at heat-sensitive tube –
Evaporator frosted 10-S43
Low-pressure pipe in trouble (Cracked or clogged) 10-S30
Expansion valve clogged –
EPR in trouble 10-S20
Refrigerant overcharged 10-S13
Refrigerant too short 10-S12

Are both high-pressure and low-pressure levels as specified? No
too high

Is temperature well controlled? No

Normal

Does temperature control lever function? No

Wire poorly fixed 10-S37
Wire wrongly laid 10-S37

Is water valve openness as specified? No

Valve wrongly open at Max COOL position 10-S37
Cable wrongly set 10-S37
Cable disconnected 10-S37

Is air mixing door openness as specified? No

Damper lever wrongly set 10-S37
Cable disconnected 10-S37

Is heater hose laid as specified? No

Hose caught 10-S41
Hose twisted or bent 10-S41

Check water leakage Abnormal

Is there water leak in cabin? Yes

Check two points (in cabin’s right-hand front and back) for drainage of water resulting from dehumidifying.

PRECAUTIONS AT REPAIRING REFRIGERANT CYCLE

When checking or repairing the air conditioning system, the following precautions and rules must be observed. And it is of first importance that no other personnel than a well-trained serviceman should be allow to handle the refrigerant.

CAUTION

- Since direct contact of the liquid refrigerant with your skin will cause frostbite, always be careful when handling the refrigerant. Always wear goggles to protect your eyes when working around the system.
- The refrigerant service container has a safe strength. However, if handled incorrectly, it will explode. Therefore, always follow the instructions on the label. In particular, never heat the refrigerant container above 40 °C (104 °F) or drop it from a high height.
- Do not steam clean on the system, especially condenser since excessively high pressure will build up in the system, resulting in explosion of the system.
- If you improperly connect the hose between the service valve of compressor and gauge manifold, or incorrectly handle the valves, the refrigerant service container or charging hose will explode. When connecting the hose or handling the valve, be sure to check the high pressure side or low pressure side.
- In case the refrigerant is charged while the compressor is operated, do not open the high pressure valve of the gauge manifold.
- Beware of the toxicity of the gas. The gas is harmless and nontoxic in its original state, however it produces a toxic substance when it comes in contact with high temperature parts and decomposes.
- Do not heat the service can unless necessary. When it has to be heated, use warm water of 40 °C (104 °F) or lower. Do not heat using boiling water.

IMPORTANT (Continued)

- Always keep the working place clean and dry and free from dirt and dust. Wipe off water from the line fittings with a clean cloth before disconnecting.
- Use only for R134a refrigerant service tool.
- Use for R134a refrigerant recovery and recycling machine when discharging the refrigerant.
- Before attaching the charging hose to the can tap valve of the refrigerant container, check each packing for clogging.
- When disconnecting the charging hose from the charging valve of compressor and receiver, remove it as quick as possible so that gas leakage can be minimized.
- Be sure to charge the specified amount of refrigerant, but not excessively. Over-charging of the refrigerant in particular may cause insufficient cooling, etc.
- Since the charging hose can be connected to can tap valve by hand, do not use a pliers for tightening it.
- Keep refrigerant containers in a cool and dark place avoiding such place which are subject to strong sunlight or high temperature.
- R134a compressor oil absorbs moisture easily, so that be sure to seal after disconnecting the each parts.
- Do not use old-type refrigerant R12a or compressor oil for old-type refrigerant.
- When replacing the condenser, evaporator and receiver, etc., replenish the compressor oil to compressor according to the table below.

HANDLING OF SERVICE TOOLS

(1) Manifold Gauge Set

The hand valves on the manifold gauge set are used to open and close the valve. The hand valve inscribed LO is for the low pressure side valve (3) and HI is for the high pressure side valve (4). By opening or closing the high and low pressure hand valves, the following circuits are established.

(1) LO Pressure Gauge
(2) HI Pressure Gauge
(3) LO Pressure Side Valve
(4) HI Pressure Side Valve
(5) Schrader Valve

- When LO Pressure Side Valve and HI Pressure Side Valve are Closed
  Two circuits are established.
  Port (C) → LO pressure gauge (1)
  Port (A) → HI pressure gauge (2)

- NOTE
  - Schrader valve must be opened.

- When LO Valve is Opened and HI Valve is Closed
  Two circuits are established.
  Port (C) → LO pressure gauge (1)
  Port (B) → Port (D)
  Port (A) → HI pressure gauge (2)

- NOTE
  - Schrader valve must be opened.

- When LO Valve is Closed and HI Valve is Opened
  Two circuits are established.
  Port (A) → HI pressure gauge (2)
  Port (B) → Port (D) (Schrader valve must be opened)
  Port (C) → LO pressure gauge (1)

- NOTE
  - Schrader valve must be opened.
When LO and HI Valves are Opened
Circuits are established.
Port (A) → LO pressure gauge (1)
          → HI pressure gauge (2)
          → Port (B)
          → Port (C)
          → Port (D) (Schrader valve must be opened)

NOTE
- Schrader valve must be opened.

(2) Refrigerant Charging Hose

The charging hoses are classified into three colors. Each charging hose must be handled as follows:
- The air conditioner manufacture recommends that the blue hose (3) is used for the LO pressure side (suction side), the green hose (5) for refrigeration side (center connecting port) and the red hose (4) for HI pressure side (discharged side).

(When connecting)
- Push the quick disconnect adaptor (6) into the charging valve, and push on part A until a click is heard.

NOTE
- When connecting, push carefully so the pipe doesn’t bend.
- When connecting the quick disconnect connector, should the sleeve (7) move before the quick link connector can be connected to the charging valve, move the quick sleeve to its original position and try again.
- When some refrigerant remains in the charging hose at the time of connections, it may be difficult to connect the quick link connector. In this case, perform the operation after removing any residual pressure in the hose. (Remove the residual pressure by pushing the pusher (8).)

(When reassembling)
- While holding on to part A of the quick disconnect adaptor, slide part B up.

NOTE
- After removing the adaptor, ensure to cap the quick disconnect adaptor service valve.

(1) LO Pressure Side Valve (7) Sleeve
(2) HI Pressure Side Valve (8) Pusher
(3) Blue Hose (9) Sleeve
(4) Red Hose
(5) Green Hose
(6) Quick Disconnect Adaptor (a) CLICK
(3) Vacuum Pump Adaptor

**Objective of the Vacuum Pump Adaptor**

1. After vacuum has been created in the air conditioning cycle, when the vacuum pump is stopped, since there is vacuum in hoses within the gauge manifold, the vacuum pump oil flows back into the charging hose. If the refrigerant is refilled with the system still in this state, the vacuum pump oil left in the charging hose enters the air conditioner cycle together with the refrigerant. Vacuum pump adaptor with a solenoid valve is used to prevent this back-flow of oil from the vacuum pump. The role of the solenoid valve is that when the current passes through the solenoid valve, the valve closes to keep out the outside air and allow the vacuum to build up, but when the current stops, the valve opens to allow in air and end the vacuum.

2. Attaching this adaptor to the R12 vacuum pump currently being used allows the pump to be used with both R134a and R12.

   (1) Vacuum Pump Adaptor       (6) For R134a
   (2) Vacuum Pump                (7) For R12
   (3) Magnetic Valve             (A) IN
   (4) Blind Cap                  (B) OUT

(4) Electric Gas Leak Tester

The current R12 gas leak tester has poor sensitivity for R134a and cannot be used. Therefore, a new electric gas leak tester with greater sensitivity has been designed and can be used with both R134a and R12.

**(Reference)**

Leak tester with halide torch
- Since the reaction with chlorine within the refrigerant is used to detect gas leaks, R134a, which contains no chlorine, cannot be detected.

   (1) Electric Gas Leak Tester

(5) Can Tap Valve

The can tap valve that is used to charge the refrigerant into the air conditioning system, should be used as follows:

1. Before putting the can tap valve on the refrigerant container, turn the handle (1) counterclockwise till the valve needle is fully retracted.
2. Turn the plate nut (disc) (4) counterclockwise till it reaches its highest position, then screw down the can tap valve into the sealed tap.
3. Turn the plate nut clockwise fully, and fix the center charging hose to the valve.
4. Tighten the plate nut firmly by hand.
5. Turn the handle (1) clockwise, thus making a hole in the sealed tap.
6. To charge the refrigerant into the system, turn the handle (1) counterclockwise. To stop charging, turn it clockwise.

   (1) Butterfly Handle       (3) Needle
   (2) Connection             (4) Disc
(6) T-joint

T-joint (2) is used to increase efficiency of gas charging using two refrigerant containers (4) at a time.
1. Install two refrigerant container service valves to T-joint (2) sides and connect the charging hose (1) to it.

   (1) Charging Hose (Green)   (3) Can Tap Valve
   (2) T-joint                  (4) Refrigerant Container

(7) R134a Refrigerant Recovery and Recycling Machine

When there is necessity of discharging the refrigerant on repairing the tractor, it should use recovery and recycling machine. (Don't release the refrigerant into the atmosphere.)

- **IMPORTANT**
- Use only R134a refrigerant recovery and recycling machine, eliminate mixing R134a equipment, refrigerant and refrigerant oils with R12 systems to prevent compressor damage.

CHECKING AND CHARGING REFRIGERANT CYCLE

[1] CHECKING WITH MANIFOLD GAUGE

- **IMPORTANT**
- The gauge indications described in the following testing are those taken under the same condition, so it should be noted that the gauge readings will differs somewhat with the ambient conditions.

  Condition
  - Ambient temperature : 30 to 35 °C (86 to 95 °F)
  - Engine speed : Approx. 1500 rpm
  - Temperature control lever : Maximum cooling position
  - Blower switch : HI position
Manifold Gauge Connecting and Test Preparation
1. Close the manifold gauge HI and LO pressure side valve (5), (4) tightly.
2. Connect the charging hose (6) (red) to the HI pressure side charging valve (1) and connect the charging hose (7) (blue) to the LO pressure side charging valve (2).

**NOTE**
- Be sure to drive out the air in the charging hoses at the manifold gauge connection end by utilizing the refrigerant pressure in the refrigerating cycle.
3. Start the engine and set at approx. **1500 rpm**.
4. Turn on the A/C switch and set the temperature control lever to **maximum cooling** position.
5. Set the blower switch to HI position.

(1) HI Pressure Side Charging Valve  (2) LO Pressure Side Charging Valve  (3) Manifold Gauge  (4) LO Pressure Side Valve  (5) HI Pressure Side Valve  (6) Charging Hose (Red)  (7) Charging Hose (Blue)

Normal Operating
If the refrigerating cycle is operating normally, the reading at the LO pressure side (1) should be generally by around 0.15 to 0.2 MPa (1.5 to 2.0 kgf/cm², 21 to 28 psi) and that at the HI pressure side (2) around 1.27 to 1.66 MPa (13 to 17 kgf/cm², 185 to 242 psi).

(1) LO Pressure Side  (2) HI Pressure Side

Insufficient Refrigerant
a) Symptoms seen in refrigerating cycle
- Both LO and HI pressure side (1), (2) pressures too low.
  - LO pressure side (1) : 0.05 to 0.1 MPa
    (0.5 to 1.0 kgf/cm², 7.1 to 14.2 psi)
  - HI pressure side (2) : 0.69 to 0.96 kPa
    (7 to 10 kgf/cm², 99.6 to 142.2 psi)
- Bubbles seen in sight glass.
- Air discharged from air conditioner slightly cold.
b) Probable cause
- Gas leaking from some place in refrigerant cycle.
c) Solution
- Check for leakage with electric gas leak tester (see page 10-S10) and repair.
- Recharge refrigerant to the proper level. (See page 10-S18)

(1) LO Pressure Side  (2) HI Pressure Side
**Excessive Refrigerant or Insufficient Condenser Cooling**

a) Symptoms seen in refrigerating cycle
   - Both LO and HI pressure side (1), (2) pressures too high.
     - LO pressure side (1): 0.2 to 0.35 MPa
       (2.0 to 3.5 kgf/cm², 28 to 49.8 psi)
     - HI pressure side (2): 1.96 to 2.45 MPa
       (20 to 25 kgf/cm², 284.5 to 355.6 psi)

b) Probable cause
   - Overcharging refrigerant into cycle.
   - Condenser cooling faulty.

c) Solution
   - Clean condenser. (See page 10-G2.)
   - Adjust fan belt to proper tension. (See page G-18.)
   - If the above two items are in normal condition, check refrigerant quantity. (See page 10-S20.)

**NOTE**

- If excessive refrigerant is to be discharged, loosen manifold gauge LO pressure side valve and vent out slowly.

(1) LO Pressure Side  (2) HI Pressure Side

**Air Entered in the Cycle**

a) Symptoms seen in refrigerating cycle
   - Both LO and HI pressure side (1), (2) pressures too high.
     - LO pressure side (1): 0.2 to 0.35 MPa
       (2.0 to 3.5 kgf/cm², 28 to 49.8 psi)
     - HI pressure side (2): 1.96 to 2.45 MPa
       (20 to 25 kgf/cm², 284.5 to 355.6 psi)

b) Probable cause
   - Air entered in refrigerating cycle.

c) Solution
   - Replace receiver.
   - Check compressor oil contamination and quantity.
   - Evacuate and recharge new refrigerant. (See page 10-S17, 18.)

**NOTE**

- The above cycle can be seen when the cycle is charged without evacuation.

(1) LO Pressure Side  (2) HI Pressure Side
Moisture Entered in the Cycle

a) Symptoms seen in refrigerating cycle
   • The air conditioner operates normally at the beginning, but over time, LO pressure side (1) pressure is vacuum and HI pressure side (2) is low pressure.
     LO pressure side (1) : Vacuum
     HI pressure side (2) : 0.69 to 0.98 MPa
                         (7 to 10 kgf/cm², 99.6 to 142.2 psi)

b) Probable cause
   • The moisture in the refrigerating cycle freezes in the expansion valve orifice and causes temporary blocking. After a time, the ice melts and condition returns to normal.

c) Solution
   • Replace receiver.
   • Remove moisture in cycle by means of repeated evacuation.
     (See page 10-S17.)
   • Recharge new refrigerant to the proper level. (See page 10-S18.)

Refrigerant Fails to Circulate

a) Symptoms seen in refrigerating cycle
   • LO pressure side (1) pressure is vacuum and, HI pressure side (2) is low pressure.
     LO pressure side (1) : Vacuum
     HI pressure side (2) : 0.49 to 0.59 MPa
                         (5 to 6 kgf/cm², 21.1 to 85.3 psi)
   • Frost or dew formed on piping at front and rear sides of expansion valve or receiver.

b) Probable cause
   • Refrigerant flow obstructed by moisture or dirt in the refrigerating cycle freezing or sticking on the expansion valve orifice.

c) Solution
   • Allow to stand for some time and then resume operation to decide whether the plugging is due to moisture or dirt.
   • If caused by moisture, correct by referring to instructions in previous.
   • If caused by dirt, remove the expansion valve and blow out the dirt with compressed air.
   • If unable to remove the dirt, replace the expansion valve.
     Replace the receiver. Evacuate and charge in proper amount of new refrigerant. (See page 10-S17, 18, 19.)
   • If caused by gas leakage in heat sensitizing tube, replace the expansion valve.

(1) LO Pressure Side  (2) HI Pressure Side
Expansion Valve Opens Too Far or Improper Installation of Heat Sensitizing Tube

a) Symptoms seen in refrigerating cycle
   • Both LO and HI pressure side (1), (2) pressures too high.
     LO pressure side (1) : 0.29 to 0.39 MPa
                            (3.0 to 4.0 kgf/cm², 42.7 to 56.9 psi)
     HI pressure side (2) : 1.96 to 2.45 MPa
                            (20 to 25 kgf/cm², 284.5 to 355.6 psi)
   • Frost or heavy dew on low pressure side piping.

b) Probable cause
   • Expansion valve trouble or heat sensitizing tube improperly installed.
   • Flow adjustment not properly done.

c) Solution
   • Check installed condition of heat sensitizing tube.
   • If installation of heat sensitizing tube is correct, replace the expansion valve.

Faulty Compression of Compressor

a) Symptoms seen in refrigerating cycle
   • LO pressure side (1) pressure too high :0.39 to 0.59 MPa (4 to 6 kgf/cm², 56.9 to 85.3 psi).
   • HI pressure side (2) pressure too low :0.69 to 0.98 MPa (7 to 10 kgf/cm², 99.6 to 142.2 psi).

b) Probable cause
   • Leak in compressor

c) Solution
   • Replace compressor. (See page 10-S30.)

■ NOTE
   • Manifold gauge indications (left side figure) at faulty compressing by compressor.

(1) LO Pressure Side (2) HI Pressure Side

[2] DISCHARGING, EVACUATING AND CHARGING

IMPORTANT
- When discharging, evacuating or charging the refrigerating system, be sure to observe the "PRECAUTION AT REPAIRING REFRIGERANT CYCLE". (See page 10-S7.)

(1) Discharging the System

Prepare for the R134a refrigerant recovery and recycling machine.
1. Connect low pressure side hose (blue) from the recovery and recycling machine to LO pressure side charging valve (2) on the compressor (3). Connect high pressure side hose (red) to HI pressure side charging valve (1) on the compressor (3).
2. Follow the manufacturers instructions and discharge the system.

IMPORTANT
- Use only R134a refrigerant recovery and recycling machine. Eliminate mixing R134a equipment, refrigerant, and refrigerant oils with R12 systems to prevent compressor damage.

CAUTION
- Protect fingers with cloth against frostbite by refrigerant when disconnecting the hose to the charging valve.

(2) Evacuating the System

12190S000310

12190P00420

12190F00690

10-S16
Evacuating the System

1. Discharge refrigerant from the system by R134a refrigerant recovery and recycling machine. (Refer to "Discharging the system").

2. Connect the charging hose (5) (red) to the HI pressure side charging valve and connect the charging hose (6) (blue) to the LO pressure side charging valve.

3. Connect the center charging hose (7) (green) to a vacuum pump inlet.

4. Open both valves (3), (4) of manifold gauge fully. Then run the vacuum pump (8) to evacuate the refrigerant cycle. (For approx. 15 minutes.)

5. When LO pressure gauge (1) reading is more than 750mmHg (299 in.Hg), stop the vacuum pump (8) and close both valves (3), (4) of manifold gauge fully.

6. Wait for over 5 minutes with the HI and LO pressure side valves (4), (3) of gauge manifold closed, and then check that gauge indicator does not return to 0.

7. If the gauge indicator is going to approach to 0, check whether there is a leaking point and repair if it is, and then evacuate it again.

(1) LO Pressure Gauge  (6) Blue Hose  
(2) HI Pressure Gauge  (7) Green Hose  
(3) LO Pressure Side Valve (Close)  (8) Vacuum Pump (Running)  
(4) HI Pressure Side Valve (Open)  (9) Compressor  
(5) Red Hose  (10) Vacuum Pump Adaptor
(3) Charging the System

Charging an Empty System (Liquid)

This procedure is for charging an empty system through the HI pressure side with the refrigerant in the liquid state.

⚠️ CAUTION

- Never run the engine when charging the system through the HI pressure side.
- Do not open the LO pressure valve when refrigerant R134a is being charged in the liquid state (refrigerant container is placed upside-down).

■ IMPORTANT

- After charging the refrigerant in the liquid state with approx. 500 g (1.1 lbs) through the HI pressure side, be sure to recharge the refrigerant in the vapor state to specified amount through the LO pressure side.
  1. Close the HI and LO pressure side valves (6), (5) of manifold gauge after the system is evacuated completely.
  2. Connect the center charging hose (4) to the can tap valve (7) fitting, and then loosen the center charging hose at the center fitting of manifold gauge until hiss can be heard. Allow the air to escape for few seconds and tighten the nut.
  3. Open the HI pressure side valve (6) fully, and keep the container upside-down to charge the refrigerant in the liquid state from the HI pressure side.
  4. Charge the refrigerant in the liquid state with approx. 500 g (1.1 lbs) from the HI pressure side.

■ NOTE

- If LO pressure gauge does not show a reading, the system is clogged and must be repaired.
  5. Close the HI pressure side valve (6) of manifold gauge and can tap valve of refrigerant container.
Charging an Empty or Partially Charged System (Vapor)

This procedure is to charge the system through the LO pressure side with refrigerant in the vapor state. When the refrigerant container is placed right side up, refrigerant will enter the system as a vapor.

⚠️ CAUTION

- Never open the HI pressure valve of manifold gauge while the engine is running.

⚠️ NOTE

- Do not turn the refrigerant container upside-down when charging the system by running the engine.
- Put refrigerant container into a pan of warm water (maximum temperature 40 °C (104 °F)) to keep the vapor pressure in the container slightly higher than vapor pressure in the system.

1. Check that the HI pressure valve (4) is closed.
2. Start the engine and set an approx. 1500 rpm.
3. Turn on the A/C switch.
   - Set the temperature control lever to maximum cooling position and the blower switch to HI position.
4. Open the LO pressure valve (3) of manifold gauge and the can tap valve (5) on refrigerant container and charge the refrigerant until air bubbles in the sight glass of the receiver vanish.
5. After charging the specified amount of refrigerant into the system, close the LO pressure valve (3) of manifold gauge and can tap valve (5), then stop the engine.
6. Check for gas leak with a electric gas leak tester (see page 10-S10).

(Reference)

- Specified amount of refrigerant (total) :
- 900 to 1000 g (2.0 to 2.2 lbs) [Refrigerant R134a]
- Manifold gauge indication at fully charged system (at ambient temperature : 30 °C (86 °F))
  
  **HI pressure side** :
  
<table>
<thead>
<tr>
<th></th>
<th>1.27 to 1.66 MPa</th>

</tr>
</tbody>
</table>

(1) LO Pressure Gauge  (4) HI Pressure Valve (Close)
(2) HI Pressure Gauge   (5) Can Tap Valve
(3) LO Pressure Valve (Open) (6) Compressor (Running)
(4) Checking Charge Refrigerant Amount

After charging the refrigerant, check for amount of charging refrigerant as follows.

**NOTE**
- The pressure on the following checking are the gauge indications at ambient temperature 30 °C (86 °F), so it should be noted that the pressure will differ some what with the ambient temperature.

1. Disconnect the 1P connector (6) of magnetic clutch.
2. Start the engine and set at approx. **1500 rpm**.
3. Connect the 1P connector (6) of magnetic clutch to battery directly, and then set the blower switch to HI position.
4. Leave the system for approx. **5 minutes** until the refrigerant cycle becomes stable, keeping pressure on the HI pressure side from 1.27 to 1.66 MPa (13 to 17 kgf/cm², 185 to 242 psi).
5. When the refrigerant cycle is stabilizer, turn off the blower switch and let the compressor alone to run. Then pressure on the LO pressure side gradually drops. At this time, if pressure on the HI pressure side is maintained from 1.27 to 1.66 MPa (13 to 17 kgf/cm², 185 to 242 psi), air bubbles which pass through the sight glass become as stated below depending on refrigerant charged amount.

**A: Insufficient refrigerant charge**
Air bubbles pass continuously the sight glass when pressure on the LO pressure side is over 99.0 kPa (1.01 kgf/cm², 14.4 psi). In this case, charge the refrigerant from the LO pressure side.

**B: Properly refrigerant charge**
Air bubbles pass through the sight glass continuously when pressure on the LO pressure side is within 59 to 98 kPa (0.6 to 1.0 kgf/cm², 9 to 14 psi).
If the charge refrigerant amount is proper, no air bubble is observed on the sight glass at pressure on the LO pressure side over 99.0 kPa (1.01 kgf/cm², 14.4 psi) when the blower switch is turned on. When the blower switch is turned off, bubbles pass through the sight glass in case pressure on the LO pressure side is within 59 to 98 kPa (0.6 to 1.0 kgf/cm², 9 to 14 psi).

**C: Excessive refrigerant charge**
Air bubbles pass through the sight glass time to time or no air bubble is observed when pressure on the LO pressure side is under 59 kPa (0.6 kgf/cm², 9 psi).
In this case, discharge excessive refrigerant gradually from the LO pressure side.

CHECKING, DISASSEMBLING AND SERVICING

[1] SEPARATING CABIN FROM TRACTOR BODY

DISASSEMBLING AND ASSEMBLING

The disassembling method described here is a procedure for disassembly that doesn't require discharging air conditioner refrigerant from the air conditioner system.
Draining Coolant

**CAUTION**

- Never remove the radiator cap until coolant temperature is well below its boiling point. Then loosen cap slightly to relieve any excess pressure before removing cap completely.

1. Stop the engine and let it cool down.
2. Remove the drain plug (1) or disconnect the hose to drain the coolant. When removing the drain plug, set the hose to drain port.
3. Remove the radiator cap to completely drain the coolant.
4. After all coolant is drained, reinstall the drain plug (1).

(1) Drain Plug

**Preparation 1**

1. Remove the side cover (1) from both sides and front mask (3).
2. Remove the front grille (4) and side skirt (5) both sides.
3. Disconnect the washer hose, then remove the bonnet (2).

(1) Side Cover      (4) Front Grille
(2) Bonnet          (5) Side Skirt
(3) Front Mask

**Preparation 2**

**CAUTION**

- When removing the battery cords from the battery, disconnect the negative first. When installing the battery cords to the battery, connect the positive cord first.

1. Remove the battery (1).
2. Remove the plate (2).
3. Remove the hose clamps (3).
4. Remove the hose stay (4).

(1) Battery      (3) Hose Clamp
(2) Plate        (4) Hose Stay
Compressor
1. Remove the muffler (4).
2. Disconnect the 1P connector (1) for magnetic clutch.
3. Remove the air conditioner belt (3) and remove the compressor (2) mounting screws.

(When reassembling)
- After reassembling the compressor, be sure to adjust the air conditioner belt tension. (See page 10-G2.)

12190S00430
**Preparation 4**
1. Remove the accelerator rod (4).
2. Disconnect the engine stop cable (2).
3. Disconnect the meter cable (1).
4. Remove the pillar support (5).
5. Remove the cord bands (7) and hose stay (6).
6. Disconnect the heater hoses (3), then pull out them under the cabin.
7. Disconnect the brake rod RH (8).

**(When reassembling)**
- In assembling the heater hoses (2) to the water valve (5), connect the heater hose with identification mark (white paint) to upper side of the water valve (5).
- After reassembling the brake rod, be sure to adjust the brake pedal free travel. (See page 5-S3.)

| (1) Meter Cable | (5) Pillar Support |
| (2) Engine Stop Cable | (6) Hose Stay |
| (3) Heater Hoses | (7) Cord Band |
| (4) Accelerator Rod | (8) Brake Rod, RH |

**Preparation 5**
1. Disconnect the 2P connector and jumper lead for alternator (1) and the jumper leads (4) for fuel level sensor, starter (2) connectors and engine oil switch (5) terminal, then remove the cord band (3).
2. Disconnect the brake rod LH (6).

**(When reassembling)**
- After reassembling the brake rod, be sure to adjust the brake pedal free travel. (See page 5-S3.)

| (1) Alternator | (4) Fuel Level Sensor Lead |
| (2) Starter | (5) Engine Oil Switch |
| (3) Cord Band | (6) Brake Rod, LH |

**Connectors**
1. Remove the rubber cover (2).
2. Pull out the wire harness (3) so that it can be seen.
3. Disconnect the three connectors (1) (white connectors).

| (1) Connectors | (3) Wire Harness |
| (2) Rubber Cover |
**Preparation 6**

1. Remove the steering post covers (1) and steering post under cover (2).
2. After tilting the steering wheel up, loosen and remove the meter panel (3) mounting screws, then lift the meter panel (3) up.
3. Disconnect the clutch rod (6) from both sides and remove it.

*(When reassembling)*

- After reassembling the clutch rod, be sure to adjust the clutch pedal free travel. (See page 2-S3.)

1. Remove the extension shaft (1) of lowering speed adjusting valve.
2. Disconnect the differential lock rod (2).

   (1) Extension Shaft
   (2) Differential Lock Rod
Preparation 10
1. Remove the quick coupler assembly (if equipped).
2. Disconnect the rear combination lamp (1) jumper leads (2) both sides.

(1) Rear Combination Lamp
(2) Jumper Leads

Dismounting Cabin
1. Remove the outer roof of cabin.
2. Support the cabin with nylon lift straps (10) and hoists.
3. Loosen and remove the cabin mounting screws (1) and nuts (8).
4. Dismounting the cabin from tractor body.

NOTE
- When lifting the cabin with the hoist, be sure not to drop the cabin mounting rubber, plate and washers.
- Set the front wheel drive shift lever to the 4WD position, and lift the cabin while making sure it doesn’t catch on anything (4WD type only).
- Lift up and down the cabin with the hoist, pulling the front wheel drive shift lever backward by hand to prevent it interrupting with the cabin.

(When reassembling)
- Install the same washers as they were.

[2] COMPRESSOR CHECKING

Operation of Magnetic Clutch
1. Start the engine.
2. Check whether abrasion or abnormal noise is heard when only the magnetic clutch pulley is running while the A/C switch is turned **OFF**.
3. Check that the magnetic clutch (1) does not slip when the A/C switch and blower switch are turned **ON** (when the air conditioner is in operation).
4. If anything abnormal is found, repair or replace.

(1) Magnetic Clutch
Stator Coil
1. Measure the resistance of the stator coil with an ohmmeter across the 1P connector of magnetic clutch and stator body.
2. If the measurement is not within the factory specifications, replace the stator coil.

DISASSEMBLING AND ASSEMBLING

Preparation
1. Remove the side cover (1) both sides and front mask (3).
2. Disconnect the washer hose, then remove the bonnet (2).
3. Disconnect the battery negative cord.

(1) Side Cover          (4) Front Grille
(2) Bonnet              (5) Side Skirt
(3) Front Mask
Compressor

1. Discharge the refrigerant from the system. (Refer to "Discharging the System": See page 10-S16.)
2. Disconnect the low pressure pipe (suction) (3) and high pressure pipe (discharge) (2) from the compressor, then cap the open fittings immediately to keep moisture out of the system.
3. Disconnect the 1P connector (1) of magnetic clutch.
4. Remove the air conditioner belt (4) and remove the compressor (5).

(When reassembling)
- After reassembling the compressor, be sure to adjust the air conditioner belt tension (see page 10-G2) and recharge the refrigerant to the system. (Refer to "Charging the System": See page 10-S18.)
- Apply compressor oil (NIPPONDENSO ND-OIL8 or equivalent) to the O-rings and take care not to damage them.
- "S" letter is marked on the compressor for connecting the low pressure pipe (suction side).
- "D" letter is marked on the compressor for connecting the high pressure pipe (discharge side).

(When replacing compressor)
- When replacing the compressor with a new one, meet the oil amount with old one.

[3] AIR CONDITIONER SYSTEM AND FRONT WINDSHIELD WIPER CHECKING

(1) Air Conditioner Unit

A/C Relay

1. Remove the outer roof of cabin, and disconnect the A/C relay (1), (2), (3), (4) connectors.
2. Perform the following checkings 1) and 2).

(1) A/C Relay (Blower HI)  (3) A/C Relay (Blower ME)  
(2) A/C Relay (Blower LO)  (4) A/C Relay (Compressor)
1) Connector Voltage

a) A/C Relay (Blower HI)
1. When turning the main switch ON and blower switch to HI position, the voltage across the 2 terminal and chassis should be approx. battery voltage.

b) A/C Relay (Blower LO)
1. The voltage across the 4 terminal and chassis should be approx. battery voltage.
2. When turning the main switch ON and blower switch to LO position, the voltage across the 2 terminal and chassis should be approx. battery voltage.

c) A/C Relay (Blower ME)
1. When turning the main switch ON and blower switch to ME position, the voltage across the 2 terminal and chassis should be approx. battery voltage.

d) A/C Relay (Compressor)
1. The voltage across the 4 terminal and chassis should be approx. battery voltage.
2. When turning the main switch ON, blower switch to LO and A/C switch ON, the voltage across the terminal 2 and chassis should be approx. battery voltage.

2) A/C Relay Test
1. Remove the A/C relay (1).
2. Connect the battery (2) and bulb (3) with the A/C relay (1) as shown in the left figure.
3. In this condition, the bulb should light on if the A/C relay is proper.
4. If the bulb light off when disconnecting the jumper lead (4) from the A/C relay 4 terminal, the A/C relay is proper.

A/C Blower Switch
1. Remove the outer roof and disconnect the A/C blower switch connector (1).
2. Perform the following checkings 1) and 2).

A/C Blower Switch Connector

1) Connector Voltage
1. Turn the main switch ON.
2. Measure the voltage with a voltmeter across the connector L terminal and A terminal.
3. If the voltage differs from the battery voltage, the wiring harness, A/C relay, fuse or main switch is faulty.

<table>
<thead>
<tr>

A/C Blower Motor Test
1. Remove the outer roof.
2. Turn the blower motor (1) by hand and check whether it turns smoothly.
3. Disconnect the connector (2) of blower motor (1).
4. Connect a jumper lead from battery (3) positive terminal to connector B terminal.
5. Connect a jumper lead from battery negative terminal to connector E terminal momentarily.
6. If the blower motor does not run, check the motor.

(1) Blower Motor  (3) Battery (12 V)
(2) Blower Motor Connector

A/C Blower Resistor
1. Remove the outer roof.
2. Disconnect the 4P connector (2) for A/C blower resistor (1).
3. Measure the resistance with an ohmmeter across the R1 terminal and E terminal, and across the R2 terminal and E terminal.
4. If the factory specifications are not indicated, A/C blower resistor is faulty.

<table>

</table>

*1: Push the A/C switch button to ON position.
*2: Push again the A/C switch button to OFF position.
Pressure Switch

1) HI Pressure Side
1. Connect the manifold gauge (3) to compressor as following procedure.

Close the HI and LO pressure valves (5), (4) of manifold gauge tightly, and connect the charging hoses (red and blue) (6), (7) to the respective compressor service valves. (Refer to HANDLING OF SERVICE TOOLS : See page 10-58.)

■ NOTE
• Be sure to drive out the air in the charging hoses at the manifold gauge connection end by utilizing the refrigerant pressure in the refrigerant cycle.

2. Start the engine and set at approx. 1500 rpm. Turn on the A/C switch, then set the blower switch to HI position.
3. Raise pressure on the HI pressure side of the refrigerant cycle by covering the condenser front with a corrugated cardboard, and the dual switch (8) is activated and the compressor magnetic clutch is turned off. At this time, read the HI pressure gauge of the manifold gauge. If this pressure reading differs largely with the setting pressure, replace the pressure switch with a new one.

<table>
<thead>
<tr>
<th>Setting pressure</th>
<th>Factory spec.</th>
<th>Dual switch</th>

12190S00790
10-S36
Air Mixing Door Control Cable (Blue Cable)
1. Disconnect the air mixing door control cable (3) from the damper lever (1) of air conditioner control panel side.

(When reassembling)
- Set the damper lever (1) of the air conditioner unit at MAX HOT position. Reconnect the cable.
- Move the control to MAX HOT position. Fit the inner cable in position, and press and fix the outer cable by the cable clip (2) in the direction of arrow (A) as shown at left.
- Move the temperature control lever several times and finally set it to MAX HOT position to make sure the damper lever is at HOT position too.

1. Damper Lever  (a) 5 to 10 mm (0.20 to 0.40 in.)
2. Cable Clip
3. Air Mixing Door Control Cable  (A) Direction of Pulling Outer Cable

A/C Mode Door Control Cable (Yellow Cable)
1. Disconnect the air conditioner mode door control cable (3) from the def. control lever (1) of A/C control panel side.

(When reassembling)
- Set the air conditioner unit to DEF mode position and reconnect the cable (3).
- Set the control at DEF position. Fit the inner cable in position, and press and fix the outer cable by the cable clip (2) in the direction of arrow (B) as shown at left.
- Move the mode lever several times and finally set it to DEF position to make sure the air conditioner unit is at DEF mode position.
- Lay and fix the mode door control cable over the water valve cable.

1. DEF. Control Lever  (a) 5 to 10 mm (0.20 to 0.40 in.)
2. Cable Clip
3. Mode Door Control Cable  (B) Direction of Pushing Outer Cable

Water Valve Control Cable (White Cable)
1. When disconnecting the water valve cable (2), follow the next reassembly procedure.

(When reassembling)
- Fully close the water valve (1) and reconnect the cable (2).
- Set the control at MAX COOL position. Fit the inner cable in position, and press and fix the outer cable by the cable clip (3) in the direction of arrow (A) as shown at left.
- Move the temperature control lever several times to make sure the water valve is fully closed at MAX COOL position.
- Do not allow the water valve cable to bend just away from the control, nor to get caught by the outer roof.

1. Water Valve  (a) 5 to 10 mm (0.20 to 0.40 in.)
2. Water Valve Control Cable  (B) Direction of Pushing Outer Cable
3. Cable Clip
Air Conditioning Unit
1. Remove the unit cover (1).
2. Disconnect the heater hoses (8).
3. Disconnect the cooler pipe (liquid) (2) and coolerpipe (suction side) (3).
4. Remove the five screws (7) and take off the unit.
5. Remove the duct hoses.

(When reassembling)
- When reconnecting the cooler pipes with the unit, apply compressor oil (NIPPON-DENSO-OIL8 or equivalent) to O-rings.
- When remounting the unit, tighten five screw by hand and finally retighten them after aligning the inner roof duct with the unit duct.

| Tightening torque | A/C unit mounting screw (M6) | 3.92 to 6.86 N-m  
|                  |                              | 0.40 to 0.70 kgf-m

3. Pull out the heater hoses (1) from the bottom of the cabin.
4. Take out the heater hoses (1).

**When reassembling**
- In assembling the heater hose (1) to the pipe (2), connect the heater hose with identification mark (white paint) to upper side of the hose pipe.
- When connecting the heater hose with A/C unit, hose should be put into the A/C unit pipe more than 30 mm (1.2 in.).
SERVICING

(1) Air Conditioner Unit

Evaporator
1. Check whether white powder or dust is attached to the evaporator (1). If they are attached, wash them off with warm water and blow them off with compressed air.

NOTE
• In case the evaporator is cleaned with warm water, cap the evaporator pipe ends so that water does not enter it.

(1) Evaporator

[4] LIGHTING SYSTEM
CHECKING

(1) Working Light

Working Light Switch
1. Remove the outer roof, and disconnect the working light switch connector (1) from the switch (2) connector.
2. Perform the following checkings 1) and 2).

(1) Working Light Switch Connector
(2) Working Light Switch

1) Connector Voltage
1. Turn the main switch ON.
2. Measure the voltage with a voltmeter across the connector 1 terminal and chassis.
3. If the voltage differs from the battery voltage, the wiring harness, fuse or main switch is faulty.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>1 terminal – Chassis</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
</table>

2) Working Light Switch
1. Check the continuity through the switch with an ohmmeter.
2. If continuity specified below is not indicated.

<table>
<thead>
<tr>
<th>Position</th>
<th>Terminal</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Working light switch</td>

<td>●</td>
</tr>
</tbody>
</table>

(1) Working Light Switch
(2) Working Light Switch Connector (Switch Side)
(3) Working Light Switch Connector (Wiring Harness Side)
(2) Hazard and Turn Signal Light

**Hazard and Turn Signal Relays**

1. Remove the panel under cover, and disconnect the relays (1), (2) and (3) connectors.
2. Perform the following checkings 1) and 2).

<table>
<thead>
<tr>
<th>(1) Hazard Relay</th>
<th>(4) Hazard Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2) Turn Signal Relay (LH)</td>
<td>(5) Starter Relay</td>
</tr>
<tr>
<td>(3) Turn Signal Relay (RH)</td>
<td>(6) Glow Relay</td>
</tr>
</tbody>
</table>

1) **Connector Voltage**

1. Turn the main switch ON.
2. Measure the voltage with a voltmeter across the connector 1 terminal and chassis.
3. If the voltage differs from the battery voltage, the wiring harness, fuse or main switch is faulty.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>1 terminal – Chassis</th>
<th>Approx; battery voltage</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a) From Main Switch AC Terminal</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2) **Relay Test**

1. Remove the relays.
2. Connect jumper leads across the 1 terminal of connector and COIL terminal of relay, and across the 1 terminal of connector and NO terminal of relay.
3. Connect jumper leads across the COIL terminal of relay and chassis, and across the COM terminal of relay and bulb terminal.
4. Connect jumper leads across the bulb terminal and chassis, then main switch ON and light up the bulb.
5. If the bulb lights off when disconnecting the jumper lead (A) from the COIL terminal of relay, the relay is proper.

(1) Relay
Hazard Switch
1. Remove the meter panel and remove the hazard switch (1).
2. Check the continuity through the switch with an ohmmeter.
3. If the continuity specified below is not indicated, the switch is faulty.

<table>

[5] OTHERS
DISASSEMBLING AND ASSEMBLING
(1) Cab Windshields

Preparation
1. Prepare the followings.
1.1) Tools
- Cutter knife 1 pcs
- Scraper 1 pcs
- Gun for coating 1 pcs
- L shaped cutter 1 pcs
- Spoon for correction 1 pcs
- Sun grip (Suction rubber cup) 1 pcs
- Masking tape

1.2)  
- *1 Primer 35 and 47 or equivalent
- *1 Bond U90 or equivalent
- *2 PANDO524A Silicon or equivalent

NOTE
- *1 is made by Sunrise MSI, Ltd.
- *2 is made by Pando, Ltd.
- These materials (*1 and *2 Primer, Bond, Silicon) can't be provided by Kubota Corporation.
- Specially, Primer can't be stocked in a distributor for more than 60 days. Because it may set if a distributor keeps in stock for more than 60 days.
- Therefore, please find the local made equivalent materials in your country and use them when you need.
Before Replacing Windshields (1)

[In case of using piano wire (When glass is clacked)]
1. Thread the piano wire from the inside of cabin. Tie its both ends to a wooden blocks or the like. (See the left figure.)
2. Pull the piano wire inward/outward alternately to cut the adhered part.

**NOTE**
- Do not let the piano wire make sliding contact with the edge of glass plate forcibly.

[In case of using cutter knife (When glass is totally crushed finely)]
1. Insert the knife (3) into the adhered part.
2. Keep the edge of knife blade square to the glass edge at the part (a). Slide the knife blade along the glass surface and the edge. Pull the part (b) in the direction parallel to the glass edge to cut them off.

**NOTE**
- Find a wider gap between the glass and body.
- Take care of handling the cutter knife not to damage your hand.

---

(1) Piano Wire  (3) Cutter Knife
(2) Wood Peace  (4) Pulling

Before Replacing Windshields (2)

1. When the bond U90 or equivalent attached to the cabin frame and the glass are reused, remove the bond clearly.
2. Clean the frame surface with ethyl acetate (or white gasoline, alcohol).
3. When the coating fell off vividly at the step 1 above, apply the primer 35 or equivalent to the cabin frame so that the bond can be applied evenly (resulting in better adhesion of U90).

**NOTE**
- Remove the bond completely.
- When the coating has fallen off, never use spray coating (or it may result in adhesive failure).
- The ethyl acetate is dangerous when it touches your eye(s). Attach a waste to its bottle opening to make ethyl acetate to penetrate it.
Before Replacing Windshields (3)

1. Check that the glasses are not damaged and cracked.
2. Turn over the glass and clean this rear surface of the glass by the waste which makes ethyl acetate and etc. to penetrate. This cleaning area of the rear surface is indicated “A” in the left figure.

**NOTE**
- Checking method of face and rear surface of glass is as follows.
  a) In the face surface side of upper windshield (1), the letters are indicated at the right upper side of it.
  b) Right lower windshield (3) is the same as left lower windshield (2).

  From the view of out side, the normal letters are indicated in the left lower windshield (2), but the reverse letters are indicated in the right lower front glass (3).
- If no cleaning the glass, it may result in adhesive failure.
- Take care of handling the ethyl acetate not to touch your eyes and etc. Attach a waste to its bottle opening to make ethyl acetate to penetrate it.

(1) Upper Windshield
(2) Lower Windshield (Left)
(3) Lower Windshield (Right)

Windshields Label

1. Attach a label (4) on the new windshield (3) (T0270-70570).

**NOTE**
- Remove the parts which may disturb your work, such as an outer roof, working lamp, and wiper before the work.

(1) Cabin Frame
(2) Shield Dam
(3) Upper Windshield
(4) Label
(5) Lower Windshield (Right)
(6) Lower Windshield (Left)
(7) Windshield Stay

Masking

1. Attach a masking tape (2) (for a primer) 20 mm (0.8 in.) from the glass edge (4) (press it firmly to fix).

(1) Windshield
(2) Masking Tape
(3) Primer
(4) Glass Edge

a-a: Cut Section
b: Face Surface
c: Rear Surface
A: 20 mm (0.8 in.)
Coating with Primer
1. Coat the new glass with a primer (6) or equivalent (* on the rear surface and three sides of glass).
2. Apply a primer on the edge of glass (with a sponge or brush), too.

■ NOTE
- Rectify the primer coat if there appear deformation (curve) and stripes (unevenness) as shown in the left figure.

(1) Upper Windshield
(2) Masking Tape
(3) Lower Windshield (Right)
(4) Label
(5) Lower Windshield (Left)
(6) Primer

a-a : Cross Section
b : Face Surface
c : Rear Surface
d : Correct Coating
e : Incorrect (Curve)
f : Incorrect (Unevenness)
A : 20 mm (0.8 in.)

Attaching Dam
1. Attach a dam (2) (34070-99451 shield a’ssy dam) on the glasses (upper and lower windshield) (1), (3), (5).

■ NOTE
- Attach the dam 10 mm (0.4 in.) from the inside edge of primer applied surface as shown in the left figure.
- Attach the dam in place referring to the left figure.
2. Apply the bond U90 (7), or equivalent along the dam of glass (bonding).

■ NOTE
- Apply the bond U90 with the jig having the specified tip shape along the dam attached parts as shown in the left lower figure.
- Apply it with a uniform speed to minimize unevenness.
Cabin Body Side

1. Attach the dam (3) on the cabin body (1) side as shown in the left figure.

**NOTE**
- Attach the dam on the panel frame unit as shown in the left figure.
- Attach the dam of equal length, 70 to 80 mm (2.8 to 3.1 in.) on both sides as shown in the left figure.

2. Apply the bond U90 or equivalent along the dam on the cabin body side as shown in the left figure.

**NOTE**
- Apply the bond U90 along the dam with the jig (4) having the specified tip shape for the U90.
- Apply the bond with a uniform speed to minimize unevenness.

(1) Cabin Body
(2) Bond
(3) Dam
(4) Jig (The Specified Tip Shape for the Bond U90)

C : 70 to 80 mm (2.8 to 3.1 in.)
D : 2 to 3 mm (0.08 to 0.12 in.)
E : Dia. 5 mm (0.2 in.)
F : 10 mm (0.39 in.)
Installing Windshield

1. Install the lower (left or right) windshield (5), (4) to the cabin with a sun grip (suction rubber cup) and fix it with a gummed tape. Leave it for five hours.

**NOTE**
- Use a jig A (7) shown in the left figure to create even clearance (5 mm (0.2 in.) approx.) between the lower windshield and cabin frame.
- When the glass is set to the cabin frame with the fixing jig A (7), confirm that the whole clearance is even. When the glass is fixed, it is concaved 5 mm (0.2 in.) approx. from the frame.

2. Set the upper windshield (3) to the cabin with the sun grip and fix it with a gummed tape.

**NOTE**
- Use a jig B (8) shown in the left figure to create even clearance (3 mm (0.12 in.) approx.) between the upper and lower windshield.
- When the glass is set with the fixing jig, confirm that the whole clearance is even. After the glass is fixed, it is concave 5 mm (0.2 in.) approx. from the frame.
- The level unevenness between the upper and lower windshields should be ±1 mm (±0.04 in.) or less at the glass surface.
- The ethyl acetate is dangerous when it touches your eye(s). Attach a waste to its bottle opening to make ethyl acetate to penetrate it.

Installing Windshield (Continued)

4. Apply the bond U90 or equivalent to P part, PAN00524A silicon to Q part as shown in the left figure. Then rectify them with a spoon jig (P part) and a thin plate (Q part).

**NOTE**
- The part A shown in the left figure should be finished smoothly without any hollows of bond U90.
- The finishing procedure of Q part silicon.
- Inject silicon to the both edges of the glass center (top point).
- Attach a thin resin plate to the Q part from the inside of cabinet and inject silicon from the outside.
- Use a thin resin plate to finish the outside surface and the inside surface in this order as shown in the left figure.
  - Spread silicon equally.
  - Do not mix air into silicon.
  - Do not adhere silicon on the glass surface.
  - Apply the primer 47 or equivalent to the bond U90 part for a better adhesive strength.
  - The clearance between the front frame and the lower glass should be even on the right and left sides. The glass should not be tilted.
5. When the bond and silicon are dried well, remove the fixing gummed tape.

**NOTE**
- When the gummed tape is removed, the glass may be displaced. In this case fix it again.
- Remove the gummed tape little by little to confirm the bonding condition.
6. Check all the parts again.

MECHANISM

CONTENTS

[1] POWER TRANSMISSION ................................................................. M-M1
[2] LIFTING MECHANISM ................................................................. M-M2
[1] POWER TRANSMISSION

When the PTO shift lever and mid PTO lever are shifted to "ENGAGE" positions, the power is transmitted from mid PTO to blades (8) as follows:

Mid PTO → Universal Joint (7) → Pinion Shaft (4) → 20T Bevel Gear (3) → 17T Bevel Gear (1) → Spindle Shaft (2) → (Pulley 1 (9) → V-belt (10) → Pulley 2 (11) → Cutter Shaft (12)) → Blades (8).

(Reference)
- Keep the engine running at full throttle for best results.
The lifting of mower is performed by the hydraulic system installed on the tractor.

For avoiding danger, the mower should be kept lifting when traveling. When the hydraulic position control lever is moved to the LIFT position, the lower link (10) is risen by the oil pressure of hydraulic system, and lift chain (6) is pulled by the connecting rod (8) and lift link (5).

Therefore, the mower is lifted.

As the upper link system is a pantographic linkage, the mower can be kept parallel at every position.

⚠️ CAUTION

- Never operate mower in transport position.

GENERAL

[1] MOWER IDENTIFICATION

When contacting KUBOTA, always specify mower serial number.

(1) Mower Serial Number

[2] GENERAL PRECAUTION

- During disassembly, carefully arrange removed parts in a clean area to prevent confusion later. Screws, bolts and nuts should be installed in their original position to prevent reassembly errors.
- When special tools are required, use KUBOTA genuine special tools. Special tools which are not frequently used should be made according to the drawings provided.
- Use KUBOTA genuine parts or KUBOTA-recommended parts and lubricants or their equivalents.
- Gaskets and O-rings must be replaced during reassembly.
- Apply grease to new O-rings or oil seals before assembling. See the figure.
- When reassembling external snap rings or internal snap rings. They must be positioned so that sharp edge faces against the direction from which a force is applied. See the figure.
- Use only metric tools when servicing this machine. Metric screws, bolts and nuts are not interchangeable with nonmetric fasteners.
- Remove oil and dirt from parts before measuring.

</table>

[6] CHECK AND MAINTENANCE

Checking Oil Level in Gear Box
1. Place the mower on level ground and loosen the check plug (1).
2. Check to see if oil seep from the opening.
3. If the oil level is below, add sufficient SAE 90 gear oil.

<table>
<thead>
<tr>
<th>Capacity</th>
<th>Gear box oil</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.75 $</td>
<td>0.79 U.S.qts.</td>

<td></td>
</tr>
</tbody>
</table>

(1) Check Plug   (2) Drain Plug

Changing Oil in Gear Box
1. Place the mower on level ground.
2. Remove the check plug (1) and drain plug (2), and then drain the oil.
3. Reinstall the drain plug (2), and then fill oil up to the specified level.
4. Reinstall the check plug (1).

<table>
<thead>
<tr>

MOUNTING AND DISMOUNTING MOWER

**CAUTION**

- When dismounting the mower, park the tractor on flat ground, apply the parking brake, and stop the engine.

### Lift Chain

1. Remove the lift chains (1) from the lift link (2).

(When mounting)

- Be sure not to twist the lift chains (1).

![Diagram showing lift chain and lift link](image)

(1) Lift Chain       (2) Lift Link

### Upper Links and Link 1

1. Remove the upper links (3) from the hanger brackets.

(When mounting)

- Install the upper link, noting its direction.

![Diagram showing upper links and link 1](image)

(1) Hanger Bracket       (3) Upper Link
(2) Clevis Pin (A) (Ø14 x 75)       (4) Clevis Pin (B) (Ø14 x 90)

### Link 1

**[HST Model]**

1. Remove the clevis pin (1) and disconnect the link 1 (8) from the link 2 (9).

**[Manual Transmission and GST Model]**

1. Remove the clevis pin (6) and disconnect the link 1 (8) from the hanger bracket (10).

(When mounting)

- Install the upper link 1, noting its direction.

![Diagram showing link 1](image)

(1) Clevis Pin       (6) Clevis Pin
(2) Plain Washer       (7) Snap Ring
(3) Snap Ring       (8) Link 1
(4) Mower Deck       (9) Link 2
(5) Plain Washer       (10) Hanger Bracket

A : Front       B : Rear
Universal Joint
1. Pull back the coupler (1) of the universal joint (2), and then remove it from mid PTO shaft.

(When mounting)
- Pull back the coupler (1) of the universal joint (2).
- Push the universal joint (2) onto the mid PTO shaft until the coupler locks.
- Slide the universal joint (2) back and forward to make sure the universal joint (2) is locked securely.

- IMPORTANT
  - Finally pull the universal joint to see if it is tight in position.

(1) Coupler  (2) Universal Joint

Taking Out Mower
1. Turn the front wheels to the left.
2. Take out the mower to the right side of the tractor.

- NOTE
  - To take out the mower easily, remove only the left front gauge wheel and attach the both rear anti-scalp rollers (1) as shown in the photograph.

(1) Rear Anti-scalp Roller

CHECKING, DISASSEMBLING AND SERVICING
CHECKING AND ADJUSTING

Checking Blade
1. Check the cutting edge of blade.
2. Sharpen the cutting edges, if the blades are as shown in figure (A). Replace the blades, if they are as shown in figure (B). (Refer to “DISASSEMBLING AND ASSEMBLING”.)

- NOTE
  - To sharpen the blades by yourself, clamp the blade securely in a vise and use a large mill file along the original bevel. File to a sharp edge.
  - To balance the blade, place a small rod through the center hole and check to see if the blade balances evenly. File heavy side of the blade until it balances out even.
Adjusting Belt Tension
1. Dismount the mower from the tractor, and remove the right and left shields from the mower deck.
2. Measure the length (L) of the tension spring.
3. If the measurement is not within the factory specifications, adjust the length with the tension screw.

<table>
<thead>
<tr>
<th>Spring length</th>
<th>Factory spec.</th>
<th>164 to 166 mm</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>6.45 to 6.53 in.</td>
</tr>
</tbody>
</table>

**NOTE**
- After adjustment, secure the tension screw with the lock nut.

Checking Belt
1. Check to see the belt.
2. Replace the belt with a new one, if there is found surface split at more than 3 positions.

(When replacing belt)
1. Remove the right and left shields.
2. Loosen the tension screw.
3. Remove the right hand bracket (1) which mounts the gear box to the deck.
4. Remove the belt.
- To install a new belt, reverse the above procedures.

**IMPORTANT**
- Before removing the right hand bracket (1), loosen the tension screw.
- After replacing the belt, be sure to adjust the belt tension.

(1) Right Hand Bracket

---

Adjusting Connecting Rod
1. Raise the tractor lower links at the maximum lifting position.
2. Adjust the length of both connecting rods with the turnbuckles until the front stop bolts (2) heads just contact the upper links (1) at the maximum lifting position of the mower.

**IMPORTANT**
- Proper adjustment of the connecting rod length is very important to avoid damage to the lift frame.
- Do not change the length (L) of the stop bolts.

DISASSEMBLING AND ASSEMBLING

**Shield**
1. Remove the right and left pantograph linkage.
2. Remove the right and left shields.

*(When reassembling)*
- Spread the cotter pin completely.

**Blade**
1. Turn over the mower.
2. Loosen the blade screw (5).
3. Remove the blade screw (5), friction washer (4), two cup washers (3) and blade (2).

**NOTE**
- To remove the blade (2) securely, wedge a block of wood between one blade (2) and the housing in such position that it will hold the blade (2) safely while loosening or tightening the blade screw (5).

*(When reassembling)*
- Be sure to assemble the friction washer (4) and two cup washers (3) between the blade (2) and blade screw (5).

**IMPORTANT**
- Make sure the two cup washers are not flattened out or worn, causing blade to slip easily. Replace two cup washers and friction washer if either is damaged.

<table>

</table>

**Blade Boss**
1. Remove the external snap ring (2).
2. Remove the blade boss (1).

(1) Blade Boss (2) External Snap Ring
**Gear Box**

1. Loosen the tension screws (1) and remove the V-belt (4).
2. Remove the gear box bracket (2).
3. Pull out the gear box (5) upward.
4. Loosen the drain plug.
5. Drain out gear oil.

**IMPORTANT**
- Before removing the belt, loosen the tension screw.

**(When reassembling)**
- After reassembling the V-belt, be sure to adjust the belt tension. (See page M-58.)

<table>

Pinion Shaft
1. Remove the 20T bevel gear (1) and shims (2), (3).
2. Remove the oil seal (8) and internal snap ring (7).
3. Tap out the pinion shaft (5).

(When reassembling)
- Check the backlash, tooth contact and turning torque. If not proper, adjust with the shims (2), (3). (Refer to SERVICING.)

(1) 20T Bevel Gear  (2) Shim  (3) Shim  (4) Ball Bearing  (5) Pinion Shaft  (6) Ball Bearing  (7) Internal Snap Ring  (8) Oil Seal

SERVICING

Backlash between Bevel Gears
1. Remove the gear box cap.
2. Place fuses on the 20T bevel gear (2).
3. Assemble the gear box cap, and turn the pinion shaft (1).
4. Remove the gear box cap again, and take out the fuses.
5. Measure the thickness of fuses with an outside micrometer. (Backlash equal thickness of fuse.)
6. If the backlash is not within the factory specifications, adjust with shims (3), (6).

<table>
<thead>
<tr>
<th>Backlash between bevel gears</th>
<th>Factory spec.</th>
<th>0.13 to 0.25 mm</th>
<th>0.0051 to 0.0098 in.</th>

## Engine

- **Model**: V2203-EHA
- **Type**: Indirect injection, vertical, water-cooled, 4-cycle diesel engine
- **Number of cylinders**: 4
- **Bore and stroke**: 87 x 92.4 mm (3.4 x 3.6 in.)
- **Total displacement**: 2197 cm³ (134.1 cu.in.)
- **Rated revolution**: 45.0 r/s (2700 rpm)
- **Combustion chamber**: Spherical type (E-TVCS)
- **Fuel injection pump**: Bosch type mini pump (PFR4M)
- **Governor**: Centrifugal ball mechanical governor
- **Injection nozzle**: Throttle type
- **Injection timing**: Before T.D.C. 0.314 rad. (18°)
- **Injection order**: 1-3-4-2
- **Injection pressure**: 13.73 MPa (140 kgf/cm², 1991 psi)
- **Compression ratio**: 23 : 1
- **Lubricating system**: Forced lubrication by trochoidal pump
- **Cooling system**: Pressurized radiator, Forced circulation with water pump
- **Starting system**: Electric starting with cell starter 12 V, 1.4 kW
- **Alternator**: 12 V, 480 W (40 AMPs)
- **Battery**: 12V, RC : 137 min, CCA : 447-Cold cranking Amps at –18 °C (~ 0.4 °C)
- **Fuel**: Diesel fuel No.1 [below –10 °C (14 °F)] Diesel fuel No.2 [above –10 °C (14°F)]
- **Lubricating oil**: CC or CD (API grade)
- **Weight (Dry)**: 206.5 kg (455 lbs)

## Capacities

- **Fuel tank**: 35.0 L (9.2 U.S.gal., 7.7 Imp.gal.)
- **Engine crankcase**: 7.6 L (8.0 U.S.qts., 6.7 Imp.qts.)
- **Engine coolant**: 7.5 L (7.9 U.S.gal.s, 7.0 Imp.qts.)
- **Transmission case**: 39.0 L (10.3 U.S.gal., 8.6 Imp.gal.)
- **Front axle case**: 7.5 L (7.9 U.S.qts., 6.6 Imp.qts.)

## Dimensions (with Std. tires)

- **Overall length (without 3P)**: 3020 mm (118.9 in.)
- **Overall length (with 3P)**: 3230 mm (127.2 in.)
- **Overall width (Minimum tread)**: 1585 mm (62.4 in.)
- **Overall height**
  - Top of ROPS: 2155 mm (84.8 in.)
  - Top of CABINE: 2175 mm (85.6 in.)
- **Overall height (Top of steering wheel)**: 1535 mm (60.4 in.)
- **Wheel base**: 1815 mm (71.5 in.)
- **Minimum ground clearance**
  - (Under transmission): 380 mm (15.0 in.)
- **Tread**
  - Front [mm (in.)]: 1290 (50.8)
  - Rear [mm (in.)]: 1180 (46.5), 1200 (47.2), 1300 (51.2), 1450 (57.1), 1545 (60.8)

[2] CHECK AND MAINTENANCE

Only the maintenance item added by L4610 is described in this section. Please refer to the section of GENEREL for other maintenance items.

(1) Check Points of Every 50 Hours

Greasing

1. Apply grease to the Front wheel case support. (RH, LH)
2. Grease fitting (Front wheel case support) [RH, LH]
(2) Check Points of Every 200 Hours

Adjusting Toe-in
1. Park the tractor on the flat place.
2. Inflate the tires to the specified pressure.
3. Turn the front wheels straight ahead.
4. Measure the distance between the centers of front wheels at front and rear.
5. If the measurement is not within the factory specifications, adjust by changing the tie-rod length.

<table>
<thead>
<tr>
<th>Toe-in (A-B)</th>

</tr>
</tbody>
</table>

(3) Check Points of Every 400 Hours

Changing Front Axle Case Oil
1. To drain the used oil, remove the right and left drain plugs (3) and filling plug (2) at the front axle case and drain the oil completely into the oil pan.
2. After draining reinstall the drain plugs (3).
3. Remove the oil level check plug (1).
4. Fill with the new oil up to the check plug port.
(See "LUBRICANTS" in Maintenance Section)
5. After filling reinstall the filling plug (2) check plug (1).

(4) Check Points of Every 600 Hours

Adjusting Front Axle Pivot
1. Jack up the tractor body, then loosen the lock nut (2).
2. Measure the adjusting screw tightening torque.
3. If tightening torque is not within the factory specifications, adjust the adjusting screw (1).
4. After adjustment, tighten the lock nut firmly.

(When reassembling)

(2) Tread Adjustment

(2)-1 Front Wheels

[4WD Type]

Front axle is not adjustable.
(2)-2 Rear Wheels

Rear tread can be adjusted in 6 steps depending on the model.

To change the tread
1. Lift the rear tires off the ground.
2. Follow the illustrations below to get the desired tread width.

<table>

</tbody>
</table>

⚠️ CAUTION

- When working on slopes or working with trailer, set the wheel tread as wide as practical for the job for maximum stability.

**IMPORTANT**

- Always attach tires as shown in the drawings below.
- If not attached as illustrated, transmission parts may be damaged.
- Do not use tires larger than specified.

## [4] SPECIFICATIONS OF IMPLEMENT LIMITATIONS

The KUBOTA Tractor has been thoroughly tested for proper performance with implements sold or approved by KUBOTA. Use with implements which exceed the maximum specifications listed below, or otherwise unfit for use with the KUBOTA Tractor may result in malfunctions or failures of the tractor, damage to other property and injury to the operator or others. (Any malfunctions or failures of the tractor resulting from use with improper implements are not covered by the warranty.)

6 FRONT AXLE

[1] STRUCTURE

The front axle supports the front of tractor and facilitates steering.
There are two kinds of front axles.

The two-wheel drive axle has free-running front wheels and the four-wheel drive axle has powered front wheels.

(1) 4 Wheel Drive Type

The front axle of the 4WD is constructed as shown above. Power is transmitted from the transmission through the propeller shaft (24) and to the spiral bevel pinion shaft (21), then to the spiral bevel gear (5) after that to the differential gear.

The power through the differential is transmitted to the differential yoke shaft (4), and to the bevel gear shaft (15) in the bevel gear case (1).

The revolution is greatly reduced by the bevel gears (17), (13), then the power is transmitted to the axle (12).

The differential system allows each wheel to rotate at a different speed to make turning easier.

CHECKING, DISASSEMBLING AND SERVICING

### CHECKING AND ADJUSTING

#### Toe-in

1. Inflate the tires to the specified pressure.
2. Turn the front wheels straight ahead.
3. Measure the toe-in (A–B).
4. If the measurement is not within the factory specifications, adjust the tie-rod length.

<table>
<thead>
<tr>
<th>Toe-in (A–B)</th>
<th>Factory spec.</th>
<th>4WD</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 to 8 mm</td>
<td>0.08 to 0.32 in.</td>
<td></td>
</tr>
</tbody>
</table>

#### Toe-in Adjustment

1. Detach the snap ring (1).
2. Loosen the tie-rod nut (2).
3. Turn the tie-rod joint (3) to adjust the rod length until the proper toe-in measurement is obtained.
4. Retighten the tie-rod nut (2).
5. Attach the snap ring (1) of the tie-rod joint (3).

(1) Snap Ring  (2) Tie-rod Nut  (3) Tie-rod Joint
Axial Sway of Front Wheel
1. Jack up the front side of tractor.
2. Set a dial gauge on the outside of rim.
3. Turn the wheel slowly and read the runout of rim.
4. If the measurement exceeds the factory specifications, check the bearing, rim and front wheel hub.

<table>

Adjusting Front Axle Pivot
1. Jack up the tractor body, then loosen the lock nut (2).
2. Measure the adjusting screw tightening torque.
3. If tightening torque is not within the factory specifications, adjust the adjusting screw (1).
4. After adjustment, tighten the lock nut firmly.

(1) Adjusting Screw     (2) Lock Nut

Front Wheel Steering Angle (4WD Only)
1. Inflate the tires to the specified pressure.
2. Steer the wheels to the extreme right until the front gear case (1) contacts with the bevel gear case (2) at right hand side of the front axle.
3. If the front gear case (1) can not be contacted with the bevel gear case (2), shorten the length of stopper (3).
4. Keeping the front gear case (1) contact with the bevel gear case (2), make a specified clearance (A) as shown in the lower table.
5. After adjustment, secure the stopper with the lock nut (4).
6. For adjusting the left steering angle, perform the same procedure as mentioned in right steering angle.

DISASSEMBLING AND ASSEMBLING

(1) Separating Front Axle [4WD Type]

Draining Front Axle Case Oil
1. Place oil pans underneath the front axle case.
2. Remove the drain plug (1) both sides and filling port plug (2) to drain the oil.
3. After draining, reinstall the drain plugs (1) and filling port plug (2).

(When reassembling)
- Remove the filling port plug (2).
- Fill with the new oil.
- After filling, reinstall the filling port plug (2).

<table>

**IMPORTANT**
- Use KUBOTA SUPER UDT fluid or SAE 80, 90 gear oil.
- Refer to “LUBRICANTS, FUEL AND COOLING WATER”. (See page AG-1.)

(1) Drain Plug  (2) Filling Port Plug

Propeller Shaft (4WD Only)
1. Slide the propeller shaft cover (3), (5) after removing the screws (6).
2. Tap out the spring pin (2), (4) and then slide the coupling (1), (8) to the front and rear.

(When reassembling)
- Apply grease to the splines of the propeller shaft (7).

**Bevel Gear Case**
1. Remove the external snap ring (1).
2. Tap the bevel gear case (2) and separate it from the front gear case (3).

| (1) External Snap Ring (3) Front Gear Case |
| (2) Bevel Gear Case                        |
Bevel Gear Case Gears
1. Remove the internal snap ring (4).
2. Take out the bevel gears (5), (6) with ball bearings, and shims (7).

(When reassembling)
- Install the shims (7) to their original position.
- Install the oil seal (8) of bevel gear case, noting its direction.

(1) External Snap Ring  (5) Bevel Gear
(2) Bevel Gear Case  (6) Bevel Gear
(3) Front Gear Case  (7) Shim
(4) Internal Snap Ring  (8) Oil Seal

Axle
1. Remove the bearing with a special use puller set (Code No. 07916-09032).
2. Take out the bevel gear (2).
3. Take out the collar (1).
4. Tap out the axle (3).

(When reassembling)
- Install the oil seal (5) of axle flange (4), noting its direction as shown in the figure below.

(1) Collar  (4) Axle Flange
(2) Bevel Gear  (5) Oil Seal
(3) Axle
Steering Cylinder

1. Remove the tie-rod joint (1) (right side).
2. Remove the cylinder set screw (3).
3. Remove the nipples (2) from steering cylinder.
4. Remove the internal snap ring (4).
5. Draw out the steering cylinder (5).

(When reassembling)

- Apply liquid lock (Three Bond 1372 or equivalent) to the tie-rod joint.

Spiral Bevel Pinion Shaft and Differential Gear Assembly

1. Take out the differential yoke shaft (9), (10) both sides.
2. Remove the oil seal (6) and internal snap ring (5).
3. Remove the collar (4).
4. Remove the spiral bevel pinion shaft (3) by the pinion shaft remover (14).
5. Take out the differential gear assembly (2), ball bearing (7) and shim (8) from left side of front axle case (1).
6. Remove the stake of lock nut (11), and then remove the lock nut (11).
7. Remove the taper roller bearings (12).

(When reassembling)
- Replace the lock nut (11) and oil seal (6) with new ones.
- Apply grease to the oil seal (6).
- Install the shims and collars to their original position.
- Install the taper roller bearings correctly, noting their direction and apply gear oil to them.
- When press-fitting a oil seal (6), observe the dimension “A” described in the figure.

■ IMPORTANT
- After adjusting the turning torque, stake the lock nut (11) firmly.

The steering cylinder is single piston both rod double-acting type. This steering cylinder is installed parallel to the front axle and connected to tie-rods.

The tie-rods connected to both knuckle arm guarantees equal steering movement to both front wheels.

The steering cylinder provide force in both directions. Depending upon direction the steering wheel is turned pressure oil enters at one end of the cylinder to extend, or the other end to retract it, thereby turning front wheel of the tractor.

CHECKING, DISASSEMBLING AND SERVICING

[1] POWER STEERING HYDRAULIC PUMP

CHECKING

(1) Pump Test Using Flow-meter

- Preparation
  1. Remove the side cover RH (1) and front mask (2)
  2. Remove the front grille (3) and side skirt RH (4)
  3. Remove the delivery pipe (5) between the regulator valve (6) and power steering hydraulic pump (7)

  (When reassembling)
  - Install the copper washers (8) firmly.
  - Apply grease to the O-ring (9) and take care not to damage it.

<table>

Hydraulic Flow Test

**IMPORTANT**
- When using a flowmeter other than KUBOTA specified flowmeter, be sure to use the instructions with that flowmeter.
- Do not close the flowmeter loading valve completely, before testing, because it has no relief valve.

1. Install the adaptor 69 (PF 3/8) and adaptor 66 to the pump discharge port.
2. Connect the hydraulic test hose to the adaptor 66 and flowmeter inlet port.
3. Connect the other hydraulic test hose to the flowmeter outlet port and to transmission fluid filling plug hole.
4. Open the flowmeter loading valve completely. (Turn counterclockwise.)
5. Start the engine and set the engine speed at **2000 to 2200 rpm**.
6. Slowly close the loading valve to generate pressure approx. **9.8 MPa** (100 kgf/cm², 1422 psi). Hold in this condition until oil temperature reaches approx. 40 °C (104 °F).
7. Open the loading valve completely.
8. Set the engine speed. (Refer to **Condition**.)
9. Read and note the pump delivery at no pressure.
10. Slowly close the loading valve to increase rated pressure. (Refer to **Condition**.) As the load is increased, engine speed drops, therefore, reset the engine speed.
11. Read and note the pump delivery at rated pressure.
12. Open the loading valve completely and stop the engine.
13. If the pump delivery does not reach the allowable limit, check the pump suction line, oil filter or hydraulic pump.

### Condition

- **Engine speed**
  - Approx. 2700 rpm

- **Rated pressure**
  - [4WD Type]
  - 11.8 to 12.7 MPa
  - 120 to 130 kgf/cm²
  - 1707 to 1849 psi

- **Oil temperature**
  - 40 to 60 °C
  - 104 to 140 °F

[2] RELIEF VALVE
CHECKING

Relief Valve Setting Pressure Test
1. Remove the side cover RH (1).
2. Disconnect the delivery hose joint bolt (2) which connects delivery hose and regulator valve.
3. Take out the spring (4) and check valve (3).
4. Install the adaptor E and adaptor 58 of relief valve setting pressure tester to the regulator valve, and then set a thread joint, cable and pressure gauge.
5. Start the engine and set the engine speed at max. speed.
6. Fully turn the steering wheel to the left or right and read the pressure when the relief valve functions.
7. Stop the engine.
8. If the pressure is not within the factory specifications, check the pump delivery line, replace the relief valve assembly or repair the power steering.

<table>

[3] STEERING CYLINDER
DISASSEMBLING AND ASSEMBLING
[4WD Type]

Tie-rod
1. Remove the cylinder cover (1).
2. Disconnect the power steering hoses (2), (3) from cylinder.
3. Remove the set screw (4).
4. Place a disassembly stand under the engine and support it with a jack.
5. Pull out the cotter pin and remove the tie-rod end nuts.
6. Remove the tie-rod with a tie-rod end lifter (Code No. 07909-39051).

(When reassembling)
- After tightening the tie-rod end nut to the specified torque, install a cotter pin as shown in the figure left.

<table>
<thead>
<tr>
<th>Tightening torque</th>

Hydraulic Flow Test

■ IMPORTANT
- When using a flowmeter other than KUBOTA specified flowmeter, be sure to use the instructions with that flowmeter.
- Do not close the flowmeter loading valve completely, before testing, because it has no relief valve.

1. Install the adaptor 61 with O-ring to the pump discharge port.
2. Connect the hydraulic test hose to the adaptor 61 and flowmeter inlet port.
3. Connect the other hydraulic test hose to the flowmeter outlet port and to transmission fluid filling plug hole.
4. Open the flowmeter loading valve completely. (Turn counterclockwise.)
5. Start the engine and set the engine speed at 2000 to 2200 rpm.
6. Slowly close the loading valve to generate pressure approx. 14.7 MPa (150 kgf/cm², 2133 psi). Hold in this condition until oil temperature reaches approx. 40 °C (104 °F).
7. Open the loading valve completely.
8. Set the engine speed. (Refer to Condition.)
9. Read and note the pump delivery at no pressure.
10. Slowly close the loading valve to increase pressure approx. 17.16 MPa (175 kgf/cm², 2489 psi). As the load is increased, engine speed drops, therefore, reset the engine speed.
11. Read and note the pump delivery at rated pressure.
12. Open the loading valve completely and stop the engine.
13. If the pump delivery does not reach the allowable limit, check the pump suction line, oil filter or hydraulic pump.

When the main switch (3) is turned to the **ON** position, the terminal B is connected to the terminal AC then magnetizes the coil of glow relay (7).

The glow relay (7) is turned **ON**, the glow plugs (8) become red hot, and at the same time, light up the glow lamp on the meter panel.

When the main switch (3) is turned to the **START** position with the shuttle limit switch (4) (Mechanical transmission and GST Mode), HST switch (HST Model), clutch pedal switch (HST Model) and PTO limit switch (5) **ON**, after the glow lamp is put out light.

The terminal B is connected to the terminal AC, ST and G so that the starter motor (6) begins running and the glow plugs (8) are kept red hot.

The main switch (3) automatically returns to the **ON** position when it is released after the engine starts.

At the **ON** position, the starting circuit to be opened, stopping the starter motor (6).
SERVICING

[1] STARTING SYSTEM CHECKING

Checking HST Pedal Switch
1. Disconnect the 2P connector from HST pedal switch.
2. Connect the circuit tester to the 2P connector of switch.
3. Measure the resistance across the terminal 1 and 2.
4. If the HST pedal switch is defective, replace it.

<table>
<thead>
<tr>
<th>Resistance (Across switch terminal)</th>
