WORKSHOP MANUAL
TRACTOR

L3130, L3430, L3830, L4630, L5030

Kubota
TO THE READER

This Workshop Manual has been prepared to provide servicing personnel with information on the mechanism, service and maintenance of KUBOTA Tractor L3130, L3430, L3830, L4630 and L5030. It is divided into two parts, “Mechanism” and “Servicing” for each section.

■ Mechanism
Information on the construction and function are included. This part should be understood before proceeding with troubleshooting, disassembling and servicing.

Refer to Diesel engine / Tractor Mechanism Workshop Manual (Code No. 97897-01872 / 97897-18200) for the one which has not been described to this workshop manual.

■ Servicing
The heading “General” includes general precautions, check and maintenance and special tools. Other section, there are troubleshooting, servicing specification lists, checking and adjusting, disassembling and assembling, and servicing which cover procedures, precautions, factory specifications and allowable limits.

All information illustrations and specifications contained in this manual are based on the latest product information available at the time of publication.

The right is reserved to make changes in all information at any time without notice.

November 2003

SAFETY FIRST

This symbol, the industry’s “Safety Alert Symbol”, is used throughout this manual and on labels on the machine itself to warn of the possibility of personal injury. Read these instructions carefully. It is essential that you read the instructions and safety regulations before you attempt to repair or use this unit.

DANGER: Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.

WARNING: Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION: Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury.

IMPORTANT: Indicates that equipment or property damage could result if instructions are not followed.

NOTE: Gives helpful information.

BEFORE SERVICING AND REPAIRING

- Read all instructions and safety instructions in this manual and on your machine safety decals.
- Clean the work area and machine.
- Park the machine on a firm and level ground, and set the parking brake.
- Lower the implement to the ground.
- Stop the engine, and remove the key.
- Disconnect the battery negative cable.
- Hang a “DO NOT OPERATE” tag in operator station.
SAFETY STARTING
- Do not start the engine by shorting across starter terminals or bypassing the safety start switch.
- Do not alter or remove any part of machine safety system.
- Before starting the engine, make sure that all shift levers are in neutral positions or in disengaged positions.
- Never start the engine while standing on ground. Start the engine only from operator’s seat.

SAFETY WORKING
- Do not work on the machine while under the influence of alcohol, medication, or other substances or while fatigued.
- Wear close fitting clothing and safety equipment appropriate to the job.
- Use tools appropriate to the work. Makeshift tools, parts, and procedures are not recommended.
- When servicing is performed together by two or more persons, take care to perform all work safely.
- Do not work under the machine that is supported solely by a jack. Always support the machine by safety stands.
- Do not touch the rotating or hot parts while the engine is running.
- Never remove the radiator cap while the engine is running, or immediately after stopping. Otherwise, hot water will spout out from radiator. Only remove radiator cap when cool enough to touch with bare hands. Slowly loosen the cap to first stop to relieve pressure before removing completely.
- Escaping fluid (fuel or hydraulic oil) under pressure can penetrate the skin causing serious injury. Relieve pressure before disconnecting hydraulic or fuel lines. Tighten all connections before applying pressure.

AVOID FIRES
- Fuel is extremely flammable and explosive under certain conditions. Do not smoke or allow flames or sparks in your working area.
- To avoid sparks from an accidental short circuit, always disconnect the battery negative cable first and connect it last.
- Battery gas can explode. Keep sparks and open flame away from the top of battery, especially when charging the battery.
- Make sure that no fuel has been spilled on the engine.
VENTILATE WORK AREA
- If the engine must be running to do some work, make sure the area is well ventilated. Never run the engine in a closed area. The exhaust gas contains poisonous carbon monoxide.

PREVENT ACID BURNS
- Sulfuric acid in battery electrolyte is poisonous. It is strong enough to burn skin, clothing and cause blindness if splashed into eyes. Keep electrolyte away from eyes, hands and clothing. If you spill electrolyte on yourself, flush with water, and get medical attention immediately.

DISPOSE OF FLUIDS PROPERLY
- Do not pour fluids into the ground, down a drain, or into a stream, pond, or lake. Observe relevant environmental protection regulations when disposing of oil, fuel, coolant, electrolyte and other harmful waste.

PREPARE FOR EMERGENCIES
- Keep a first aid kit and fire extinguisher handy at all times.
- Keep emergency numbers for doctors, ambulance service, hospital and fire department near your telephone.
SAFETY DECALS

The following safety decals are installed on the machine. If a decal becomes damaged, illegible or is not on the machine, replace it. The decal part number is listed in the parts list.

(1) Part No. TA040-4965-2

⚠️ DANGER
TO AVOID POSSIBLE INJURY OR DEATH FROM A MACHINE RUNAWAY.
1. Do not start engine by shorting across starter terminals or bypassing the safety start switch. Machine may start in gear and move if normal starting circuitry is bypassed.
2. Start engine only from operator’s seat with transmission and PTO OFF. Never start engine while standing on the ground.

(2) Part No. TD054-9848-1 [Rear mount type ROPS]

⚠️ WARNING
TO AVOID INJURY OR DEATH FROM ROLL-OVER:
- Keep Roll-Over Protective Structures (ROPS) in the upright and locked position.
- There is no operator protection when the ROPS is in the folded position.
- Check the operating area and fold the ROPS only when absolutely necessary.
- Raise and lock ROPS as soon as vertical clearance allows.
- Read ROPS related instructions and warnings.

(3) Part No. TA040-4959-3

⚠️ WARNING
TO AVOID PERSONAL INJURY:
1. Keep PTO shield in place at all times.
2. Do not operate the PTO at speeds faster than the speed recommended by the implement manufacturer.
3. For trailing PTO-driven implements set drawbar at towing position (see operator’s manual).

(4) Part No. TA040-4956-2
Diesel fuel only. No fire

(5) Part No. TA040-4935-1

⚠️ WARNING
TO AVOID PERSONAL INJURY:
1. Attach pulled or towed loads to the drawbar only.
2. Use the 3-point hitch only with equipment designed for 3-point hitch usage.
(1) Part No. TA140-4992-1 [GST Type]

**WARNING**
BEFORE Dismounting Tractor:
1. **ALWAYS SET PARKING BRAKE.**
2. PARK ON LEVEL GROUND WHenever POSSIBLE.
   If parking on a slope, position tractor across the slope.
3. LOWER ALL IMPLEMENTS TO THE GROUND.
   Failure to comply to this warning may allow the wheels to slip, and could cause injury or death.
4. LOCK SHUTTLE SHIFT LEVER IN NEUTRAL POSITION AND STOP THE ENGINE.

(2) Part No. 6C140-4746-1

**WARNING**
TO AVOID PERSONAL INJURY:
Do not modify or repair a ROPS because welding, grinding, drilling or cutting any portion may weaken the structure.

(1) Part No. TA140-4933-1 [Manual Transmission Type]

**WARNING**
BEFORE Dismounting Tractor:
1. **ALWAYS SET PARKING BRAKE.**
2. PARK ON LEVEL GROUND WHenever POSSIBLE.
   If parking on a slope, position tractor across the slope.
3. LOWER ALL IMPLEMENTS TO THE GROUND.
   Failure to comply to this warning may allow the wheels to slip, and could cause injury or death.
4. LOCK SHUTTLE SHIFT LEVER IN NEUTRAL POSITION AND STOP THE ENGINE.

(1) Part No. TA240-4933-2 [HST Type]

**WARNING**
BEFORE Dismounting Tractor:
1. **ALWAYS SET PARKING BRAKE.**
   Leaving transmission in gear with the engine stopped will not prevent tractor from rolling.
2. PARK ON LEVEL GROUND WHenever POSSIBLE.
   If parking on a slope, position tractor across the slope.
3. LOWER ALL IMPLEMENTS TO THE GROUND.
   Failure to comply to this warning may allow the wheels to slip, and could cause injury or death.
4. STOP THE ENGINE.

[CABIN Type] [ROPS Type]

3TLABABCP006A
CAUTION

TO AVOID PERSONAL INJURY:
1. Read and understand the operator’s manual before operation.
2. Before starting the engine, make sure that everyone is at a safe distance from the tractor and that the PTO is OFF.
3. Do not allow passengers or other people on the tractor at any time.
4. Before allowing other people to use the tractor, have them read the operator’s manual.
5. Check the tightness of all nuts and bolts regularly.
6. Keep all shields in place and stay away from all moving parts.
7. Lock the two brake pedals together before driving on the road.
8. Slow down for turns, or rough roads, or when applying individual brakes.
9. On public roads use SMV emblem and hazard lights, if required by local traffic and safety regulations.
10. Pull only from the drawbar.
11. Before dismounting, lower the implement to the ground, set the parking brake, stop the engine and remove the key.
12. Securely support tractor and implements before working underneath.

DANGER EXPLOSIVE GASES
Cigarettes, flames or sparks could cause battery to explode and result in severe injury. Keep battery away from sparks, flames, and smoke. Keep all electrical connections dry and inspect periodically.

POISON CAUSES SEVERE BURNS
Contains sulfuric acid. Avoid contact with skin, eyes or clothing. In event of accident flush with water and call a physician immediately.

KEEP OUT OF REACH OF CHILDREN

(1) Part No. 35260-3491-4

(3) Part No.
32751-4958-1
Stay clear of engine fan and fan belt.

(2) Part No.
TD060-3012-1

(4) Part No.
TC030-4958-1
Do not touch hot surface like muffler etc.
(1) Part No. TA046-4932-1 [Mid mount type ROPS]

**WARNING**

TO AVOID INJURY OR DEATH FROM ROLL-OVER

- Keep roll-over protective structure (ROPS) in raised position.
- Check operating environment for vertical clearance for ROPS.
- In folded position, ROPS protection is eliminated.
- Raise ROPS if vertical clearance allows, and read related instructions and warnings.

(2) Part No. TA046-4928-2 [Mid mount type ROPS]

**IMPORTANT**

- RAISED POSITION
- Put spacer in hole and tighten bolt.

- FOLDED POSITION
- Put spacer and tighten bolt

**CAUTION**

TO AVOID INJURY WHEN RAISING OR LOWERING ROPS

- Stop and park the tractor.
- Hold center of ROPS by hand when lowering ROPS not to free-fall.
- Make sure bolts and spacers are installed correctly.

---

**CARE OF DANGER, WARNING AND CAUTION LABELS**

1. Keep danger, warning and caution labels clean and free from obstructing material.
2. Clean danger, warning and caution labels with soap and water, dry with a soft cloth.
3. Replace damaged or missing danger, warning and caution labels with new labels.
4. If a component with danger, warning or caution label (s) affixed is replaced with new part, make sure new label (s) is (are) attached in the same location (s) as the replaced component.
5. Mount new danger, warning and caution labels by applying on a clean dry surface and pressing any bubbles to outside edge.

1. TRACTOR IDENTIFICATION

When contacting your local KUBOTA distributor, always specify engine serial number, tractor serial number and hour meter reading.

(1) Tractor Identification Plate
(2) CABIN Identification Plate (CABIN Serial Number)
(3) Tractor Serial Number
(4) Engine Serial Number
(5) Hour Meter (IntelliPanel Display)
(6) ROPS Identification Plate (ROPS Serial Number)
2. GENERAL PRECAUTIONS

- During disassembly, carefully arrange removed parts in a clean area to prevent confusion later. Screws, bolts and nuts should be installed in their original position to prevent reassembly errors.
- When special tools are required, use KUBOTA genuine special tools. Special tools which are not frequently used should be made according to the drawings provided.
- Before disassembling or servicing electrical wires, always disconnect the ground cable from the battery first.
- Remove oil and dirt from parts before measuring.
- Use only KUBOTA genuine parts for parts replacement to maintain machine performance and to assure safety.
- Gaskets and O-rings must be replaced during reassembly. Apply grease to new O-rings or oil seals before assembling. See the figure left side.
- When reassembling external snap rings or internal snap rings, they must be positioned so that sharp edge faces against the direction from which a force is applied. See the figure left side.
- When inserting spring pins, their splits must face the direction from which a force is applied. See the figure left side.
- To prevent damage to the hydraulic system, use only specified fluid or equivalent.

(1) Grease
(2) Force
(3) Sharp Edge
(4) Axial Force
(5) Rotating Movement

(A) External Snap Ring
(B) Internal Snap Ring

KiSC issued 02, 2007 A
3. HANDLING PRECAUTIONS FOR ELECTRICAL PARTS AND WIRING

To ensure safety and prevent damage to the machine and surrounding equipment, heed the following precautions in handling electrical parts and wiring.

**IMPORTANT**
- Check electrical wiring for damage and loosened connection every year. To this end, educate the customer to do his or her own check and at the same time recommend the dealer to perform periodic check for a fee.
- Do not attempt to modify or remodel any electrical parts and wiring.
- When removing the battery cables, disconnect the negative cable first. When installing the battery cables, connect the positive cable first.

(1) Negative Terminal  (2) Positive Terminal

[1] WIRING

- Securely tighten wiring terminals.
  (1) Correct (Securely Tighten)  (2) Incorrect (Loosening Leads to Faulty Contact)

- Do not let wiring contact dangerous part.
  (1) Wiring (Correct)  (3) Dangerous Part
  (2) Wiring (Incorrect)  (4) Dangerous Part

- Securely insert grommet.
  (1) Grommet  (A) Correct  (B) Incorrect
• Securely clamp, being careful not to damage wiring.

(1) Clamp
   • Wind Clamp Spirally
(2) Wire Harness

W10114580

• Clamp wiring so that there is no twist, unnecessary sag, or excessive tension, except for movable part, where sag be required.

(1) Wiring
(2) Clamp
(A) Correct
(B) Incorrect

W10115870

• In installing a part, take care not to get wiring caught by it.

(1) Wiring
(A) Incorrect

W10116700

• After installing wiring, check protection of terminals and clamped condition of wiring, only connect battery.

(1) Cover
   • Securely Install Cover

W10117350
[2] BATTERY

- Take care not to confuse positive and negative terminal posts.
- When removing battery cables, disconnect negative cable first. When installing battery cables, check for polarity and connect positive cable first.
- Do not install any battery with capacity other than is specified (Ah).
- After connecting cables to battery terminal posts, apply high temperature grease to them and securely install terminal covers on them.
- Do not allow dirt and dust to collect on battery.

⚠️ CAUTION

- Take care not to let battery liquid spill on your skin and clothes. If contaminated, wash it off with water immediately.
- Before recharging the battery, remove it from the machine.
- Before recharging, remove cell caps.
- Do recharging in a well-ventilated place where there is no open flame nearby, as hydrogen gas and oxygen are formed.

[3] FUSE

- Use fuses with specified capacity. Neither too large or small capacity fuse is acceptable.
- Never use steel or copper wire in place of fuse.
- Do not install working light, radio set, etc. on machine which is not provided with reserve power supply.
- Do not install accessories if fuse capacity of reserve power supply is exceeded.

(1) Fuse  (2) Slow Blow Fuse

[4] CONNECTOR

- For connector with lock, push lock to separate.
  (A) Push

- In separating connectors, do not pull wire harnesses.
  Hold connector bodies to separate.
  (A) Correct  (B) Incorrect
• Use sandpaper to remove rust from terminals.
• Repair deformed terminal. Make certain there is no terminal being exposed or displaced.

(1) Exposed Terminal
(2) Deformed Terminal
(3) Sandpaper
(4) Rust

[5] HANDLING OF CIRCUIT TESTER

• Use tester correctly following manual provided with tester.
• Check for polarity and range.

■ NOTE

Engine Oil

- Oil used in the engine should have an American Petroleum Institute (API) service classification and Proper SAE Engine Oil according to the ambient temperatures as shown above.
- With the emission control now in effect, the CF-4 and CG-4 lubricating oils have been developed for use of a low-sulfur fuel on on-road vehicle engines. When an off-road vehicle engine runs on a high-sulfur fuel, it is advisable to employ the CF, CD or CE lubricating oil with a high total base number. If the CF-4 or CG-4 lubricating oil is used with a high-sulfur fuel, change the lubricating oil at shorter intervals.
- Lubricating oil recommended when a low-sulfur or high-sulfur fuel is employed.

### IMPORTANT
- The jobs indicated by ★ must be done after the first 50 hours of operation.
- *1: Air cleaner should be cleaned more often in dusty conditions than in normal conditions.
- *2: Every year or every 6 times of cleaning.
- *3: Replace only if necessary.
- *4: Consult your local KUBOTA distributor for this service.
- *5: When the battery is used for less than 100 hours per year, check the battery condition by reading the indication annually.
- The items listed above (@ marked) are registered as emission related critical parts by KUBOTA in the U.S.EPA nonroad emission regulation. As the engine owner, you are responsible for the performance of the required maintenance on the engine according to the above instruction. Please see the Warranty Statement in detail.

7. CHECK AND MAINTENANCE

⚠️ CAUTION

• Be sure to check and service the tractor on a flat place with engine shut off, the parking brake on and chock the wheels.

[1] DAILY CHECK

To prevent trouble from occurring, it is important to know the condition of the tractor. Check the following items before starting.

Checking

• Check areas where previous trouble was experienced.
• Walk around the tractor.
1. Check the tire pressure, and check for wear and damage.
2. Check for oil and water leak.
3. Check the engine oil level.
4. Check the transmission fluid level.
5. Check the coolant level.
6. Check the condition of ROPS attaching hardware.
7. Check and clean the radiator screen, grill and oil cooler. (HST only)
8. Check and clean the air condenser screen. (CABIN only)
9. Check the screws and nuts of tires are tight.
10. Check the number plate.
11. Care of danger, warning and caution labels.
12. Clean around the exhaust manifold and the muffler of the engine.
13. Check the fuel level.
14. Check the dust indicator.
• While sitting in the operator’s seat.
1. Check the brake pedals and clutch pedal.
2. Check the parking brake.
3. Check the steering wheel.
• Turning the key switch.
1. Check the performance of the easy checker lights.
2. Check the lights, turn signal lights, hazard lights and other light equipment. Clean if necessary.
3. Check the performance of the meters and gauges.
• Starting the engine.
1. Check to see that the lights on the easy checker go off.
2. Check the color of the exhaust gas.
3. Check the brakes for proper operation.
[2] CHECK POINTS OF INITIAL 50 HOURS

Changing Engine Oil

**CAUTION**
- Before changing oil, be sure to stop the engine.
- Allow engine to cool down sufficiently, oil can be hot and can burn.

1. Start and warm up the engine for approx. 5 minutes.
2. Place an oil pan underneath the engine.
3. To drain the used oil, remove the both drain plugs (1) at the bottom of the engine and drain the oil completely.
4. Screw in the both drain plugs (1).
5. Fill new oil up to upper line on the dipstick (2).

**IMPORTANT**
- When using an oil of different manufacture or viscosity from the previous one, remove all of the old oil.
- Never mix two different types of oil.
- Use the proper SAE Engine Oil according to ambient temperatures.
- Refer to “LUBRICANTS, FUEL AND COOLANT”. (See page G-7, 8.)

<table>

Replacing Engine Oil Filter Cartridge

**CAUTION**
- Be sure to stop the engine before changing oil filter cartridge.
- Allow engine to cool down sufficiently, oil can be hot and can burn.

1. Remove the oil filter cartridge with the filter wrench.
2. Apply a slight coat of oil onto the new cartridge gasket.
3. To install the new cartridge, screw it in by hand. Over tightening may cause deformation of rubber gasket.
4. After the new cartridge has been replaced, the engine oil normally decrease a little. Thus see that the engine oil does not leak through the seal and be sure to read the oil level on the dipstick. Then, replenish the engine oil up to the specified level.

**IMPORTANT**
- To prevent serious damage to the engine, replacement element must be highly efficient. Use only a KUBOTA genuine filter or its equivalent.

(1) Engine Oil Filter Cartridge
Replacing Hydraulic Oil Filter / Replacing Transmission Oil Filter [HST Type]

**CAUTION**
- Be sure to stop the engine before changing the oil filter cartridge.
- Allow engine to cool down sufficiently, oil can be hot and can burn.

1. Remove the drain plugs at the bottom of the transmission case and drain the oil completely into the oil pan.
2. After draining, reinstall the drain plugs.
3. Remove the oil filter.
4. Put a film of clean transmission oil on the rubber seal of the new filter.
5. [Hydraulic oil filter]
   Quickly tighten the filter until it contacts the mounting surface, then tighten it by hand an additional 1/2 turn only.
   [Transmission oil filter]
   Quickly tighten the filter until it contacts the mounting surface, then with a filter wrench, tighten it an additional 1 turn only.
6. After the new filters have been replaced, fill the transmission oil up to the upper notch on the dipstick.
7. After running the engine for a few minutes, stop the engine and check the oil level again, add oil to the prescribed level.
8. Make sure that the transmission fluid does not leak past the seal on the filter.

**IMPORTANT**
- To prevent serious damage to the hydraulic system, use only a KUBOTA genuine filter.

(A) Oil level is acceptable within this range.

Changing Transmission Fluid

**CAUTION**
- Be sure to stop the engine checking and changing the transmission fluid.
- Allow engine to cool down sufficiently, oil can be hot and can burn.

1. Place an oil pan under the tractor.
2. Remove the drain plugs (1) at the bottom of the transmission case.
3. Drain the transmission fluid.
4. After draining, screw in the drain plugs.
5. Fill new oil from filling port after removing the filling plug (2) up to the upper line of the dipstick (3).
6. After running the engine for a few minutes, stop it and check the oil level again, if low, add oil prescribed level.

**IMPORTANT**
- Use only multi-grade transmission oil. Use of other oils may damage the transmission or hydraulic system. Refer to “LUBRICANTS, FUEL AND COOLANT”. (See page G-7, 8.)
- Never work the tractor immediately after changing the transmission oil. Keeping the engine at medium speed for a few minutes to prevents damage to the transmission.
- Do not mix different blands oil together.

| Transmission fluid capacity | L3130, L3430          | 42 L

(1) Drain Plug  
(2) Filling Plug  
(3) Dipstick  
(A) Oil level is acceptable within this range.
Changing Front Axle Case Oil

⚠️ CAUTION
- Be sure to stop the engine before changing the front axle case oil.
- Allow engine to cool down sufficiently, oil can be hot and can burn.

1. Remove the right and left drain plugs (3) and filling plug (2) at the front axle case and drain the oil completely.
2. After draining, reinstall the drain plugs (3).
3. Remove the right and left check plugs (1).
4. Fill new oil from filling port with specified amount of oil.
   Refer to “LUBRICANTS, FUEL AND COOLANT”. (See page G-7, 8.)
5. Reinstall the filling plug (2) and check plug (1).

Adjusting Brake Pedal Free Travel

⚠️ CAUTION
- Stop the engine and chock the wheels before checking brake pedal.

1. Release the parking brake.
2. Slightly depress the brake pedals and measure free travel (L) at top of pedal stroke.
3. If the measurement is not within the factory specifications, loosen the lock nut (1) and turn the turnbuckle (2) to adjust the rod length within acceptable limits.
4. Retighten the lock nut (1) securely.
   Keep the free travel in the right and left brake pedals equal.

KiSC issued 02, 2007 A
[3] CHECK POINTS OF EVERY 50 HOURS

Greasing

1. Apply a grease to the following position as figures.

■ NOTE

- Apply a small amount of multipurpose grease to the following points every 50 hours.
  If you operated the machine in extremely wet and muddy conditions, lubricate grease fittings more often.
- When apply a grease to the front axle support, remove the breather plug and apply a grease until grease overflows from breather plug. After greasing reinstall the plug.

1. Grease Fitting (Front Wheel Case Support RH, LH)
2. Grease Fitting (Front Axle Support)
3. Breather Plug
4. Grease Fitting (Lift Cylinder)
5. Grease Fitting (Top Link)
6. Grease Fitting (Lifting Rod RH)
7. Grease Fitting (Toplink Bracket)
8. Battery Terminal

KiSC issued 02, 2007 A
Oiling

⚠️ CAUTION
- Be sure to stop the engine and remove the key before oiling.

(1) Hand Throttle Cable  
(2) Foot Throttle Cable  
(GST/Manual Transmission Type)

W1072984

Checking Engine Start System
(GST/Manual Transmission Type)

⚠️ CAUTION
- Do not allow anyone near the tractor while testing.
- If the tractor does not pass the test, do not operate the tractor.

■ Preparation before testing.
1. Place all control levers in the “NEUTRAL” position.
2. Set the parking brake and stop the engine.

■ Test 1: Switch for the shuttle shift lever.
1. Sit on operator’s seat.
2. Shift the shuttle shift lever to the forward or reverse position.
3. Depress the clutch pedal fully.
4. Disengage the PTO clutch control lever.
5. Turn the key to “START” position.
6. The engine must not crank.

■ Test 2: Switch for the PTO clutch control lever.
1. Sit on operator’s seat.
2. Engage the PTO clutch control lever.
3. Depress the clutch pedal fully.
4. Shift the range gear shift lever to the neutral position.
5. Turn the key to “START” position.
6. The engine must not crank.

■ If it cranks at the test 1 or 2, adjust or replace the required safety switch.

(1) Shuttle Shift Lever  
(2) Clutch Pedal  
(3) PTO Clutch Control Lever

W10312010
Checking Engine Start System (HST Type)
1. Place all control levers in the “NEUTRAL” position.
2. Set the parking brake and stop the engine.

■ Test 1 : Switch for the speed control lever.
1. Sit on operator’s seat.
2. Depress the speed control pedal to the desired direction.
3. Depress the clutch pedal fully.
4. Disengage the PTO clutch control lever.
5. Turn the key to “START” position.
6. The engine must not crank.

■ Test 2 : Switch for the PTO clutch control lever.
1. Sit on operator’s seat.
2. Engage the PTO clutch control lever.
3. Depress the clutch pedal fully.
4. Place the speed control pedal to the neutral position.
5. Turn the key to “START” position.
6. The engine must not crank.

■ Test 3 : Switch for the clutch pedal.
1. Sit on operator’s seat.
2. Disengage the PTO clutch control lever.
3. Place the speed control pedal to the neutral position.
4. Release the clutch pedal.
5. Turn the key to “START” position.
6. The engine must not crank.

■ If it cranks at the test 1, 2 or 3, adjust or replace the required safety switch.

Checking Wheel Mounting Screws and Nuts Tightening Torque

CAUTION
Never operate tractor with a loose rim, wheel, or axle.
1. Check wheel screws and nuts regularly especially when new. If there are loosened, tighten as follows.

<table>
<thead>
<tr>
<th>Tightening Torque</th>
<th>Front Wheel Mounting Nuts</th>
<th>Rear Wheel Mounting Screws and Nuts</th>
</tr>
</thead>
<tbody>
<tr>

<td>100 ft-lbs</td>
<td>166 ft-lbs</td>
</tr>
</tbody>
</table>

(1) Front Wheel Mounting Nut  (2) Rear Wheel Mounting Screw and Nut
[4] CHECK POINTS OF EVERY 100 HOURS

Changing Engine Oil

Adjusting Brake Pedal

Cleaning Air Cleaner Primary Element
1. Remove the air cleaner cover and primary element.
2. Clean the primary element:
   - When dry dust adheres to the element, blow compressed air from the inside turning the element. Pressure of compressed air must be under 205 kPa (2.1 kgf/cm², 30 psi).
   - When carbon or oil adheres to the element, soak the element in detergent for 15 minutes then wash it several times in water, rinse with clean water and dry it naturally. After element is fully dried, inspect inside of the element with a light and check if it is damaged or not.
3. Replace air cleaner primary element:
   Once yearly or after every six times of cleaning, whichever comes first.

■ NOTE
• Check to see if the evacuator valve is blocked with dust.

■ IMPORTANT
• The air cleaner uses a dry element, never apply oil.
• Do not run the engine with filter element removed.
• Be sure to refit the cover with the arrow ↑ (on the rear of cover) upright. If the cover is improperly fitted, evacuator valve will not function and dust will adhere to the element.
• Do not touch the secondary element except in cases where replacing is required.
See “Replacing Air Cleaner Secondary Element” in Every 1 Year section. (See page G-32.)

■ Evacuator Valve
Open the evacuator valve (4) once a week under ordinary conditions or daily when used in a dusty place to get rid of large particles of dust and dirt.
Cleaning Fuel Filter
This job should not be done in the field, but in a clean place.
1. Close the fuel filter cock (1).
2. Unscrew the screw ring and remove the fuel filter bowl (2), and rinse the inside with kerosene.
3. Take out the filter element (4) and dip it in the kerosene to rinse.
4. After cleaning, reassemble the fuel filter, keeping out dust and dirt.
5. Bleed the fuel system. (See page G-34.)

**IMPORTANT**
- If dust and dirt enters the fuel system the fuel pump and injection nozzles are subject to premature wear. To prevent this, be sure to clean the fuel filter and element bowl periodically.

![Diagram of fuel filter components]

Adjusting Fan Belt Tension

**CAUTION**
- Be sure to stop the engine before checking fan belt tension.
1. Stop the engine and remove the key.
2. Apply moderate thumb pressure to belt between pulleys.
3. If tension is incorrect, loosen the alternator mounting bolts and using a lever placed between the alternator and the engine block, pull the alternator out until the deflection of the belt falls within the factory specifications.
4. Replace fan belt if it is damaged.

<table>
<thead>
<tr>
<th>Fan belt tension</th>
<th>Factory spec.</th>
<th>A deflection of between 7 to 9 mm (0.28 to 0.34 in.) when the belt is pressed in the middle of the span.</th>

KiSC issued 02, 2007 A
Checking Fuel Line

⚠️ CAUTION
- Stop the engine when attempting the check and change prescribed below.
- Remember to check the fuel line periodically. The fuel line is subject to wear and aging, fuel may leak out onto the running engine, causing a fire.

1. Check to see that all line and hose clamp are tight and not damaged.
2. If hoses and clamps are found worn or damaged, replace or repair them at once.
3. The fuel line is made of rubber and ages regardless of period of service. Replace the fuel pipe together with the clamp every two years and securely tighten.
4. However if the fuel pipe and clamp are found damaged or deteriorated earlier than two years, then change or remedy.
5. After the fuel line and clamp have been changed, bleed the fuel system.

■ IMPORTANT
- When the fuel line is disconnected for change, close both ends of the fuel line with a piece of clean cloth or paper to prevent dust and dirt from entering. Entrance of dust and dirt causes malfunction of the fuel injection pump. In addition, particular care must be taken not to admit dust and dirt into the fuel pump.

Adjusting Clutch Pedal Free Travel

⚠️ CAUTION
- When checking, park the tractor on flat ground, apply the parking brake, stop the engine and remove the key.

1. Slightly depress the clutch pedal and measure free travel “L” at top of clutch pedal.
2. If the measurement is not within the factory specifications, loosen the lock nut (2), remove the clevis pin (3) adjust the length of rod (1) within acceptable limits.
3. Retighten the lock nut (2) and split the cotter pin.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
Checking Battery Condition

To avoid the possibility of battery explosion:
For the refillable type battery, follow the instructions below.
• Do not use or charge the refillable type battery if the fluid level is below the LOWER (lower limit level) mark. Otherwise, the battery component parts may prematurely deteriorate, which may shorten the battery’s service life or cause an explosion. Check the fluid level regularly and add distilled water as required so that the fluid level is between the UPPER and LOWER levels.

⚠️ CAUTION
• Never remove the vent plugs while the engine is running.
• Keep electrolyte away from eyes, hands and clothes. If you are spattered with it, wash it away completely with water immediately and get medical attention.
• Wear eye protection and rubber gloves when working around battery.

ʦ NOTE
• The factory-installed battery is of non-refillable type. If the indicator turns white, do not charge the battery but replace it with new one.

1. Mishandling the battery shortens the service life and adds to maintenance costs.
2. The original battery is maintenance free type battery, but need some servicing.
   If the battery is weak, the engine is difficult to start and the lights be dim. It is important check the battery periodically.
3. Check the battery condition by reading the indicator.
   State of indicator display.
   Green: Specify gravity of electrolyte and quality of electrolyte are both in good condition.
   Black: Need charging battery.
   White: Need charging battery.

(1) Battery (2) Indicator

KiSC issued 02, 2007 A

W1095602
## Battery Charging

### CAUTION
- When the battery is being activated, hydrogen and oxygen gases in the battery are extremely explosive. Keep open sparks and flames away from the battery at all times, especially when charging the battery.
- When charging battery, remove battery vent plugs.
- When disconnecting the cable from the battery, start with the negative terminal first.
- When connecting the cable to the battery, start with the positive terminal first.
- Never check battery charge by placing a metal object across the posts.

Use a voltmeter or hydrometer.

1. To slow charge the battery, connect the battery positive terminal to the charger positive terminal and the negative to the negative, then recharge in the standard fashion.
2. A boost charge is only for emergencies. It will partially charge the battery at a high rate and in a short time.
   - When using a boost-charged battery, it is necessary to recharge the battery as early as possible.
   - Failure to do this will shorten the battery’s service life.
3. The battery is charged if the indicator display turns green from black.
4. When exchanging an old battery into new one, use battery of equal specification shown in table 1.

### Table 1

<table>

### Direction for Storage

1. When storing the tractor for long periods of time, remove the battery from tractor, adjust the electrolyte to the proper level and store in a dry place out of direct sunlight.
2. The battery self-discharges while it is stored.
   - Recharge it once every three months in hot seasons and once every six months in cold seasons.

(1) Battery
Adjusting Parking Brake Lever

CAUTION
• Stop the engine and chock the wheels before checking parking brake.

1. Raise the parking brake lever (1) to the parking position while counting the ratchet sound made by the parking brake lever (1).
2. If adjustment is needed, loosen the lock nut (2) and adjust the parking brake cable (3) length with in acceptable limit.
3. Retighten the lock nut (2).

### Proper parking brake lever free travel

Replacing Engine Oil Filter Cartridge

Replacing Hydraulic Oil Filter / Replacing Transmission Oil Filter [HST Type]

1. See page G-16.

Checking Radiator Hose and Hose Clamp

Check to see if radiator hoses are properly fixed every 200 hours of operation or six months, whichever comes first.

1. If hose clamps are loose or water leaks, tighten bands securely.
2. Replace hoses and tighten hose clamps securely, if radiator hoses are swollen, hardened or cracked.
3. Replace hoses and hose clamps every 2 years or earlier if checked and found that hoses are swollen, hardened or cracked.

**Precaution at Overheating**

Take the following actions in the event the coolant temperature be nearly or more than the boiling point, what is called “Overheating”.

1. Stop the machine operation in a safe place and keep the engine unloaded idling.
2. Don’t stop the engine suddenly, but stop it after about 5 minutes of unloaded idling.
3. Keep yourself well away from the machine for further 10 minutes or while the steam blown out.
4. Checking that there gets no danger such as burn, get rid of the causes of overheating according to the manual, see “Troubleshooting” section, and then, start again the engine.

(1) Radiator Hose
(2) Clamp
Adjusting Toe-in
1. Park the tractor on the flat place.
2. Inflate the tires to the specified pressure.
3. Turn steering wheel so front wheels are in the straight ahead position.
4. Lower the implement, lock the parking brake and stop the engine.
5. Measure distance between tire beads at front of tire, hub height.
6. Measure distance between tire beads at rear of tire, hub height.
7. Front distance should be 2 to 8 mm (0.079 to 0.315 in.) less than rear distance.
8. If the measurement is not within the factory specifications, adjust by changing the tie-rod length.

<table>
<thead>
<tr>
<th>Toe-in (B - A)</th>
<th>Factory spec.</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 to 8 mm</td>
<td>0.079 to 0.315 in.</td>
</tr>
</tbody>
</table>

Adjusting
1. Detach the snap ring (1).
2. Loosen the tie-rod nut (2) and turn the tie-rod joint (3) to adjust the tie-rod length until the proper toe-in measurement is obtained.
3. Retighten the tie-rod nut (2).
4. Attach the snap ring (1) of the tie-rod joint.

<table>

(2) Tie-rod Nut
(3) Tie-rod Joint

(A) Wheel to Wheel Distance at front
(B) Wheel to Wheel Distance at rear
(C) Front
Checking HST Oil Line [HST Type] / Checking Power Steering Line

1. Check to see that all lines and hose clamps are tight and not damaged.
2. If hoses and clamps are found worn or damaged, replace repair them at once.

(A) HST Type

Adjusting Air Conditioner Belt Tension (Cabin Model)

**CAUTION**

- Be sure to stop the engine before checking air conditioner belt tension.
1. Stop the engine and remove the key.
2. Apply 98 N (10 kgf, 22 lbs) pressure to the belt between the pulleys.
3. If tension is incorrect, adjust the belt tension.
4. If belt is damaged, replace it.

<table>
<thead>
<tr>
<th>Air conditioner belt tension</th>

KiSC issued 02, 2007 A
Cleaning Inner Air Filter (Cabin Model)

1. Remove the inner filter, and blow air from the direction opposite to the filter’s normal air flow.

(Reference)
- Detach and attach the push-rivet (2) as follows.
  - Detaching procedure (A)
    Push in the center rivet (a) and pull out the push-rivet assembly (b).
  - Attaching procedure (B)
    Pull out the center rivet (c), attach the push-rivet assembly (d) and push up the center-rivet (e).

Cleaning Air Filter (Cabin Model)

■ Fresh Air Filter

1. Remove the knob bolts (3) and pull out the fresh air filter (1).
2. Blow air from the opposite direction to the filter’s normal air flow.

■ NOTE
- If the filter is very dirty:
  Dip the filter in lukewarm water with mild dish washing detergent.
  Move it up and down as well as left and right to loosen dirt. Rinse the filter with clean water and let it air-dry.

■ IMPORTANT
- Do not use gasoline, thinner or similar chemicals to clean the filter as damage to the filter may occur.
- If may also cause an unpleasant odor in the CABIN when the system is used next.
- Do not hit the filter. If the filter becomes deformed, dust may enter into the air-conditioner, which may cause damage and malfunction.
Checking Air Conditioner Condenser (Cabin Model)
1. Check the air conditioner condenser (1).
2. If dust and dirt, wash off all dirt and dust from the condenser (1) with a soft brush, use care not to damage or bend the fins.

(1) Air Conditioner Condenser

[6] CHECK POINTS OF EVERY 400 HOURS

Changing Transmission Fluid
1. See page G-17.

Changing Front Axle Case Oil

Replacing Fuel Filter Element
1. See page G-23.

[7] CHECK POINTS OF EVERY 600 HOURS

Adjust Front Axle Pivot
1. Loosen the lock nut (2), tighten the adjusting screw (1) all the way, and then loosen the adjusting screw (1) by 1/6 turn.
2. Retighten the lock nut (2).

■ NOTE
• If the axle pivot pin adjustment is not correct, front wheel vibration can occur causing vibration in the steering wheel.

(Reference)

(1) Adjusting Screw  (2) Lock Nut

[8] CHECK POINTS OF EVERY 800 HOURS

Checking Valve Clearance
1. See page 1-S27.
[9] CHECK POINTS OF EVERY 1 YEAR

Replacing Air Cleaner Primary Element and Secondary Element
1. Replace the both primary and secondary elements.
   Refer to “Cleaning Air Cleaner Primary Element”. (See page G-22.)

Checking Air Conditioner Pipe and Hose
1. Check to see that all lines and hose clamps are tight and not damaged.
2. If hoses (1) and clamps are found worn or damaged, replace or repair them at once.
   (1) Hose

Checking Cabin Isolation Cushion
1. Check the isolation cushion (1) for any breakage or fatigue.
2. Replace them if they have deteriorated.
   (1) Isolation Cushion

[10] CHECK POINTS OF EVERY 2 YEARS

Replacing Fuel Hose
1. Replace the fuel hoses and clamps, if necessary.
   Refer to “Checking Fuel Line”. (See page G-24.)

Replacing Parking Brake Cable
1. Replace the cable.
   Refer to “Adjusting Parking Brake Lever”. (See page G-27.)

Replacing HST Oil Line
1. Replace the hoses and clamps.
   Refer to “Checking HST Oil Line and Power Steering Line”. (See page G-29.)

Replacing Power Steering Hose
1. Replace the hoses and clamps.
   Refer to “Checking HST Oil Line and Power Steering Line”. (See page G-29.)

Replacing Radiator Hose (Water Pipes)
1. Replace the hoses and clamps.
   Refer to “Checking Radiator Hose and Hose Clamp”. (See page G-27.)
Flushing Cooling System and Changing Coolant

**CAUTION**
- Do not remove the radiator cap when the engine is hot. Then loosen cap slightly to the stop to relieve any excess pressure before removing cap completely.
- Stop the engine and let cool down.
- To drain the coolant, open the radiator drain plug (3) and remove the radiator cap (1). The radiator cap (1) must be removed to completely drain the coolant.
- After all coolant is drained, close the drain plug (3).
- Fill with clean water and cooling system cleaner.
- Follow directions of the cleaner instruction.
- After flushing, fill with clean water and anti-freeze until the coolant level is just below the port. Install the radiator cap (1) securely.
- Fill with coolant up to “FULL” mark on the recovery tank.
- Start and operate the engine for few minutes.
- Stop the engine and let cool. Check coolant level of recovery tank (2) and add coolant if necessary.

**IMPORTANT**
- Do not start engine without coolant.
- Use clean, fresh water and anti-freeze to fill the radiator and recovery tank.
- When the anti-freeze is mixed with water, the anti-freeze mixing ratio must be less than 50%.
- Securely tighten radiator cap. If the cap is loose or improperly fitted, water may leak out and the engine could overheat.
- Refer to “LUBRICANTS, FUEL AND COOLANT”. (See page G-7, 8.)

Flush Cooling System and Changing Coolant (Continued)

■ Anti-Freeze
If coolant freezes, it can damage the cylinders and radiator. It is necessary, if the ambient temperature falls below 0 °C (32 °F), to remove coolant after operating or to add anti-freeze to it.

1. There are two types of anti-freeze available; use the permanent type (PT) for this engine.
2. Before adding anti-freeze for the first time, clean the radiator interior by pouring fresh water and draining it a few times.
3. The procedure for mixing of water and anti-freeze differs according to the make of the anti-freeze and the ambient temperature, basically it should be referred to SAE J1034 standard, more specifically also to SAE J814c.
4. Mix the anti-freeze with water, and then fill in to the radiator.

<table>
<thead>

<td>−34</td>
</tr>
</tbody>
</table>

*At 760 mmHg pressure (atmospheric). A higher boiling points is obtained by using a radiator pressure cap which permits the development of pressure within the cooling system.

■ NOTE
- The above data represent industry standards that necessitate a minimum glycol content in the concentrated anti-freeze.
- When the coolant level drops due to evaporation, add water only. In case of leakage, add anti-freeze and water in the specified mixing ratio.
- Anti-freeze absorbs moisture. Keep unused anti-freeze in a tightly sealed container.
- Do not use radiator cleaning agents when anti-freeze has been added to the coolant. (Anti-freeze contains an anti-corrosive agent, which will react with the radiator cleaning agent forming sludge which will affect the engine parts.)

Bleeding Fuel System
Air must removed:

1. When the fuel filter or lines are removed.
2. When tank is completely empty.
3. After the tractor has not been used for a long period of time.

Bleeding procedure is as follows.

1. Fill the fuel tank with fuel, and open the fuel cock (1).
2. Open the air vent cock (2) on the fuel injection pump.
3. Start the engine and run for about 30 seconds, and then stop the engine.
4. Close the air vent cock.

■ IMPORTANT
- Always close the air vent cock except for bleeding fuel lines. Otherwise, engine runs irregularly or stalls frequently.

(1) Fuel Cock  A : Close
(2) Air Vent Cock  B : Open
Draining Clutch Housing Water

**NOTE**
- The tractor is equipped with split pin plug (1) under the clutch housing.
- After operating in rain, snow or tractor has been washed, water may get into the clutch housing.

1. Check it by pushing in the split pin (1).
2. If water enters into the clutch housing, remove the plug (1) and drain the water, then reinstall the plug.

(1) Split Pin (Plug)
Replacing Fuse

1. The tractor electrical system is protected from potential damage by fuses. A blown fuse indicates that there is an overload or short somewhere in the electrical system.

2. If any of the fuses should blow, replace with a new one of the same capacity.

**IMPORTANT**

- Before replacing a blown fuse, determine why the fuse blew and make any necessary repairs. Failure to follow this procedure may result in serious damage to the tractor electrical system. Refer to troubleshooting section of this manual.

If any of them should blow, replace with a new one of the same capacity.

Replacing Light Bulb

1. Head lights and rear combination lights:
   Take the bulb out of the light body and replace with a new one.
2. Other lights:
   Detach the lens and replace the bulb.

(1) Washer Liquid Tank
Checking Refrigerant (Gas)

⚠️ CAUTION
- Liquid contact with eyes or skin may cause frostbite.
- In the event of a leakage, wear safety goggles. Escaping refrigerant can cause severe injuries to eyes.
- In contact with a flame, R134a refrigerant gives a toxic gas.
- Do not disconnect any part of the refrigeration circuit of the air conditioning system.

A shortage of refrigerant impairs the air-conditioner performance. Check the following points. If it is indicated that the amount of refrigerant is extremely low, inspect and charge. (See page 10-S21.)

■ Checking Procedure
1. Run the air-conditioner in the following conditions.
   - Engine speed : About 1500 min\(^{-1}\) (rpm)
   - Temperature control lever : Maximum cooling position (leftmost)
   - Fan switch : Highest blow (HI)
   - Air-conditioner switch : ON
2. Look into the sight glass (1) to see if the refrigerant is flowing through its circuit.

■ IMPORTANT
- Charge only with R134a not R12 refrigerant (gas).

(A) Proper : Little or no air bubbles in the refrigerant flow.
(B) Low : Lots of air bubbles in the refrigerant flow (air bubbles or foam passing continuously).
(C) Overfull or no refrigerant : Colorless and transparent.

W1120282
8. SPECIAL TOOLS

[1] SPECIAL TOOLS FOR ENGINE

**Special Use Puller Set**

Code No.: 07916-09032  
Application: Use exclusively for pulling out bearing, gears and other parts with ease.

**Piston Ring Compressor**

Code No.: 07909-32111  
Application: Use exclusively for pushing in the piston with piston rings into the cylinder.

**Piston Ring Tool**

Code No.: 07909-32121  
Application: Use exclusively for removing or installing the piston ring with ease.

**Diesel Engine Compression Tester**

Code No.: 07909-30208 (Assembly)  07909-31251 (G)  07909-30934 (A to F)  07909-31271 (I)  07909-31211 (E and F)  07909-31281 (J)  07909-31231 (H)  
Application: Use to measure diesel engine compression and diagnostics of need for major overhaul.

(1) Gauge  (7) Adaptor F  
(2) L Joint  (8) Adaptor G  
(3) Adaptor A  (9) Adaptor H  
(4) Adaptor B  (10) Adaptor I  
(5) Adaptor C  (11) Adaptor J  
(6) Adaptor E
**Oil Pressure Tester**
Code No.: 07916-32032
Application: Use to measure lubricating oil pressure.

**Valve Seat Cutter**
Code No.: 07909-33102
Application: Use to reseat valves.
Angle: 0.785 rad (45°)
0.262 rad (15°)
Diameter: 28.6 mm (1.126 in.)
31.6 mm (1.244 in.)
35.0 mm (1.378 in.)
38.0 mm (1.496 in.)
41.3 mm (1.626 in.)
50.8 mm (2.000 in.)

**Radiator Tester**
Code No.: 07909-31551
Application: Use to check of radiator cap pressure, and leaks from cooling system.
Remarks: Adapter (1) BANZAI Code No. RCT-2A-30S

**Connecting Rod Alignment Tool**
Code No.: 07909-31661
Application: Use to check the connecting rod alignment.
Applicable: Connecting rod big end I.D. range 30 to 75 mm (1.18 to 2.95 in.) dia.
Connecting rod length 65 to 300 mm (2.56 to 11.81 in.)

**Nozzle Tester**
Code No.: 07909-31361
Application: Use to check the fuel injection pressure and spray pattern of nozzle.
Measuring: 0 to 50 MPa (0 to 500 kgf/cm², 0 to 7000 psi)
**Plastigage**

Code No.: 07909-30241  
Application: Use to check the oil clearance between crankshaft and bearing, etc.  
Measuring:  
- Green .... 0.025 to 0.076 mm (0.001 to 0.003 in.)  
- Red ....... 0.051 to 0.152 mm (0.002 to 0.006 in.)  
- Blue....... 0.102 to 0.229 mm (0.004 to 0.009 in.)  

**Red Check**

Code No.: 07909-31371  
Application: Use to check cracks on cylinder head, cylinder block, etc.

**Crankshaft Nut Socket 46**

Code No.: 07916-30821  
Application: Use exclusively for removing or installing the crankshaft nut.

**Socket Wrench 46**

Code No.: 07916-30901  
Application: Use exclusively for removing or installing the crankshaft nut.

**Auxiliary Socket For Fixing Crankshaft Sleeve**

Code No.: 07916-32091  
Application: Use to fix the crankshaft sleeve of the diesel engine.
**NOTE**
- The following special tools are not provided, so make them referring to the figure.

### Valve Guide Replacing Tool

[2] SPECIAL TOOLS FOR TRACTOR

Tie-rod End Lifter
Code No.: 07909-39051
Application: Use for removing the tie-rod end with ease.
W10264720

Steering Wheel Puller
Code No.: 07916-51090
Application: Use for removing the steering wheel without damaging the steering shaft.
W10265330

Injector CH3
Code No.: 07916-52501
Application: Use for injecting calcium chloride solution into, and removing it from, rear and 4WD type front wheel tires.
W10265850

Clutch Center Tool (For B and L Series Tractors)
Application: The clutch center tool can be used for all B and L series tractors with a diaphragm clutch by changing tip guides. Center piece diameter is 20 mm (0.79 in.).
W10266370

Toe-in Gauge
Code No.: 07909-31681
Application: This allows easy measurement of toe-in for all machine models.
W10266890
Rear Axle Cover Puller
Code No.: 07916-51041
Application: Use for removing a rear axle cover from rear axle.

Relief Valve Pressure Tester
Code No.: 07916-50045
Application: This allows easy measurement of relief set pressure.

Flow Meter
Code No.: 07916-52791 (Flow Meter)
07916-52651 (Hydraulic Test Hose)
Application: This allows easy testing of hydraulic system.

Adaptor Set for Flow Meter
Code No.: 07916-54031
Application: Use for testing the hydraulic system.

Power Steering Adapter
Code No.: 07916-54021
Application: Use for measuring the relief valve setting pressure for power steering.
Pinion Locking Tool
Code No.: 07916-52311
Application: Use for preventing the shaft from turning when removing or tighten a bevel pinion shaft staking nut.
W10445520

Rear Axle Nut Wrench 71
Code No.: 07916-52531
Application: Use for removing and installing a rear axle nut.
W10446460

Relief Valve Setting Pressure Adaptor G
Code No.: 07916-52751
Application: This offers easy measurement of relief valve setting pressure from the hydraulic coupler. This is available with the relief valve setting pressure tester.
W10623960

NOTE
- The following special tools are not provided, so make them referring to the figure.

Pinion Shaft Remover
Application: Use for removing a pinion shaft.

9. TIRES

[1] TIRE PRESSURE

WARNING
- Do not attempt to mount a tire on a rim. This should be done by a qualified person with the proper equipment.
- Always maintain the correct tire pressure. Do not inflate tires above the recommended pressure shown in the operator’s manual.

IMPORTANT
- Do not use tires other than those approved by KUBOTA.

Inflation Pressure
Though the tire pressure is factory-set to the prescribed level, it naturally drops slowly in the course of time. Thus, check it everyday and inflate as necessary.

<table>
<thead>
<tr>

NOTE
- Maintain the maximum pressure in front tires, if using a front loader or when equipped with a full load of front weights.

(A) Insufficient
(B) Standard
(C) Excessive

(1) Ground
[2] TREADS ADJUSTMENT

⚠️ CAUTION

- When working on slopes or working with trailer, set the wheel tread as wide as practice for the job for maximum stability.
- Support tractor securely on stands before removing a wheel.
- Do not work under any hydraulically supported devices. They can settle, suddenly leak down, or be accidentally lowered. If necessary to work under tractor or any machine elements for servicing or adjustment, securely support them with stands or suitable blocking beforehand.
- Never operate tractor with a loose rim, wheel, or axle.

(1) Front Wheels

Front axle is not adjustable

(2) Rear Wheels

Rear tread can be adjusted in 6 steps depending on the model.

To change the tread

1. Lift the rear tires off the ground.
2. Follow the illustrations below to get the desired tread width.

⚠️ IMPORTANT

- If not attached as illustrated, transmission parts may be damaged.
- When re-fitting or adjusting a wheel, tighten the bolts to the following torques then recheck after driving the tractor 200 m (200 yards) and thereafter according to service interval.

(1) Tread

KiSC issued 02, 2007 A
[3] TIRE LIQUID INJECTION

Auxiliary weights can be used to increase traction force for plowing in fields or clayey ground.

Another way is to inject water or another liquid, such as a calcium chloride solution in the tires. Water must not be used in winter since it freezes at 0 °C (32 °F). The calcium chloride solution will not freeze and moreover, affords higher effect than water since its specific gravity is higher than that of water by about 20 %. Below is an explanation of calcium chloride solution injection.

**IMPORTANT**
- Do not fill the front tires with liquid.

### Preparation of Calcium Chloride Solution

**CAUTION**
- When making a calcium chloride solution, do not pour water over calcium chloride since this results in chemical reaction which will cause high temperature. Instead add a small amount of calcium chloride to the water at a time until the desired solution is achieved.

<table>
<thead>
<tr>
<th>Freezing temp.</th>

</tbody>
</table>

(a) Water (b) CaCl₂ (Calcium Chloride)

**Attaching Injector**

1. Lift the rear tires off the ground.
2. Turn the tire so that the air valve is at the top.
3. Remove the air valve, and attach the injector. (Code No. 07916-52501)

(1) Injector (2) Hose
Injection

**CAUTION**
- When a calcium chloride solution is used, cool it before pouring it into the tire.
- Do not fill tires with water or solution more than 75% of full capacity (to the valve stem level).

The following four ways can be used to inject water or a calcium chloride solution into tires.
1. Gravity injection (Fig. 1)
2. Pump injection (Fig. 2)
3. Pressure tank injection (Fig. 3)
4. Injection directly from tap (only when water is being used).

**NOTE**
- Once injection is completed, reset the air valve, and pump air into the tire to the specified pressure.

Weight of Calcium Chloride Solution Filling 75% of Full Capacity of a Tire

(A) Correct : 75 %
Air Compresses Like A Cushion

(B) Incorrect : 100 % Full
Water Can Not Be Compressed
Draining Water or Solution

1. Lift the rear tires off the ground.
2. Turn the tire so that the air valve is at the bottom.
3. Remove the air valve, and drain liquid (liquid can only be drained to the level of the valve and liquid under that level remains inside).
4. To drain liquid completely, use the injector, and direct compressed air into the tire to force out the liquid through the injector's vent.

(1) Injector
(2) Hose
(3) Vent

A: Compressed Air

1. FEATURES

The engine model shown in the table below is adopted in the L30 series tractor. These are 03-M series engine.

<table>

2. FUEL SYSTEM

The fuel system of this tractor is shown in the diagram above. Fuel from the tank flows in the passage as shown by the arrows, and is injected from the nozzle via the fuel injection pump. Overflow fuel returns to the tank.

The system includes filters and other concerns to protect it from entrance of air, water and dust.

While the engine is running, fuel is fed into the injection pump (6) by the fuel feed pump (8) after passing through the fuel filter (7). The fuel camshaft actuates the injection pump and force-feeds fuel to the injection nozzle (2) through the injection pipe (3). Fuel is then sprayed through the nozzle into the combustion chamber. The fuel discharged after lubricating and cooling the injection nozzle is returned to the fuel tank (4) automatically through the overflow pipe (1).
3. LUBRICATING SYSTEM

A lubricating system consists of an oil strainer (9), oil pump (8), relief valve (10), oil filter cartridge (11), oil cooler (17) and oil pressure switch (2).

The oil pump sucks lubricating oil from the oil pan through the oil strainer and the oil flows down to the oil filter cartridge where it is further filtered. Then the oil is forced to crankshaft (7), connecting rods (16), idle gear (6), governor shaft (5), camshaft (14) and rocker arm shaft (3) to lubricate each part through the oil gallery.
4. COOLING SYSTEM

The cooling system consists of a radiator (1), a centrifugal water pump (4), a cooling fan (2) and a thermostat (3). The water is cooled as it flows through the radiator core, and the cooling air through the radiator core by cooling fan (2).

The water pump receives water from the radiator or from the cylinder head and force it into the cylinder block. The thermostat (3) opens or closes according to the water temperature. When the water temperature is high, the thermostat (3) opens to allow the water to flow from the cylinder head to the radiator (1). When the water temperature is low, the thermostat close to flow the water only to the water pump (4).

The opening temperature of the thermostat (3) is approx. 71 °C (159.8 °F).

3. TIGHTENING TORQUES

Tightening torques of screws, bolts and nuts on the table below are especially specified.

(For general use screws, bolts and nuts : See page G-10.)

**NOTE**

- For * marked screws, bolts and nuts on the table, apply engine oil to their threads and seats before tightening.
- The letter “M” in Size x Pitch means that the screw, bolt or nut dimension stands for metric. The size is the nominal outside diameter in mm of the threads. The pitch is the nominal distance in mm between two threads.

4. CHECKING, DISASSEMBLING AND SERVICING

[1] SEPARATING ENGINE FROM TRACTOR

Draining Engine Oil
1. Start and warm up the engine for approx. 5 minutes.
2. Place an oil pan underneath the engine.
3. Remove the drain plugs (1) to drain oil.
4. Screw in the drain plugs (1).

(When refilling)
- Fill the engine oil up to the upper line on the dipstick (2).

■ IMPORTANT
- Never mix two different type of oil.
- Use the proper SAE Engine Oil according to ambient temperature.
  Refer to “LUBRICANTS, FUEL AND COOLANT”. (See page G-7, 8.)

<table>

(3) Oil Inlet Plug

(A) L3130, L3430, L4630, L5030
(B) L3830
(C) Oil level is acceptable within this range.
**Draining the Transmission Fluid**

1. Place oil pans underneath the transmission case.
2. Remove the drain plugs (1).
3. Drain the transmission fluid.
4. Reinstall the drain plugs (1).

**When refilling**

- Fill up from filling port after removing the filling plug (2) until reaching the upper notch on the dipstick (3).
- After running the engine for few minutes, stop it and check the oil level again, add the fluid to prescribed level if it is not correct level.

|                           |       | 9.9 Imp.gals  

**IMPORTANT**

- Use only KUBOTA SUPER UDT fluid. Use of other oils may damage the transmission or hydraulic system. Refer to “LUBRICANTS, FUEL AND COOLANT”. (See page G-7, 8.)
- Do not mix different brands of fluid together.

(1) Drain Plugs  
(2) Filling Plug  
(3) Dipstick  

(A) Oil level is acceptable within this range.
Draining Coolant

**CAUTION**
- Never remove the radiator cap until coolant temperature is well below its boiling point. Then loosen cap slightly to the stop to relieve any excess pressure before removing cap completely.

1. Stop the engine and let cool down.
2. Loosen the drain plug (3) to drain the coolant.
3. Remove the radiator cap (1) to completely drain the coolant.
4. After all coolant is drained, retighten the drain plug (3).

**(When refilling)**
- Fill the coolant between the “FULL” and “LOW” marks of recovery tank (2).

Steering Joint, Heater Hoses and Electric Wiring

1. Remove the tank frame support (2).
2. Remove the universal joint bolt (10) and steering joint support (3), and then remove the steering joint (2).
3. Disconnect the hand accelerator wire and foot accelerator wire (7). (A feet accelerator is not equipped in HST model.)
4. Disconnect the wiring connectors for engine stop solenoid (8), engine tachometer sensor (9) and glow plug.
5. Disconnect the heater hoses (4), and then reconnect their hoses to make loop. (Cabin model only.)

**NOTE**
- **Put a mark to the each heater hose before disconnecting.**

6. Disconnect the wiring connector for window washer tank (5) and compressor 1P connector (6). (Cabin model only.)
7. Disconnect the brake pedal rod.

(When reassembling)
- When accelerator wire is installed, adjust the wiring length as hit both the idling speed adjusting bolt and the maximum speed adjusting bolt by lever within the stroke of the accelerator lever.
- Set the steering joint (1) by the joint support (3) so that the steering wheel is turned lightly.
- Be sure to check and adjust the brake pedal free travel. (See page G-18.)

[A] ROPS Model  [B] Cabin Model
Clutch Rod, Brake Pedal Rod and Electric Wiring
1. Disconnect the brake pedal rod (5) and clutch rod (4).
2. Disconnect the wiring connectors for alternator (1), coolant temperature sensor (9), oil pressure switch (2), fuel unit (3), starter motor (6) and battery.
3. Remove the clamps and ground earth of wiring harness and collect wiring harness to the step or cabin.
4. Remove the clamps (7) of A/C hoses (8). (Cabin A/C model only.)

(When reassembling)
- Be sure to check and adjust the clutch and brake pedal free travel. (See page G-18, 24.)

Seat, Seat Bracket and Lever Grips
1. Remove the seat (1) with seat bracket.
2. Remove the front wheel drive lever (4).
   (Manual Transmission Model)
3. Remove the lever grip for position control lever (6), draft control lever (7), range gear shift lever (2), creep shift lever (8), main shift lever (3) and ground PTO lever (5) (if equipped).
   (GST Model)
3. Remove the lever grip for position control lever (6), draft control lever (7), GST lever (9), creep shift lever (8).
   (HST Model)
3. Remove the lever grip for position control lever (6), range gear shift lever (2) and cruise control lever (10).

Differential Lock Rod, Lowering Speed Adjusting Knob and PTO Speed Change Lever (if equipped)
1. Disconnect the differential lock rod (2).
   (Reference)
   • As for location of differential lock rod (2), it is at right side for manual transmission and GST model, and left side for HST model.
2. Remove the lowering speed adjusting knob (3).
3. Remove the PTO speed change lever (1) (if equipped).
4. Disconnect the PTO speed sensor (4) (if equipped).

A : Manual Transmission Model
B : GST Model
C : HST Model
**Electric Connector for GST**

1. Disconnect the ECU connector (1).
2. Disconnect the GST lever sensor connector (2).
3. Remove the GST valve cover.
4. Disconnect the pressure switch connector (4), proportional reducing valve connector (5), solenoid valve connector (6), oil temperature sensor connector (8) and ground cables (7).

*(Reference)*

- The ground cable (7) is at position where the manual transmission model is the same.

PTO Shift Wire, Parking Brake Cable and Connector
1. Disconnect the parking brake cable (1).
2. Disconnect the PTO shift wire (3) at the PTO clutch valve (5).
3. Disconnect the traveling speed sensor connector (2).

(When reassembling)
- Be sure to check and adjust the parking brake lever free play (see page G-27).
- When connecting the PTO shift wire (3) to the clutch valve lever, be sure to adjust the length of wire as follows.
1. Set the PTO shift lever to OFF (Neutral) position.
2. Loosen the lock nut (4) of wire, and connect wire to the clutch valve lever, and then place the wire to the hook.
3. Tighten the lock nut (4) clockwise (pull the wire), and lock the nut just before the lever moves.

Shuttle Switch Connector (Manual and GST Model)
1. Remove the panel cover and steering post cover.
2. Disconnect the shuttle switch connector (1).

Cruise Control Release Wire (HST Model)
1. Disconnect the cruise control release wire (1).

(When reassembling)
- Be sure to adjust the cruise control release wire (1). (See page 3-S92.)

Step and Floor Seat (ROPS Model)
1. Disconnect the panel frame connector (1) from fuel tank frame.
2. Remove the step and floor seat mounting bolt and nut.
3. Dismount the step, fender, floor seat and panel frame as a unit after checking whether there is forgetting to disconnect wiring.

(When reassembling)
- Be sure to set the washers and rubber plates of the floor seat and step mounting bolt at an original positions as shown in figure.
- Before mounting the floor seat and step, be sure to set both the shuttle lever rod and the shuttle arm to the neutral position, and then connect the shuttle lever rod securely. (Manual and GST model)

Propeller Shaft
1. Slide the propeller shaft cover (4) and (8) after removing the screws (7).
2. Tap out the spring pins (2), (6) and slide the couplings (1), (5) and then remove the propeller shaft with covers (4), (8).

(When reassembling)
• Apply grease to the splines of propeller shaft 1 (3).

Separating Engine and Clutch Housing
1. Place the disassembling stand under the engine and clutch housing case.
2. Remove the fuel tank support mounting screws.
3. Remove the engine and clutch housing mounting screws and nuts.
4. Separate the engine and clutch housing while lifting up the tank frame.

(When reassembling)
• Apply grease to the spline of clutch shaft.
• Apply liquid gasket (Three Bond 1211 or equivalent) to joint face of the flywheel housing and clutch housing.

**Clutch Assembly**
1. Remove the clutch from the flywheel.

*(When reassembling)*
- Direct the shorter end of the clutch disc boss toward the flywheel.
- Apply molybdenum disulphide (Three Bond 1901 or equivalent) to the splines of clutch disc boss.
- Install the pressure plate, noting the position of straight pins.

**IMPORTANT**
- Align the center of disc and flywheel by inserting the clutch center tool. (See page G-47.)

**NOTE**
- Do not allow grease and oil on the clutch disc facing.
[2] ENGINE BODY

(1) Checking and Adjusting

Compression Pressure
1. Run the engine until it is warmed up.
2. Stop the engine and disconnect the 2P connector from the stop solenoid in order to inject fuel.
3. Remove the air cleaner, the muffler and all injection nozzles.
4. Set a compression tester (Code No. 07909-30208) with the adaptor to the nozzle hole.
5. Keep the engine stop lever at “Stop Position”.
6. While cranking the engine with the starter, measure the compression pressure.
7. Repeat steps 4 through 6 for each cylinder.
8. If the measurement is below the allowable limit, apply a small amount of oil to the cylinder wall through the nozzle hole and measure the compression pressure again.
9. If the compression pressure is still less than the allowable limit, check the top clearance, valve and cylinder head.
10. If the compression pressure increases after applying oil, check the cylinder wall and piston rings.

■ NOTE
• Check the compression pressure with the specified valve clearance.
• Always use a fully charged battery for performing this test.
• Variances in cylinder compression values should be under 10 %.

<table>
<thead>
<tr>

<tr>
<td></td>
<td>512 to 583 psi</td>
<td>370 psi</td>
</tr>
</tbody>
</table>
Valve Clearance

- **IMPORTANT**
  - Valve clearance must be checked and adjusted when engine is cold.
  1. Remove the head cover, the glow plugs and the timing window cover on the clutch housing.
  2. Align the “1TC” mark line on the flywheel and center of timing window so that the No. 1 piston comes to the compression or overlap top dead center.
  3. Check the following valve clearance marked with “✩” using a feeler gauge.
  4. If the clearance is not within the factory specifications, adjust with the adjusting screw.

**NOTE**

- The “TC” marking line on the flywheel is just for No. 1 cylinder. There is no “TC” marking for the other cylinders.
- No. 1 piston comes to the T.D.C. position when the “TC” marking is aligned with center of timing window on clutch-housing. Turn the flywheel 0.26 rad (15 °) clockwise and counterclockwise to see if the piston is at the compression top dead center or the overlap position. Now referring to the table below, readjust the valve clearance. (The piston is at the compression top dead center when both the IN. and EX. valves do not move; it is at the overlap position when both the valves move.)
- Finally turn the flywheel 6.28 rad (360 °) and align the “TC” marking line and the center of timing window. Adjust all the other valve clearance as required.
- After turning the flywheel counterclockwise twice or three times, recheck the valve clearance, firmly tighten the lock nut of the adjusting screw.

W1018974
Top Clearance
1. Remove the cylinder head.
2. Move the piston up and stick a strip of fuse on the piston head at three position with grease.
3. Lower the piston and install the cylinder head. (Use a new cylinder head gasket and tighten with a specified tightening torque.)
4. Turn the flywheel until the piston passes through the T.D.C.
5. Remove the cylinder head and measure the thickness of the fuses.
6. If the measurement is not within the factory specifications, check the oil clearances between the crankpin and bearing and between the piston pin and bushing.

**Nozzle Heat Seal Service Removal Procedure**

- **IMPORTANT**
  - Use a plus (phillips head) screw driver (1) that has a Dia. which is bigger than the heat seal hole (Approx. 6 mm) 1/4 in.
  1. Drove screw drive (1) lightly into the heat seal hole.
  2. Turn screw driver three or four times each way.
  3. While turning the screw driver, slowly pull the heat seal (4) out together with the copper gasket (3).
  4. If the heat seal drops, repeat the above procedure.

(When reassembling)
- Heat seal and copper gasket must be changed when the injection nozzle is removed for cleaning or for service.

Cylinder Head
1. Loosen the pipe clamp (1), and remove the water return pipe (2).
2. Remove the cylinder head screw in the order of (r or n) to (a).
3. Lift up the cylinder head (3) to detach.
4. Remove the cylinder head gasket (4).

(When reassembling)
- Replace the cylinder head gasket with a new one.
- Tighten the cylinder head screws after applying sufficient oil.
- Tighten the cylinder head screws in diagonal sequence starting from the center in the order of (a) to (n or r).
- Tighten them uniformly, or the head may deform in the long run.

**Tappets**
1. Remove the tappets (1) from the crankcase.

(When reassembling)
- Visually check the contact between tappets and cams for proper rotation. If defect is found, replace tappets.
- Before installing the tappets, apply engine oil thinly around them.

**IMPORTANT**
- Do not change the combination of tappet and tappet guide of the crankcase.

(1) Tappet

---

**Valves**
1. Remove the valve caps (2).
2. Remove the valve spring collet (3), pushing the valve spring retainer (4) by valve spring replacer (1).
3. Remove the valve spring retainer (4), valve spring (5) and valve stem seal (6).
4. Remove the valve (7).

(When reassembling)
- Wash the valve stem and valve guide hole, and apply engine oil sufficiently.
- After installing the valve spring collets, lightly tap the stem to assure proper fit with a plastic hammer.

**IMPORTANT**
- Don’t change the combination of valve and valve guide hole.

Injection Pump
1. Remove the stop solenoid (1) and hi-idling body (2).
2. Remove the engine stop lever (3) and stop solenoid guide (5).
3. Remove the fuel injection pump assembly (4).

**IMPORTANT**
- Before removing the injection pump assembly (4), be sure to remove the stop solenoid (1), hi-idling body (2), engine stop lever (3) and stop solenoid guide (5).

**When reassembling**
- Before attaching the stop solenoid, hi-idling body and solenoid guide, install the injection pump first into position.
- Replace the hi-idling body gasket (6) with a new one.
- Before fitting the stop lever to the gear case, install the solenoid guide first into position. Then attach the stop lever and use it to see if it functions well.
- Before fitting the idling limiter in place, attach the solenoid guide and the engine stop lever in their respective positions.
- When installing the stop solenoid, be careful to keep the O-ring in place.
- Be sure to insert the push rod of the stop solenoid into the hole at the center of the solenoid guide.

Governor Springs and Speed Control Plate

**NOTE**
- Specific tool (1):
  - 1.2 mm diameter hard wire with its end hooked, overall length 200 mm (7.87 in.).
  - The tip of wire is bent like the hook to hang governor springs.

1. Remove the injection pump cover.
2. Remove the speed control plate (6) mounting nuts and bolts.
3. Using the specific tool (1), undo the large governor spring (2) from the fork lever (3).
4. Using the specific tool (1), undo the small governor spring (4) from the fork lever (3).
5. Set the speed control lever (5) as the figure.
6. Take out the speed control plate (6) with care not to let the large (2) and small (4) governor springs come off this plate and fall in to the gear case.

---

**W1148604**

2. Large Governor Spring  
3. Fork Lever  
4. Small Governor Spring  
5. Speed Control Lever  
6. Speed Control Plate
Governor Springs and Speed Control Plate (Continued)
(When reassembling)
- Hook the small spring (4) first and then the large governor spring (2) on the speed control plate (6).
- Put the specific tool (1) from the injection pump side to catch the large governor spring (2). Keep this spring slightly extended and place the speed control plate (6) in its specified position.
- Using the specific tool (1), hook the small governor spring onto the fork lever (3).

**NOTE**
- Be careful not to stretch the small governor spring (4) too long because otherwise it may get deformed permanently.
- Using the specific tool (1), hook the large governor spring (2) onto the fork lever (3).
- Make sure both the governor springs (2), (4) are tight on the fork lever (3).
- Apply and tighten up the two bolts and two nuts on the speed control plate (6).
- Check that the speed control lever (5) positions low idle, after assembling governor springs.
- Check that the speed control lever (5) returns to the high idle position rather than the low idle position, after moving the lever to the maximum speed position.
- Finally attach the injection pump cover in position.
**Fan Drive Pulley**

1. Lock the flywheel not to turn using the flywheel stopper.
2. Remove the fan drive pulley mounting nut (1).
3. Remove the fan drive pulley (2) with gear puller (3).
4. Remove the feather key.

*(When reassembling)*
- Apply grease to the splines of coupling.

**Gear Case**

1. Remove the hour meter gear case.
2. Remove the gear case (2).
3. Remove the O-rings (1).

*(When reassembling)*
- Apply liquid gasket (Three Bond 1215 or equivalent) to both side of hour meter gear case gasket.
- Check to see if there are four O-rings (1) inside the gear case (2).
- Apply a thin film of engine oil to the oil seal (3), and install it, noting the lip come off.
- Before installing the gear case gasket, apply a non-drying adhesive.

*(1) O-ring  (3) Oil Seal  (2) Gear Case*

**Crankshaft Oil Slinger**

1. Remove the feather key.
2. Remove the crankshaft collar (3).
3. Remove the O-ring (2).
4. Detach the crankshaft oil slinger (1).

*(1) Crankshaft Oil Slinger  (3) Crankshaft Collar  (2) O-ring*
Idle Gear (for D1503-M, D1703-M and D1803-M)
1. Remove the external snap ring.
2. Detach the idle gear collar.
3. Detach the idle gear (2).

(When reassembling)
- Check to see each gear is aligned with its aligning mark
  - Idle gear (2) and crank gear (4)
  - Idle gear (2) and cam gear (3)
  - Idle gear (2) and injection pump gear (1)

Idle Gear (for V2203-M and V2403-M)
1. Remove the external snap ring.
2. Detach the idle gear collar.
3. Detach the idle gear (2).

(When reassembling)
- Check to see each gear is aligned with its aligning mark:
  - Idle gear (2) and crank gear (5), cam gear (3) and balancer gear (4)
  - Cam gear (3) and idle gear (2)
  - Idle gear (2) and injection pump gear (1)
  - Idle gear (2) and balancer gear (7)

Camshaft (for D1503-M, D1703-M and D1803-M)
1. Remove the camshaft set bolts (2) and draw out the camshaft (1).

(When reassembling)
- When installing the idle gear, be sure to align the alignment marks on gears.

(C) Piston and Connecting Rod

Crank Gear
1. Draw out the crank gear (1) with a puller (2).
2. Remove the feather key.

Oil Pan and Oil Strainer
1. Remove the oil pan mounting screws.
2. Remove the oil pan (1) by lightly tapping the rim of the pan with a wooden hammer.
3. Remove the oil pan gasket (2).
4. Remove the oil strainer (3) and O-ring (4).

(When reassembling)
- After cleaning the oil strainer (3), check to see that the filter mesh is clean, and install it.
- Visually check the O-ring (4), apply engine oil, and install it.
- Securely fit the O-ring (4) to the oil strainer (3).
- Apply a liquid gasket (Three Bond 1215 or equivalent) to the oil pan side of the oil pan gasket (2).
- To avoid uneven tightening, tighten oil pan mounting screws in diagonal order from the center.
Pistons
1. Completely clean carbon (1) in the cylinders.
2. Remove the connecting rod cap (3).
3. Turn the flywheel and bring the piston to top dead center.
4. Draw out the piston upward by lightly tapping it from the bottom of the crankcase with the grip of a hammer.
5. Draw out the other piston in the same method as above.

(When reassembling)
- Before inserting piston into the cylinder, apply enough engine oil to the piston.
- When inserting the piston into the cylinder, face the mark on the connecting rod to the injection pump.

**IMPORTANT**
- Do not change the combination of cylinder and piston. Make sure of the position of each piston by marking. For example, mark “1” on the No. 1 piston.
- Place the piston rings with their gaps at 0.79 rad (45 °) from the piston pin’s direction as shown in the figure.
- Carefully insert the pistons using a piston ring compressor.
- When inserting the piston in place, be careful not to get the molybdenum disulfide coating torn off its skirt. This coating is useful in minimizing the clearance with the cylinder liner. Just after the piston pin has been press-fitted, in particular, the piston is still hot and the coating is easy to peel off. Wait until the piston cools down.

(3) Bearing Case Cover Mounting Screw (a) Upside
Crankshaft

**NOTE**
- Before disassembling, check the side clearance of crankshaft. Also check it during reassembling.

**For D1503-M, D1703-M and V2203-M**
1. Remove the main bearing case screw 2 (1).
2. Pull out the crankshaft assembly, taking care not to damage the crankshaft bearing 1 (3).

**For D1803-M**
1. Remove the main bearing case screw 2 (1).
2. Turn the crankshaft to set the crank pin of the third cylinder to the bottom dead center. Then draw out the crankshaft until the crank pin of the second cylinder comes to the center of the third cylinder.
3. Turn the crankshaft by 2.09 rad (120 °) counterclockwise to set the crank pin of the second cylinder to the bottom dead center. Draw out the crankshaft until the crank pin of the first cylinder comes to the center of the third cylinder
4. Repeat the above steps to draw out all the crankshaft.

**For V2403-M**
1. Remove the main bearing case screw 2 (1).
2. Turn the crankshaft to set the crank pin of the 4th cylinder to the horizontal directions (Right or Left). Then draw out all the crankshaft, holding the crank pins to the horizontal directions (Right or Left).

**(When reassembling)**

**IMPORTANT**
- Install the crankshaft sub assembly, aligning the screw hole of main bearing case 2 (2) with the screw hole of cylinder block.
- When tightening the main bearing case screw 2, apply oil to the screw and screw by hand before tightening the specific torque.
- If not smooth to screw by hand, align the screw holes between the cylinder block and the main bearing case.

| Tightening torque | Main bearing case screws 2 | 68.6 to 73.5 N·m
|                  |                           | 7.0 to 7.5 kgf·m
|                  |                           | 50.6 to 54.2 ft-lbs |

(2) Main Bearing Case 2
(3) Crankshaft Bearing 1

(a) Cut place for removing and installing the crankshaft

[A] D1903-M

KiSC issued 02, 2007 A
Main Bearing Case Assembly

1. Remove the two main bearing case screws 1 (8), and remove the main bearing case assembly being careful with thrust bearing and crankshaft bearing.

2. Remove the main bearing case 1, 2 as above.

(When reassembling)
- Clean the oil passage in the main bearing case.
- Apply clean engine oil on the bearings.
- Install the main bearing case assemblies in the original positions. Since diameters of main bearing cases vary, install them in order of markings (A, B for 3 cylinders and A, B, C for 4 cylinders) from the gear case side.
- Match the alignment numbers (1) and mark (2) on the main bearing case.
- When installing the main bearing case 1 and 2, face the mark “FLYWHEEL” to the flywheel.
- Install the thrust bearing with its oil groove facing (7) outward.
- Confirm that the main bearing case moves smoothly after tightening the main bearing case screw 1 (8) to the specified torque.

(3) Servicing
(A) Cylinder Head and Valves

**Cylinder Head Surface Flatness**
1. Clean the cylinder head surface.
2. Place a straightedge on the cylinder head’s four sides and two diagonal as shown in the figure.
3. Measure the clearance with a feeler gauge.
4. If the measurement exceeds the allowable limit, correct it with a surface grinder.

**IMPORTANT**
- Do not place the straightedge on the combustion chamber.
- Be sure to check the valve recessing after correcting.

<table>
<thead>

</tbody>
</table>

**Cylinder Head Flaw**
1. Prepare an air spray red check (Code No. 07909-31371).
2. Clean the surface of the cylinder head with detergent (2).
3. Spray the cylinder head surface with the red permeative liquid (1). Leave it five to ten minutes after spraying.
4. Wash away the red permeative liquid on the cylinder head surface with the detergent (2).
5. Spray the cylinder head surface with white developer (3).
6. If flawed, it can be identified as red marks.

- (1) Red Permeative Liquid
- (2) Detergent
- (3) White Developer

**Valve Recessing**
1. Clean the cylinder head surface, valve face and valve seat.
2. Insert the valve into the valve guide.
3. Measure the valve recessing with a depth gauge.
4. If the measurement exceeds the allowable limit, replace the valve.
5. If it still exceeds the allowable limit after replacing the valve, correct the valve seat face of the cylinder head with a valve seat cutter (Code No. 07909-33102) or valve seat grinder.
6. Then, correct the cylinder head surface with a surface grinder, or replace the cylinder head.

- (A) Recessing
- (B) Protrusion
Clearance between Valve Stem and Valve Guide
1. Remove carbon from the valve guide section.
2. Measure the valve stem O.D. with an outside micrometer.
3. Measure the valve guide I.D. with a small hole gauge, and calculate the clearance.
4. If the clearance exceeds the allowable limit, replace the valves.
   If it still exceeds the allowable limit, replace the valve guide.

| Clearance between valve stem and guide | Factory spec. | 0.040 to 0.070 mm  
| | | 0.00157 to 0.00276 in. |
| | Allowable limit | 0.1 mm  
| | | 0.0039 in. |

| Valve stem O.D. | Factory spec. | 7.960 to 7.975 mm  
| | | 0.31339 to 0.31398 in. |
| Valve guide I.D. | Factory spec. | 8.015 to 8.030 mm  
| | | 0.31555 to 0.31614 in. |

Replacing Valve Guide
(When removing)
1. Press out the used valve guide using a valve guide replacing tool.
(When installing)
1. Clean a new valve guide and valve guide bore, and apply engine oil to them.
3. Ream precisely the I.D. of the valve guide to the specified dimension.

| Valve guide I.D.  
| (Intake and exhaust) | Factory spec. | 8.015 to 8.030 mm  
| | | 0.31555 to 0.31614 in. |

IMPORTANT
- Do not hit the valve guide with a hammer during replacement.

(A) When Removing (B) When Installing
Valve Seating
1. Coat the valve face lightly with prussian blue and put the valve on its seat to check the contact.
2. If the valve does not seat all the way around the valve seat or the valve contact is less than 70%, correct the valve seating as follows.
3. If the valve contact does not comply with the reference value, replace the valve or correct the contact of valve seating.

   (1) Correct  (2) Incorrect  (3) Incorrect

Correcting Valve and Valve Seat

**NOTE**
- Before correcting the valve and seat, check the valve stem and the I.D. of valve guide section, and repair them if necessary.
- After correcting the valve seat, be sure to check the valve recessing.

1) Correcting Valve
1. Correct the valve with a valve refacer.

2) Correcting Valve Seat
1. Slightly correct the seat surface with a 1.047 rad (60°) (intake valve) or 0.785 rad (45°) (exhaust valve) seat cutter (Code No. 07909-33102).
2. Resurface the seat surface with a 0.523 rad (30°) valve seat cutter to intake valve seat and with a 0.262 rad (15°) valve seat cutter to exhaust valve seat so that the width is close to specified valve seat width (2.12 mm, 0.0835 in.)
3. After resurfacing the seat, inspect for even valve seating, apply a thin film of compound between the valve face and valve seat, and fit them with valve lapping tool.
4. Check the valve seating with prussian blue. The valve seating surface should show good contact all the way around.

   (a) Identical Dimensions  (A) Check Correct
   (b) Valve Seat Width  (B) Correct Seat Width
   (c) 0.523 rad (30°) or 0.262 rad (15°)  (C) Check Contact
   (d) 0.262 rad (15°) or 0.523 rad (30°)
   (e) 0.785 rad (45°) or 1.047 rad (60°)

W1028350
Valve Lapping
1. Apply compound evenly to the valve lapping surface.
2. Insert the valve into the valve guide. Lap the valve onto its seat with a valve flapper or screwdriver.
3. After lapping the valve, wash the compound away and apply oil, then repeat valve lapping with oil.
4. Apply prussian blue to the contact surface to check the seated rate. If it is less than 70%, repeat valve lapping again.

IMPORTANT
• When valve lapping is performed, be sure to check the valve recessing and adjust the valve clearance after assembling the valve.

Free Length and Tilt of Valve Spring
1. Measure the free length (A) of valve spring with vernier calipers. If the measurement is less than the allowable limit, replace it.
2. Put the valve spring on a surface plate, place a square on the side of the valve spring.
3. Check to see if the entire side is in contact with the square. Rotate the valve spring and measure the maximum tilt (B). Check the entire surface of the valve spring for scratches. If there is any defect, replace it.

**Oil Clearance between Rocker Arm and Rocker Arm Shaft**

1. Measure the rocker arm shaft O.D. with an outside micrometer.
2. Measure the rocker arm I.D. with an inside micrometer, and then calculate the oil clearance.
3. If the oil clearance exceeds the allowable limit, replace the rocker arm and measure the oil clearance again. If it still exceeds the allowable limit, replace also the rocker arm shaft.

| Oil clearance between rocker arm and rocker arm shaft | Factory spec. | 0.016 to 0.045 mm  
|                                                     |              | 0.00063 to 0.00177 in. |
|                                                     | Allowable limit | 0.10 mm  
|                                                     |              | 0.0039 in. |

| Rocker arm shaft O.D. | Factory spec. | 13.973 to 13.984 mm  
|                       |              | 0.55012 to 0.55055 in. |
| Rocker arm I.D. | Factory spec. | 14.000 to 14.018 mm  
|                      |              | 0.55118 to 0.55189 in. |

**Push Rod Alignment**

1. Place the push rod on V blocks.
2. Measure the push rod alignment.
3. If the measurement exceeds the allowable limit, replace the push rod.

| Push rod alignment | Allowable limit | 0.25 mm  
|                    |                | 0.0098 in. |

**Oil Clearance between Tappet and Tappet Guide Bore**

1. Measure the tappet O.D. with an outside micrometer.
2. Measure the I.D. of the tappet guide bore with a cylinder gauge, and calculate the oil clearance.
3. If the oil clearance exceeds the allowable limit or the tappet is damaged, replace the tappet.

| Oil Clearance between tappet and tappet guide bore | Factory spec. | 0.020 to 0.062 mm  
|                                                  |              | 0.00079 to 0.00244 in. |
|                                                  | Allowable limit | 0.07 mm  
|                                                  |              | 0.0028 in. |

| Tappet O.D. | Factory spec. | 23.959 to 23.980 mm  
|             |              | 0.94327 to 0.94410 in. |
| Tappet guide bore I.D. | Factory spec. | 24.000 to 24.021 mm  
|                         |              | 0.94488 to 0.94571 in. |
(B) Timing Gears, Camshaft and Fuel Camshaft

Timing Gear Backlash
1. Set a dial indicator (lever type) with its tip on the gear tooth.
2. Move the gear to measure the backlash, holding its mating gear.
3. If the backlash exceeds the allowable limit, check the oil clearance of the shafts and the gear.
4. If the oil clearance is proper, replace the gear.

<table>

Replacing Connecting Rod Small End Bushing

(A) (When removing)
1. Press out the small end bushing with a connecting rod small end bushing replacing tool.

(B) (When installing)
1. Clean a new small end bushing and bore, and apply engine oil to them.
2. Press fit a new bushing, taking due care to see that the connecting rod hole matches the bushing hole.

Piston Ring Gap
1. Insert the piston ring into the lower part of the liner (the least worn out part) with the piston.
2. Measure the ring gap with a feeler gauge.
3. If the gap exceeds the allowable limit, replace the ring.

|          | Allowable limit 1.25 mm 0.0492 in. |

Clearance between Piston Ring and Groove
1. Remove carbon from the ring grooves.
2. Measure the clearance between the ring and the groove with a feeler gauge.
3. If the clearance exceeds allowable limit, replace the ring since compression leak and oil shortage result.
4. If the clearance still exceeds the allowable limit after replacing the ring, replace the piston.

| Second ring | Factory spec. | D1503-M 0.093 to 0.120 mm 0.0037 to 0.0047 in. |

Connecting Rod Alignment

**NOTE**
- Since the I.D. of the connecting rod small end bushing is the basis of this check, check bushing for wear beforehand.

1. Install the piston pin into the connecting rod.
2. Install the connecting rod on the connecting rod alignment tool.
3. Put a gauge over the piston pin and move it against the face plate.
4. If the gauge does not fit squarely against the face plate, measure the space between the pin of the gauge and the face plate.
5. If the measurement exceeds the allowable limit, replace the connecting rod.

Oil Clearance between Crankpin and Crankpin Bearing

1. Clean the crankpin and crankpin bearing.
2. Put a strip of plastigage (Code No.: 07909-30241) on the center of the crankpin in each direction as shown in the figure.
3. Install the connecting rod cap and tighten the connecting rod screws to the specified torque, and remove the cap again.
4. Measure the amount of the flattening with the scale, and get the oil clearance.
5. If the oil clearance exceeds the allowable limit, replace the crankpin bearing.
6. If the same size bearing is useless because of the crankpin wear, replace it with an undersize one referring to the table and figure.

**NOTE**
- Never insert the plastigage into the crankpin oil hole.
- Be sure not to move the crankshaft while the connecting rod screws are tightened.

W1033354

W1083821
Replacing Crankshaft Sleeve
1. Remove the used crankshaft sleeve using a special-use puller set (Code No.: 07916-32091).
2. Set the sleeve guide (2) to the crankshaft.
3. Set the stopper (1) to the crankshaft as shown in figure.
4. Heat a new sleeve to a temperature between 150 to 200 °C (302 to 392 °F), and fix the sleeve to the crankshaft as shown in figure.
5. Press fit the sleeve using the auxiliary socket for pushing (4).

■ NOTE
  - Mount the sleeve with its largely chamfered surface facing outward.

(1) Stopper  (4) Auxiliary Socket for Pushing
(2) Sleeve Guide  (5) Crankshaft

Cylinder Wear
1. Measure the I.D. of the cylinder at the six positions (see figure) with a cylinder gauge to find the maximum and minimum I.D.’s.
2. Get the difference (Maximum wear) between the maximum and the minimum I.D.’s.
3. If the wear exceeds the allowable limit, bore and hone to the oversize dimension. (Refer to “Correcting Cylinder”.)
4. Visually check the cylinder wall for scratches. If deep scratches are found, the cylinder should be bores. (Refer to “Correcting Cylinder”.)

| Finishing | Hone to 2.2 to 3.0 mm μR max. |
| (0.00087 to 0.00118 in. μR max.) |

2. Replace the piston and piston rings with oversize (+0.25 mm) ones.

**NOTE**
- When the oversize cylinder is worn beyond the allowable limit, replace the cylinder block with a new one.

(1) Cylinder I.D. (Before Correction)  (2) Oversize Cylinder I.D.
# LUBRICATING SYSTEM

## Checking

1. Remove the engine oil pressure switch, and set a oil pressure tester (Code No.: 07916-32032).
2. Start the engine. After warming up, measure the oil pressure of both idling and rated speeds.
3. If the oil pressure is less than the allowable limit, check the following.
   - Engine oil insufficient.
   - Oil pump defective
   - Oil strainer clogged
   - Oil filter cartridge clogged
   - Oil gallery clogged
   - Excessive oil clearance
   - Foreign matter in the relief valve

</table>
Clearance between Rotor and Cover
1. Put a strip of plastigage (Code No.: 07909-30241) onto the rotor face with grease.
2. Install the cover and tighten the screws.
3. Remove the cover carefully, and measure the width of the press gauge with a sheet of gauge.
4. If the clearance exceeds the factory specifications, replace oil pump rotor assembly.

<table>
<thead>
<tr>
<th>End clearance between inner rotor and cover</th>
<th>Factory spec.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.105 to 0.150 mm</td>
</tr>
<tr>
<td></td>
<td>0.00413 to 0.00591 in.</td>
</tr>
</tbody>
</table>

[4] COOLING SYSTEM
(1) Checking and Adjusting

Fan Belt Tension
1. Measure the deflection (A), depressing the belt halfway between the fan drive pulley and alternator pulley at specified force (98 N, 10 kgf, 22 lbs).
2. If the measurement is not within the factory specifications, loosen the alternator mounting screws and relocate the alternator to adjust.

<table>
<thead>
<tr>
<th>Deflection (A)</th>
<th>Factory spec.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.0 to 9.0 mm</td>
</tr>
<tr>
<td></td>
<td>0.28 to 0.35 in.</td>
</tr>
</tbody>
</table>

Fan Belt Damage and Wear
1. Check the fan belt for damage.
2. If the fan belt is damaged, replace it.
3. Check if the fan belt is worn and sunk in the pulley groove.
4. If the fan belt is nearly worn out and deeply sunk in the pulley groove, replace it.
Thermostat Valve Opening Temperature

1. Suspend the thermostat in the water by a string with its end inserted between the valve and seat.
2. Heating the water gradually, read the temperature when the valve opens and leaves the string.
3. Continue heating and read the temperature when the valve opens approx. 6 mm (0.236 in.).
4. If the measurement is not within the factory specifications, replace the thermostat.

<table>
<thead>
<tr>
<th>Thermostat's valve opening temperature</th>

<td>Temperature at which thermostat completely opens</td>
<td>Factory spec.</td>
<td>85 °C</td>
<td>185 °F</td>
</tr>
</tbody>
</table>

Radiator Cap Air Leakage

⚠️ CAUTION
- When removing the radiator cap, wait at least ten minutes after the engine has stopped and cooled down. Otherwise, hot water way gush out, scalding nearby people.

1. Set a radiator tester (Code No.: 07909-31551) on the radiator cap.
2. Apply the specified pressure (88 kPa, 0.9 kgf/cm², 13 psi), and measure the time for the pressure to fall to 59 kPa (0.6 kgf/cm², 9 psi).
3. If the measurement is less than the factory specification, replace the radiator cap.

<table>
<thead>
<tr>
<th>Pressure falling time</th>
<th>Factory spec.</th>
<th>More than 10 seconds for pressure fall from 88 to 59 kPa (from 0.9 to 0.6 kgf/cm², from 13 to 9 psi)</th>
</tr>
</thead>
</table>

Radiator Water Leakage

1. Pour a specified amount of water into the radiator.
2. Set a radiator tester (Code No. 07909-31551) with an adapter (BANZAI Code No.RCT-2A-30S) and raise the water pressure to the specified pressure.
3. Check the radiator for water leaks.
4. For water leak from the pinhole, repair with the radiator cement. When water leak is excessive, replace the radiator.

<table>
<thead>
<tr>
<th>Radiator water leakage test pressure</th>

<tr>
<td></td>
<td></td>
<td>20 psi</td>
</tr>
</tbody>
</table>
[5] FUEL SYSTEM

(1) Checking and Adjusting

(A) Injection Pump

**Injection Timing**
1. Remove the stop solenoid.
2. Remove the injection pipes and nozzle.
3. Set the speed control lever to maximum fuel discharge position.

*(Reference)*
- Turn the flywheel with screwdriver.

**NOTE**
- For V2203-M and V2403-M, the pumps have a displacement angle. In adjusting the injection timing, pull the stop lever from its free position by $0.267 \pm 0.035 \text{ rad} (15.3 \pm 2 \degree)$ toward the stop position.

4. Turn the flywheel counterclockwise (facing the flywheel) until the fuel fills up to the hole of the delivery valve holder for 1st cylinder.
5. Turn the flywheel further and stop turning when the fuel begins to flow over, to get the present injection timing.

6. (The flywheel has mark 1TC and four lines indicating every 0.087 rad (5 \degree) of crank angle from 0.175 rad (10 \degree) to 0.436 rad (25 \degree) before mark 1TC) Calculate the angle which the center of the window points out. If the calculation differs from specified injection timing, add or remove the shim to adjust.

*(Injection Timing)*
0.297 to 0.331 rad (17 \degree to 19 \degree) B.T.D.C.

**NOTE**
- The sealant is applied to both sides of the soft metal gasket shim. The liquid gasket is not required for assembling.
- Shims are available in thickness of 0.20 mm, 0.25 mm and 0.30 mm. Combine these shims for adjustments.
- Addition or reduction of shim (0.05 mm, 0.0020 in.) delays or advances the injection timing by approx. 0.0087 rad (0.5 \degree).
- In disassembling and replacing, be sure to use the same number of new gasket shims with the same thickness.
(B) Injection Nozzle

CAUTION

- Check the nozzle injection pressure and condition after confirming that there is nobody standing in the direction the fume goes. If the fume from the nozzle directly contacts the human body, cells may be destroyed and blood poisoning may be caused.

Nozzle Injection Pressure

1. Set the injection nozzle to the nozzle tester.
2. Slowly move the tester handle to measure the pressure at which fuel begins jetting out from the nozzle.
3. If the measurement is not within the factory specifications, replace the injection nozzle assembly.

<table>
<thead>
<tr>
<th>Fuel injection pressure</th>
<th>Factory spec.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>13.73 to 14.71 MPa</td>
</tr>
<tr>
<td></td>
<td>140 to 150 kgf/cm²</td>
</tr>
<tr>
<td></td>
<td>1991 to 2133 psi</td>
</tr>
</tbody>
</table>

Nozzle Spraying Condition

1. Set the injection nozzle to a nozzle tester (Code No. 07909-31361), and check the nozzle spraying condition.
2. If the spraying condition is defective, replace the injection nozzle assembly.

(a) Good  (b) Bad

Valve Seat Tightness

1. Set the injection nozzle to a nozzle tester (Code No. 07909-31361).
2. Raise the fuel pressure, and keep at 12.75 MPa (130 kgf/cm², 1849 psi) for 10 seconds.
3. If any fuel leak is found, replace the injection nozzle assembly.

<table>
<thead>
<tr>

4. CHECKING, DISASSEMBLING AND SERVICING

[1] CHECKING AND ADJUSTING

Clutch Pedal Free Travel

**CAUTION**
- When checking, park the tractor on flat ground, apply the parking brake, stop the engine and remove the key.

1. Slightly depress the clutch pedal and measure free travel “L” at top of clutch pedal.
2. If the measurement is not within the factory specifications, loosen the lock nut (2), remove the clevis pin (3) adjust the length of rod (1) within acceptable limits.
3. Retighten the lock nut (2) and split the cotter pin (4).

<table>
<thead>
<tr>

(4) Cotter Pin  

L : Free Travel  

KiSC issued 02, 2007 A
[2] DISASSEMBLING AND ASSEMBLING

(1) Separating Clutch Housing and Engine

Draining the Transmission Fluid
1. Place oil pans underneath the transmission case.
2. Remove the drain plugs (1).
3. Drain the transmission fluid.
4. Reinstall the drain plugs (1).

(When refilling)
- Fill up from filling port after removing the filling plug (2) until reaching the upper notch on the dipstick (3).
- After running the engine for few minutes, stop it and check the oil level again, add the fluid to prescribed level if it is not correct level.

### Transmission Fluid capacity

<table>
<thead>
<tr>

<td>11.4 U.S.gals</td>
</tr>
<tr>
<td>Capacity</td>
<td>45 L</td>
<td>11.9 U.S.gals</td>
<td>9.9 Imp.gals</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **IMPORTANT**
  - Use only KUBOTA SUPER UDT fluid. Use of other oils may damage the transmission or hydraulic system.
  - Refer to “LUBRICANTS, FUEL AND COOLANT”. (See page G-7, 8.)
  - Do not mix different brands of fluid together.

### Transmission Fluid

- (1) Drain Plugs
- (2) Filling Plug
- (3) Dipstick

(A) Oil level is acceptable within this range.

**ROPS (Center ROPS Type)**

1. Remove the upper frame (1) from ROPS lower frame (2).
2. Disconnect the light connectors.
3. Remove the shields (3).
4. Remove the lower frames (2).

(When reassembling)

- **NOTE**
  - Do not firmly tighten all screws until most components are attached.

### Tightening torque

</table>

W1018004

KiSC issued 02, 2007 A
Battery, Front Grill, Skirt and Bonnet
1. Open the bonnet and disconnect the battery negative cable.
2. Disconnect the head light connector and remove the front grill (4).
3. Remove the left and right side skirts (3).
4. Disconnect window washer hoses (2). (Cabin model only.)
5. Remove the bonnet (1).

■ NOTE
- When disconnecting the battery cords, disconnect the negative cord first, when connecting, positive cord first.

(1) Bonnet (3) Skirt
(2) Window Washer Hose (4) Front Grill

ROPS
1. Remove the lower connector (2).
2. Remove the plate mounting screws (4), (8).
3. Remove the upper frame (1) from ROPS lower frame (5).

■ NOTE
- Do not firmly tighten all screws until most components are attached.

| Tightening torque | Lower connector mounting screw (3) | 103 to 118 N·m

Steering Joint, Heater Hoses and Electric Wiring
1. Remove the tank frame support (2).
2. Remove the universal joint bolt (10) and steering joint support (3), and then remove the steering joint (2).
3. Disconnect the hand accelerator wire and foot accelerator wire (7). (A feet accelerator is not equippeed in HST model.)
4. Disconnect the wiring connectors for engine stop solenoid (8), engine tachometer sensor (9) and glow plug.
5. Disconnect the heater hoses (4), and then reconnect their hoses to make loop. (Cabin model only.)

■ NOTE
- Put a mark to the each heater hose before disconnecting.

6. Disconnect the wiring connector for window washer tank (5) and compressor 1P connector (6). (Cabin model only.)
7. Disconnect the brake pedal rod.

(When reassembling)
- When accelerator wire is installed, adjust the wiring length as hit both the idling speed adjusting bolt and the maximum speed adjusting bolt by lever within the stroke of the accelerator lever.
- Set the steering joint (1) by the joint support (3) so that the steering wheel is turned lightly.

Clutch Rod, Brake Pedal Rod and Electric Wiring

1. Disconnect the brake pedal rod (5) and clutch rod (4).
2. Disconnect the wiring connectors for alternator (1), coolant temperature sensor (9), oil pressure switch (2), fuel unit (3), starter motor (6) and battery.
3. Remove the clamps and ground earth of wiring harness and collect wiring harness to the step or cabin.
4. Remove the clamps (7) of A/C hoses (8). (Cabin A/C model only.)

(When reassembling)
- Be sure to check and adjust the clutch and brake pedal free travel. (See page G-18, 24.)

Seat, Seat Bracket and Lever Grips
1. Remove the seat (1) with seat bracket.
2. Remove the front wheel drive lever (9).

(Manual Transmission Model)
3. Remove the lever grip for position control lever (6), draft control lever (7), range gear shift lever (2), creep shift lever (8), main shift lever (3) and ground PTO lever (5) (if equipped).

(GST Model)
3. Remove the lever grip for position control lever (6), draft control lever (7), GST lever (9), creep shift lever (8).

(HST Model)
3. Remove the lever grip for position control lever (6), range gear shift lever (2) and cruise control lever (10).

Differential Lock Rod, Lowering Speed Adjusting Knob and PTO Speed Change Lever (if equipped)
1. Disconnect the differential lock rod (2).

(Reference)
- As for location of differential lock rod (2), it is at right side for manual transmission and GST model, and left side for HST model.
2. Remove the lowering speed adjusting knob (3).
3. Remove the PTO speed change lever (1) (if equipped).
4. Disconnect the PTO speed sensor (4) (if equipped).

A : Manual Transmission Model
B : GST Model
C : HST Model

W1016574
### Electric Connector for GST

1. Disconnect the ECU connector (1).
2. Disconnect the GST lever sensor connector (2).
3. Remove the GST valve cover.
4. Disconnect the pressure switch connector (4), proportional reducing valve connector (5), solenoid valve connector (6), oil temperature sensor connector (8) and ground cables (7).

**Reference**

- The ground cable (7) is at position where the manual transmission model is the same.

### Electric Connector for HST

1. Remove the lowering speed adjusting knob (4).
2. Disconnect the differential lock rod (2).
3. Disconnect the range gear shift lever sensor connector (3).
4. Disconnect the cruise switch connector (1).
5. Disconnect the HST pedal neutral switch connector (5).
6. Disconnect the ground earth (a).

![Image](3TLABB3P253A.png)

- Cruise Switch Connector
- Differential Lock Pedal
- Range Gear Shift Lever Sensor Connector
- Lowering Speed Adjusting Knob
- HST Pedal Neutral Switch Connector
- Ground earth is connected here

W1019896

### PTO Shift Wire and Electric Connector

1. Disconnect the PTO shift wire (2) at the PTO clutch valve lever (4).
2. Disconnect the traveling speed sensor connector (1).

**When reassembling**

- When connecting the PTO shift wire (2) to the lever (4), be sure to adjust the length of wire as follows.
1. Set the PTO shift lever to OFF (Neutral) position.
2. Loosen the lock nut (3) of wire, and connect wire to the clutch valve lever (4), and then place the wire to the hook.
3. Tighten the lock nut (3) clockwise (pull the wire), and lock the nut just before the lever moves.

- Traveling Speed Sensor Connector
- Lock Nut
- PTO Clutch Valve Lever

W1020066

KiSC issued 02, 2007 A
Shuttle Switch Connector (Manual and GST Model)
1. Remove the panel cover and steering post cover.
2. Disconnect the shuttle switch connector (1).

(1) Shuttle Switch Connector

Cruise Control Release Wire (HST Model)
1. Disconnect the cruise control release wire (1).

(When reassembling)
- Be sure to adjust the cruise control release wire (1). (See page 3-S92.)

(1) Cruise Control Release Wire

Step and Floor Seat (ROPS Model)
1. Disconnect the panel frame connector (1) from fuel tank frame.
2. Remove the step and floor seat mounting bolt and nut.
3. Dismount the step, fender, floor seat and panel frame as a unit after checking whether there is forgetting to disconnect wiring.

(When reassembling)
- Be sure to set the washers and rubber plates of the floor seat and step mounting bolt at an original positions as shown in figure.
- Before mounting the floor seat and step, be sure to set both the shuttle lever rod and the shuttle arm to the neutral position, and then connect the shuttle lever rod securely. (Manual and GST model)

Cabin Assembly
1. Remove the outer roof of cabin.
2. Support the cabin with nylon straps (1) and hoists.
3. Loosen and remove the cabin mounting bolts (2) and nuts (9).
4. Dismounting the cabin from tractor body.

**NOTE**
- Lift the cabin while making sure it does not catch on anything.

(When reassembling)
- Be sure to install the washers and mount rubbers, etc. in their original positions.
- Before mounting the cabin, be sure to set both the shuttle lever rod and the shuttle arm to the neutral position, and then connect the shuttle lever rod securely. (GST model)

(2) Removing Clutch Assembly

Clutch Assembly

1. Remove the clutch from the flywheel.

*(When reassembling)*
- Direct the shorter end of the clutch disc boss toward the flywheel.
- Apply molybdenum disulphide (Three Bond 1901 or equivalent) to the splines of clutch disc boss.
- Install the pressure plate, noting the position of straight pins.

**IMPORTANT**
- Align the center of disc and flywheel by inserting the clutch center tool. *(See page G-47.)*

**NOTE**
- Do not allow grease and oil on the clutch disc facing.

[3] SERVICING

Backlash between Clutch Disc Boss and Gear Shaft
1. Mount the clutch disc to the gear shaft.
2. Hold the gear shaft so that it may not turn.
3. Rotate disc lightly and measure the displacement around the disc edge.
4. If the measurement exceeds the allowable limit, replace the disc.

<table>
<thead>
<tr>
<th>Displacement around disc edge</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2.0 mm</td>
</tr>
<tr>
<td></td>
<td>0.079 in.</td>
</tr>
</tbody>
</table>

Thrust Ball Bearing
1. Remove the thrust ball bearing from release hub with a puller.
2. Check for abnormal wear on contact surface.
3. Hold bearing inner race and rotate outer race, while applying pressure to it.
4. If the bearing rotation is rough or noisy, replace the bearing.

■ NOTE
- Do not depress outer race, while installing thrust ball bearing

Clutch Disc Wear
1. Measure the depth from clutch disc surface to the top of rivet at least 10 points with a depth gauge.
2. If the depth is less than the allowable limit, replace the disc.
3. If oil is sticking to clutch disc, or disc surface is carbonized, replace the disc.
   In this case, inspect transmission gear shaft oil seal, engine rear oil seal and other points for oil leakage.

</tbody>
</table>
Checking Pressure Plate Assembly and Flywheel

1. Wash the disassembling parts except clutch disc with a suitable cleaning solvent to remove dirt and grease before making inspection and adjustment.

2. Check friction surface of pressure plate and flywheel for scoring or roughness.  
   - Slight roughness may be smoothed by using fine emery cloth.  
   - If these parts have deep scores or grooves on their surface, they should be replaced.

3. Check the surface of the diaphragm spring for wear.  
   If excessive wear is found, replace clutch cover assembly.

4. Inspect thrust rings (wire ring) for wear or damage. As these parts are invisible from outside, shake pressure plate assembly up and down to listen for chattering noise, or lightly hammer on rivets for a slightly cracked noise. Any of these noises indicates need of replace as a complete assembly.

<table>
<thead>
<tr>
<th>Diaphragm spring mutual difference</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.5 mm 0.020 in.</td>
</tr>
</tbody>
</table>

Pressure Plate Flatness

1. Place a straight edge on the pressure plate and measure clearance with a feeler gauge at several points.

2. If the clearance exceeds the allowable limit, replace it.

3. When the pressure plate is worn around its outside and its inside surface only is in contact with the straight edge, replace even if the clearance is within the allowable limit.

<table>

7. Ground PTO Gear Shift Section
[2] POWER TRAIN FOR TRAVELING GEAR

The transmission consists of a series of gears and shafts as shown in previous page.

The traveling system consists of main gear shift section, shuttle shift section, range gear shift section and front wheel drive section.

(1) Main Gear Shift Section

The main gear shift section is located in the clutch housing, and it uses a synchromesh.

Power which is transmitted from the engine to the gear shaft (1) via the clutch is changed in four ways by operating the main shift lever to shift the shifters, and transmits to the counter shaft (3).

(2) Shuttle Shift Section

The shuttle shift section is located in the mid case, and it uses a double cone type synchromesh. It allows the operator to change forward and reverse for each speed from the first to eight with single shift lever.

The double cone type synchromesh is characterized by its light operating force and durability because it engages with the gear in reverse rotation when the speed is changed from forward to reverse position or vice versa.

Two synchronizing rings (7), (9) are installed on one side, and the center ring (8) is provided between the synchronizing rings. This construction doubles the ground contact area of the synchronizer rings (7), (9) and improves the durability as compared with the ordinary key type synchromesh.

(12) Hub

F : Forward
R : Reverse
(3) **Range Gear Shift Section**

The range gear shift section is located in the differential gear case, and it uses constant mesh.

1. Shuttle Gear Shaft
2. Gear for Low
3. Shifter
4. Gear for High
5. Range Gear Shaft
6. Counter Gear
7. Spiral Bevel Pinion

L: Low Speed
H: High Speed

(4) **Front Wheel Drive Section**

Front wheel drive shift section is located in the differential gear case. 2 wheel drive or 4 wheel drive is selected by operating the front wheel drive lever to shift the shifter gear (4).

1. Spiral Bevel Pinion
2. Gear
3. Front Wheel Drive Gear
4. Shifter Gear
5. Front Wheel Drive Shaft (Connected to Propeller Shaft)

a: 4 Wheel Drive Position
(5) Creep Gear Shift Section

The creep speed section is located under the N-C range gear shift section to reduce a travelling speed. It is shifted by the creep shift lever to shift the shifter (3).

The power train of creep speed is as shown in figure.

- (1) Creep Output Gear
- (2) Range Gear Shaft
- (3) Shifter
- (4) Low Speed Counter Gear
- (5) Spiral Bevel Pinion Shaft
- (6) Creep Gear Shaft
- (7) Creep Gear

W1021456

[3] SHIFT LINKAGE MECHANISM

(1) Main Gear Shift Lever

The links are connected from the shift lever (6) to the shift forks (1), (2) as shown in the figure. Each speed from the 1st to 4th can be changed by a single shift lever (6).

When the shift lever (6) is moved to the left, the shift arm (3) is engaged with the 1-2 shift fork (1), allowing the operator to change the 1st or the 2nd speed.

When the shift lever (6) is moved to the right, the shift arm (3) is engaged with the 3-4 shift fork (2), allowing the operator to change the 3rd or the 4th speed.

- (1) 1-2 Shift Fork
- (2) 3-4 Shift Fork
- (3) Shift Arm
- (4) Shift Rod 1
- (5) Shift Rod 2
- (6) Main Gear Shift Lever

R : Right Movement
L : Left Movement
1 : 1st Shift
2 : 2nd Shift
3 : 3rd Shift
4 : 4th Shift

W1013619
(2) Shuttle Shift Lever

The links are connected from the shift lever (1) to the shift fork (7) as shown in the figure.
When the shift lever (1) is moved to the F side, the shift fork (7) is moved toward the F side, allowing the operator to shift to forward by means of the shuttle universal joint (2), shuttle shift shaft (3), shift arm (6), and shuttle fork rod (5).
When the shift lever (1) is moved to the R side, the shift fork (7) is shifted to reverse position.

(3) Range Gear Shift Lever

The links from the shift lever (1) to the shift fork (5) are connected as shown in the figure.
When the shift lever (1) is moved to the A side, the shift fork (5) is moved to the A side by means of the rod (2), sub-arm (3), and shift arm (4), changing the shift arm to the Lo-speed side. When the shift lever (1) is moved to the B side, the shift fork (5) is moved to the Hi-speed side.

(4) Front Wheel Drive Lever

The shift lever (1) is connected directly to the shift fork (2).
When the shift lever (1) is moved to the A side, the shift fork (2) is also moved to the A side, then the front wheel drive is “Engaged”.
When the shift lever (1) is moved to the B side, the front wheel drive is “Disengaged”.

KiSC issued 02, 2007 A
(5) Creep Gear Shift Lever

The links are connected from the shift lever (3) to the shift fork (1) as shown in the left figure.

When the shift lever (3) is moved to the A side, the shift fork (1) is moved to the A side by means of the rod (4), sub-arm (5), and shift arm (2), thereby causing the creep shift.

When the shift lever (3) is moved to the B side, the shift fork (1) is moved to the B side to cause the normal shift.

(1) Shift Fork  A : Creep Speed Shift
(2) Shift Arm   B : Normal Speed Shift

[1] STRUCTURE

(1) Main Gear Shift Section
(2) Clutch Pack for GST
(3) PTO Clutch Section
(4) Shuttle Shift Section
(5) Range Gear Shift Section
(6) Front Wheel Drive Shift Section

KiSC issued 02, 2007 A
The GST of a new version is adapted in the L30 series tractor. In addition to the former GST system that controls the gear shifting and clutch operation hydraulically, this new GST has the function to control these operations electrically.

12 forward and 8 reverse speeds can shift only by operating the main shift lever (GST lever) (4) and shuttle shift lever (3) without the clutch operation as well as the former GST system. In addition, the movement and gear shifting according to the oil temperature and the traveling speed can be achieved by having electronically controlled the GST system, and a smoother operation can be done.

Moreover, because the selected speed and the traveling speed can be confirmed by the liquid crystal display (LCD) (1) of electronic instrument panel (IntelliPanel) (2), it can do a comfortable tractor operation. And it is excellent in service because it can confirm the error indication with an electronic instrument panel (2) when the electric wiring is disconnected or short-circuited.

(1) Liquid Crystal Display (LCD) (2) Electronic Instrument Panel (IntelliPanel) (3) Shuttle Lever (4) Main Shift Lever (GST Lever)
The transmission is composed of the fully synchronized gear shifting and the hydraulic clutch as shown above figure. And the double cone type synchromesh is adapted on the 4th speed side of main shift section (1), shuttle shift section (4) and L side of main range shift section (5).

As for the speed changing, only by operating the GST lever, the shifter of the gear changing is moved by hydraulic operation which is electrically controlled. And as for each gear changing, each shift is moved according to the shift pattern input to the electric control unit (ECU). The shift pattern is shown in the table below.

Regarding a double cone type synchromesh system and front wheel drive section, these are basically similar to manual transmission model and refer to page 3-M3 and 3-M4.

[4] ELECTRICAL CONTROL SYSTEM

**NOTE**

- Only the electrical control system concerning the GST operation has been described in this section. Therefore, refer to “ELECTRICAL SYSTEM” section (Section 9) for a general electrical control system.

(1) Construction and Function of Components

The electric control of the GST system is composed by parts shown in the above figure.

**Electric Control Unit (ECU)**

This unit incorporates an electronic circuit for various control of GST system and it is equipped on the left under of the platform.

The ECU processes and judges the input data from various switches and sensors and send the signal to various solenoid valves (solenoid valves and proportional reducing valve). At the same time, it also sends the communication data to display the selected-speed and several messages in electronic instrument panel.

(1) Electric Control Unit
Electronic Instrument Panel (IntelliPanel)

The 8 bits CPU is built into this panel. The electronic instrument panel has functions to receive several data of GST control from the ECU, and output them to the liquid crystal display and the monitor lamps. Moreover, it transmits the model data and the sensor data, etc. also to the ECU.

GST Lever Sensor

This sensor has function to detect the GST lever position, and it is equipped on the bottom of the GST lever (2).

This sensor is a variable resistor of the rotation displacement type, and all resistance is 2 kΩ, and electrically effective angle is 140 degrees. Then, the lever position from N to 12 speed is output within the range from about 0.7 to 4.2 voltages.

Shuttle Switch

This switch has function to detect the shuttle lever position, and it is equipped on the bottom of the shuttle lever rod (2).

This switch has three contact points, which is Forward, Neutral and Reverse, and detects their position. As for GST control, it judges the shuttle start condition.

Engine Tachometer Sensor

This sensor is to detect the engine rotating speed, and it is equipped on the left side of the engine gear case. This sensor perceives tooth of the fuel camshaft gear and emits the pulse. This pulse is sent to the electronic instrument panel, and converted at the engine speed. The data of engine speed is always sent to the ECU.
■ Pressure Switch
This switch is to detect the gear change completion and hydraulic clutch operation, and it is equipped on the GST valve.
This switch is turned ON when the pressure in the GST valve becomes higher than 0.49 MPa (5 kgf/cm², 71 psi) of the pilot pressure, and it is turned OFF at a pressure lower than 0.34 MPa (3.5 kgf/cm², 50 psi).

(1) Pressure Switch

W1015998

■ Oil Temperature Sensor
This sensor is to detect the temperature of transmission fluid, and it is equipped on the GST valve.
This is provided to make correction for driving time and current of proportional reducing valve in accordance with the oil temperature. This is used to thermistor, and it has such characteristics that its resistance decreases at high temperature and increases at low temperature.

(1) Oil Temperature Sensor

W1016064

■ Traveling Speed Sensor
This sensor is to detect the traveling speed, and it is equipped on the right bottom side of the differential case. This sensor perceives tooth of the front wheel drive gear (3) on the PTO drive shaft (2) and emits pulse. This pulse is sent to the electronic instrument panel, and the traveling speed is calculated by the coefficient which is set according to the tire size. The data of traveling speed is always sent to the ECU.

(1) Traveling Speed Sensor  (3) Front Wheel Drive Gear
(2) PTO Drive Shaft

W1015587
(2) Electrical Control

An electrical control of GST system is as follows.

1. Shift the GST lever and shuttle lever to desired position.
2. The output voltage of selected gear shift position is output to microcomputer of the ECU by lever sensor.
3. The ECU detects the gear shift position with GST lever sensor and shuttle switch, and excites various solenoid valves in accordance with selected position.
4. When the desired solenoid is excited, oil is sent to the desired shift piston.
5. A pressure in the circuit is raised because the movement of shift piston shuts the shift check pin. When the pressure in the circuit reaches 0.49 MPa (5 kgf/cm², 71 psi), the pressure switch becomes ON.
6. By means of the pressure switch's ON, the ECU detects the present condition (traveling speed, engine speed and oil temperature) from various sensors, and pressure in the hydraulic clutch is raised according to the respective condition.

**NOTE**
- By means of speed increasing, speed decreasing, traveling speed, engine speed and oil temperature, the indicated pressure period from c to d is controlled at appropriate pressure respectively.

7. A pressurizing to hydraulic clutch has been done until it reaches the system pressure, and pressure in the clutch is maintained at this state.

1. Oil is supplied from the power steering hydraulic pump (2) while running the engine.
2. The oil entering the regulating valve assembly (1) flows through the pressure reducing valve (5) to the GST circuit. This oil pressure is maintained at a fixed level by the pressure reducing valve (5).
3. When the GST lever is operated, the desired shift solenoids (8), (9), (10), (11), (14) or (16) are excited according to the output voltage from the GST lever sensor.
4. When the solenoid valve is operated, oil is supplied to corresponded shift pistons (12), (13), (15) or (17), and the shift piston is moved. The shift arm that is moved by the shift piston moves shifter of synchromesh to shift the gear. At this time, GST clutch (27) has been disengaging until gear shifting is completed.
The GST clutch (27) is engaging except where the condition is neutral, is gear shifting and is engine stopping.
5. Pressure in the pilot circuit rises because the shift check valves (18), (21) and (19) or (20) are shut by the movements of shift pistons at the same time as completing gear shifting.
6. By means of pressure rising of the circuit, the clutch valve (24) is actuated. And, oil flows through the low-pass valve (25) and the proportional reducing valve (26) to the GST clutch (27). This oil flows until becoming the compound pressure which is both of setting pressure for closing of low-pass valve, and controlled indication pressure of the proportional reducing valve.

(Reference)
- Setting pressure for closing of low-pass valve: 0.24 MPa (2.5 kgf/cm², 34.1 psi)
7. Because pressure in the GST clutch (27) is gradually pressurized by function of proportional reducing valve (26), clutch is able to engage without shock and smoothly.
8. When the pressure in the circuit rises to the system pressure, pressure is maintained. And the GST clutch is maintained at engaging condition until the next gear shifting.

(2) Construction and Function of Components

(A) Regulating Valve

The oil from the hydraulic pump for the power steering system flows to the GST circuit to set the pressure of the circuit. Other oil flows to the power steering circuit.

The oil from the power steering hydraulic pump (2) flows through the pressure reducing valve (5) to the GST circuit. When the oil is filled into the circuit, the pressure reducing valve (5) is closed to maintain the pressure in the GST system circuit to 2.45 MPa (25.0 kgf/cm², 356 psi).

The oil from the power steering pump passes through the regulating valve (3) and check valve (4), and then it flows to power steering circuit. The regulating valve (3) is provided to maintain 2.94 MPa (30.0 kgf/cm², 427 psi) at inlet pressure of the pressure reducing valve (5) except when the power steering is operated. Thereby getting 2.45 MPa (25.0 kgf/cm², 356 psi) of the GST circuit pressure.

### GST Valve Assembly

The GST valve assembly is installed at the left side of the transmission mid case. In the GST valve assembly, many parts comprising the system are installed, including the solenoid valves, shift pistons, shift check valves, low-pass valve, proportional reducing valve, clutch valve, check valves, sensor and switches. The GST valve assembly functions as the central unit of the GST system.

---

### Solenoid Valve

When the GST lever is operated, the solenoid valve controls the flow of oil according to the gear shifting operation.

When the solenoid is not excited, oil from regulating valve flows to the shift piston through the surrounding of the ball (10) in the valve. When the solenoid is excited, plunger (9) presses the ball against the valve seat (11) to open the unload passage (12), and drain the oil.

10. Ball
11. Valve Seat
12. Unload Passage

T : Drain Port
R : IN Port
P : To Shift Piston
■ Shift Piston

The shift pistons (1), (2), (3), (4) are actuated by the oil distributed by the each solenoid valve. At the tip of these shift pistons (1), (2), (3) are installed the shifters (5), which are connected to each shift rod and shift the gear.

There are neutral positions in 1-2 shift piston (2) and 3-4 shift piston (1).

(A)

(B)

KiSC issued 02, 2007 A
### Shift Check Valve

The shift check valves (2), (3), (4), (5), (6) are provided on each shift piston and the shuttle shift rod.

From the start to the end of gear shifting, the shift check valves (2), (4), (5), (6) of the shift pistons are opened because the ball (9) of the check pin (18) is on the straight portion, the oil in the pilot circuit of the clutch valve passes through the shift check valves (2), (3), (4), (5), (6) to be drained into the tank, causing the GST clutch to be disengaged.

When the gear shifting is completed, the ball (9) of the check pin (18) enters the groove of the shift piston; the check valve is closed, causing the pilot circuit pressure to rise and the clutch valve to open. Thus, the oil flows into the GST clutch to engage it. The 1-2 shift check valve (6) and 3-4 shift check valve (5) compose a serial circuit. When either valve is closed, the oil in the pilot circuit will not be drained into the tank.

In case of the shuttle shifting, the shift check valve (3) is opened and closed by the groove of the shuttle shift rod.

Note that the shuttle shift fork rod has a slot into which the shift fork mounting bolt is inserted. Therefore, when the shuttle shift lever is moved, the shuttle shift fork rod is moved before the shuttle shift fork is moved, disengaging the clutch pack and thus moving the shuttle shift fork.
- **Low-pass Valve**

After completion of the gear shifting, the low-pass valve (8) opens immediately to flow oil into the GST clutch (9), to promote the engagement of the clutch.

When the gear shifting starts, the oil in the GST clutch (9) passes the clutch valve (7) to be drained into the tank. So prior to beginning of the GST clutch connection and after completion of gear shifting, it is necessary to flow oil to the GST clutch quickly. It is the low-pass valve that does this operation with the proportional reducing valve (10) simultaneously.

The oil from the regulating valve flows in from the **IN-port (A)**, passes through the low-pass valve poppet (4), flows out from **OUT-port (B)**, and flows to the clutch valve (7) and clutch (9). When the pressure on the side of the **OUT-port (B)** reaches setting pressure, the poppet (4) pushes the spring (3) to close the circuit.

- **Proportional Reducing Valve**

  After the gear shifting is completed, this valve has function which gradually rises the pressure in the clutch (4) in order to make a clutch engaging for without shock and smoothly.

  When the gear shifting is completed, the pressure switch is turned **ON**. By means of turning on the pressure switch, the microcomputer of ECU calculates and judges the charging of pressure and its time according to the oil temperature sensor and gear shifting period, and the traveling speed and speed acceleration according to the traveling speed sensor. By these instructions from microcomputer of ECU, the proportional reducing valve adjusts pressure in the clutch to become a appropriate acceleration.

\[ T : \text{DRAIN Port (To Tank)} \]

W1021268
■ Clutch Valve

The clutch valve (5) changes the flow of the oil flowing to the GST clutch to carry out “ENGAGE” / “DISENGAGED” of the clutch.

Except for during gear shifting, the oil of the pilot circuit flows in from the A-port to push the spool to the right when the pilot circuit is pressurized. Therefore, the oil from the low-pass valve (7) and proportional reducing valve (8) flows in from B and C-port, flows out from the D-port, and flows to the GST clutch (6).

When the pilot circuit pressure is zero, that is, from the start to the left with the spring (3) to cut the oil flow of B and C-port, and stopping the oil flow to the GST clutch (6). Furthermore, the oil of the GST clutch flows in from D-port, and is drained from E-port, and then the GST clutch is disengaged.

(1) Plug
(2) Spool
(3) Spring
(4) Stopper Plate
(5) Clutch Valve

A : A-Port (From Pilot Circuit)
B : B-Port (From Low-pass Valve)
C : C-Port (From Proportional Reducing Valve)
D : D-Port (To GST Clutch)
E : E-Port (To Tank)
The GST clutch is hydraulic multiple plate type and is provided between the counter shaft (3) and the shuttle shaft (8), and it “engages” and “disengages” the power from the engine. This is controlled by the operation of clutch valve (2).

- **Engaging (When the shift gear is at desired position while engine is running)**
  The oil from clutch valve (2) flows in to push the return spring (9) and the piston (6). The piston is pushed to the left by the oil, thereby pushing the clutch discs (4) and the plates (5) to transmit the power.

- **Disengaging (When the engine stop, the shift levers are neutral position, between from start to end of the gear shifting)**
  The oil of the GST clutch (1) is pushed out with return spring (9) and piston (6), and flowed to the tank.

### [6] SHIFT LINKAGE MECHANISM

For shift linkage mechanism of “Shuttle Lever” and “Front Wheel Drive Lever”, refer to page 3-M6.
3. HYDROSTATIC TRANSMISSION (HST) MODEL

[1] STRUCTURE

1. Hydrostatic Transmission Section
2. PTO Clutch Section
3. Range Gear Shift Section
4. Front Wheel Drive Shift Section
[2] POWER TRAIN

The transmission of this model consists of a series of gears and shafts as shown in previous page. The traveling system is chiefly composed of hydrostatic transmission section, range gear shift section and front wheel drive section.

(1) Hydrostatic Transmission (HST)

(A) Structure

The HST of L30 series tractor is a built-in type to the clutch housing, and HST with the servomechanism is adapted. The servomechanism controls the pedal operation of HST hydraulically. As a result, the HST pedal feels extremely light and smoother pedal operation can be done.

HST assembly is chiefly composed of HST case (clutch housing), variable displacement piston pump, fixed displacement piston motor, charge pump, servo-regulator and various valves. Refer to the next page for detailed parts in the HST.

(16) Check and High Pressure Relief Valve
(17) Charge Relief Valve

A : Sectional View W-W
B : Sectional View X-X
C : Sectional View Y-Y
D : Sectional View Z-Z
(B) Oil Flow

Oil flows in HST case from a-port, and is sent to b-port with the charge pump (15). Oil from b-port is sent to the HST circuit and the PTO clutch circuit through the filter (7). Moreover, the oil of the HST circuit sent to c-port is flowed into the servo regulator (2) and HST main circuit. At this time, the pressure in the regulator, HST main circuit (closed circuit) and PTO clutch circuit is controlled with the charge relief valve (6). The oil in regulator is used for the movement of servo piston (13) which is operated by the regulator valve (3) and HST pedal (4). And the oil in the HST main circuit gets circulated between the variable displacement piston pump (12) and the fixed displacement piston motor (16), which forms a closed circuit.

On the other hand, surplus oil with the charge relief valve (6) flows out from d-port, and is sent to the suction line through the oil cooler (10). And the case relief valve (5) controls pressure in the HST case.

(Reference)
- Valve Setting Pressure [Oil temperature : 40 to 60 °C (104 to 140 °F)]
  - Charge Relief Valve : 2.25 to 2.45 MPa (23 to 25 kgf/cm², 327 to 355 psi)
  - Check and High Pressure Relief Valve : 33.3 to 36.3 MPa (340 to 370 kgf/cm², 4836 to 5262 psi)
  - Case Relief Valve : 0.29 MPa (3.0 kgf/cm², 42.7 psi)
(C) Function of Components

■ Servomechanism

As for the servomechanism, the regulator (2) and servo piston (6) are chiefly composed. The regulator is connected to the HST pedal through linkages, and controls the flow of oil to the servo piston by the pedal operation. The servo piston moved by hydraulic force, is connected to the pump cylinder swashplate. Therefore, a tilt angle of swashplate is varied by servo piston movement.

As for the regulator and the servo piston, it is connected with feedback lever (4), and the movement of the piston is restricted according to the amount of depressing of the HST pedal.

Refer to Workshop Manual of “TRACTOR MECHANISM” (Code No. 97897-18200) for the operation of the servomechanism, that is, the operation of regulator and servo piston.

■ Valves

As for the mechanism and function of check and high pressure relief valve, charge relief valve and case relief valve, refer to Workshop Manual of “TRACTOR MECHANISM” (Code No. 97897-18200).
(D) Operation

■ Neutral

The sucked oil from the transmission case (1) by the charge pump (4) flows into the HST housing (13) and regulator valve (7) through the oil filter (16) and charge relief valve (18). Overflow oil from HST housing (13) flows to the suction line through the oil cooler (15).

When the HST pedal (10) is in neutral, regulator valve (7) is not activated, so the variable swashplate (6) is at right angle to the pump pistons and they only rotate with cylinder (5) without reciprocation. Since the oil is not being pumped to motor, the cylinder block in the motor (20) is stationary and the output shaft (21) does not rotate.
When the HST pedal (10) is stepped on and in forward, so the variable swashplate (6) is tilted by the servo piston (8) and regulator valve (11) as shown in figure above.

As the pump cylinder block (5) rotates with the input shaft (3), oil is forced out of pump port A at high pressure. As pressure oil enters motor port D, the pistons, which align with port D, are pushed against the thrust plate and slide down inclined surface.

Then the output shaft (21) rotates with the motor cylinder block (20). This drives the machine forward and the angle of pump swashplate determines the output shaft speed.

As the motor cylinder block continues to rotate, oil is forced out of motor port C at low pressure and returns to the pump port B.
When the HST pedal (10) is stepped on and in reverse, the variable swashplate (6) is tilted by servo piston (8) and regulator valve (11) as shown in figure above.

As the pump cylinder block (5) rotates with the input shaft (3), oil is forced out of pump port B at high pressure. As pressure oil enters motor port C, the pistons, which align with port C, are pushed against the thrust plate and slide down inclined surface.

Then the output shaft (21) rotates with the motor cylinder block (20). This drives the machine rearward and the angle of pump swashplate determines the output shaft speed.

As the motor cylinder block continues to rotate, oil is forced out of motor port D at low pressure and returns to the pump port A.
The speed control pedal (HST pedal) (4) and the HST control lever (servo control lever) (2) are linked with the pedal bracket (5) and HST control rod (3). And HST pedal (4) and the neutral holder arm (10) are linked with pedal bracket (5) and neutral rod (7) through connecting shaft (6).

As the HST pedal (4) is depressed to forward, the HST control lever (2) is rotated, then the swashplate is tilted by servomechanism and forward travelling speed increases. Then, the swashplate is returned to neutral with the neutral holder arm (10), when the pedal is released. The ball bearing (9) on the neutral holder (8) pulled with the neutral spring (11) seats the detent of the neutral holder arm (10) so that the neutral holder arm returns to neutral.

The damper (12) is connected to the HST pedal (4) through connecting shaft (6), neutral rod (7) and neutral holder arm (10), restricts the movement of the linkage to prevent abrupt operation or reversing.
(F) Cruise Control

■ Speed Set

The cruise control lever (8) and HST pedal (1) are linked with the lever rod (7), cruise lever 1 (9), cruise lever 2 (6), cruise adjusting rod (10) and connecting shaft (11).

When the cruise control lever (8) is moved to forward direction, cruise lever 2 (6) is moved to arrow direction by the lever rod (7). The cruise lever 1 (9) is moved forward by being pushed to the cruise lever 2 (6), and cruise adjusting rod (10) is pulled backward. Because cruise adjusting rod (10) and the HST pedal (1) are connected by the connecting shaft (11), the HST pedal is moved and HST becomes forward position.

On the other hand, because the plate (4) and the rubber (5) are suppressed outside by the release lever (2) and the cruise spring (3), cruise lever 1 (9) and cruise lever 2 (6) are fixed at the position. As a result, cruise control lever position can be infinitely set.

In addition, because the movement of the cruise lever 1 (9) is restricted by the cruise lever 2 (6), the backward pedal operation cannot be done while the cruise control lever (8) is operating.
Release

The cruise control can be returned to neutral automatically when brake pedals (1) are depressed. When brake pedals (1) are depressed, brake lever (2) is pulled by release lever (4) via release wire (10). The release lever (4) is moved along grooves (12). As a result, the holding force of cruise control lever (8) is lost and the cruise control lever (8) returns to neutrality by force of the release spring (5).

**NOTE**
- The cruise control will release when both brake pedals are depressed.
- The cruise control does not release when the individual right or left brake is applied.
(2) Range Gear Shift Section

The range gear shift section is located in the differential gear case. It changes the speed to five positions (L, N, M, N and H) by shifting of shifter gear (3) in the straight line on bevel pinion shaft (7).

(1) Counter Shaft
(2) Gear (for L)

[2] **PTO CLUTCH**

(1) **Shift Linkage**

The shift lever (1) and the PTO clutch valve (4) are connected by the shift cable (3) as shown in the left figure.

When the shift lever is moved to the B side, the PTO clutch valve (4) is set at “ENGAGED” position. Then the oil flows to clutch pack through the PTO clutch valve (4), and the clutch pack is engaged and the PTO shaft rotates. When the shift lever is moved to the A side, the PTO clutch valve (4) is set at the “DISENGAGED” position.

(1) Shift Lever  (2) Lever Guide  (3) Shift Cable  (4) PTO Clutch Valve

W1025261

(2) **Oil Flow**

Oil flows into the clutch valve (2) after it is regulated to the system pressure. As for the system pressure of the PTO clutch valve, it is controlled by the regulating valve for GST and Manual Transmission model, and it is controlled by the HST charge relief valve for HST model. When the PTO lever is at the “DISENGAGED” position, the oil does not flow through the PTO clutch valve (2) to the clutch pack. When the PTO lever is at the “ENGAGED” position, the oil flows through the PTO clutch valve (2) to the accumulator (4) and the PTO clutch pack (3) to engage it.

(1) Check Valve (Except HST Model)  (2) PTO Clutch Valve  (3) PTO Clutch Pack  (4) Accumulator

A : From Regulating Valve (For Manual Transmission and GST Model)
From HST Charge Pump (For HST Model)
B : Pressure Check Port

W1025366
(3) Operation

The oil flows into the clutch valve and opens the check valve (1). When the shift lever is set at the “ENGAGED” position, the spool (2) is turned to (a) position, then the oil flows through the spool (2) into the accumulator and the clutch pack. Oil entering the clutch pack pushes the piston (4) to engage the clutch pack. The accumulator absorbs the engaging shock of the clutch pack.

When the shift lever is set at the “DISENGAGED” position, the spool (2) is turned to (b) position, then the oil is stopped by the spool (2) and the oil in the PTO clutch pack and accumulator is drained into the transmission case. Thus the piston (4) is pushed back, the brake plate (7) is also moved to contact the brake disc (6) so as to stop the rotation and the drag of the PTO shaft.

(d) Drain (To the Transmission Case)

A : PTO Clutch Valve  
B : Accumulator  
C : PTO Clutch Pack
[3] GROUND PTO (IF EQUIPPED)

(1) Power Train

The ground PTO gear section is located in the mid case, and it uses constant mesh. It is shifted by the ground PTO shift lever to shift the shifter. The power train of ground PTO is as shown in figure.

Then the PTO shaft is turned an amount proportional to the tractor traveling speed.

a : Ground PTO Position  b : PTO Speed

W102245

(2) Shift Linkage

The ground PTO can be engaged only when PTO speed change lever is in the neutral position.

The ground PTO lever (1) is connected directly to the shift fork (4). When the ground PTO lever (1) is moved to the A side, the shift fork (4) is also moved to A side, then the ground PTO is “Engaged”. When the ground PTO lever (1) is moved to the B side, the ground PTO is “Disengaged”.

(1) Ground PTO Lever  (2) PTO Speed Change Lever  (3) Shift Arm  (4) Shift Fork

W1022300
[4] TWO STAGE PTO (IF EQUIPPED)

(1) Power Train

The two stage PTO gear section is located in the mid case, and it uses constant mesh.

(1) Gear for High
(2) Gear for Low
(3) PTO Drive Shaft
(4) Shifter
(5) PTO Counter Shaft

L : Lo-speed Shift
N : Neutral Position
H : Hi-speed Shift

(2) Shift Linkage

The links from the PTO speed change lever (1) to the shift fork (4) are connected as shown in the figure.

When the PTO speed change lever (1) is moved to L side, the shift fork (4) is moved to the L side by means of the rod (2) to the Lo-speed side. When the PTO speed change lever (1) is moved to the H side, the shift fork (4) is moved to the Hi-speed side.

[2] GST SYSTEM

- Electrical Diagnosis by Electronic Instrument Panel (IntelliPanel)

Turn ON the main switch.

Normal Display is indicated on the LCD* screen
Page 9-M18

Yes

The ERROR message is indicated first on the LCD screen
Page 3-S3

No

Even if the display mode switch is pushed more than five times, the ERROR display is not indicated on the LCD screen
Page 9-M18

When the switch is pushed, the ERROR message is indicated on the LCD screen after the display of PTO speed
Page 3-S3

Check the corresponding sensors by "TEST Mode" of electronic instrument panel
Page 9-S13

Check the corresponding wiring harnesses, switches, solenoids and sensors by using circuit tester, etc.
Section 9

Replace the defected parts, if necessary

Execute GST Fine-adjustment
Page 3-S49

Confirm the operation

Delete the ERROR information from electronic instrument panel ("Error Information Reset Mode")
Page 9-S15

[3] HST SYSTEM

HYDROSTATIC TRANSMISSION

- System will not operate in either direction:
  - Check input shaft:
    - Not turn:
      - Repair or replace
    - Turn:
      - Check oil level:
        - Low:
          - Fill to proper level
        - Good:
          - Check linkage (HST pedal to neutral holder):
            - Good:
              - Check (Charge pressure):
                - Good:
                  - Check (High relief pressure):
                    - High above maximum allowable limit:
                      - Replace (Oil filter cartridge):
                        - Can't repair:
                          - Inspect (Charge relief valve):
                            - Good:
                              - Repair (flush):
                                - Defective:
                                  - Can't repair
                                - Good:
                                  - Replace (Check and high pressure relief valve):
                                    - Low below minimum allowable limit
                                  - Good
                                    - Replace hydrostatic transmission assembly
## PTO SYSTEM

### PTO CLUTCH

<table>
<thead>

4. CHECKING, DISASSEMBLING AND SERVICING

[1] MANUAL TRANSMISSION MODEL

(1) Checking and Adjusting

Operating Pressure of PTO Clutch Valve
1. Start the engine and warm up the transmission fluid, and then stop the engine.
2. Remove the plug (1) (PT 1/8) on the PTO valve spool (2).
3. Set the pressure gauge.
4. Start the engine and measure the pressure.
5. For adjustment use the pressure reducing valve adjustor (3) of the regulating valve assembly (5).

■ IMPORTANT
• Do not connect the universal joint of the implement to the tractor PTO shaft while testing.

Condition
• Engine speed ........ Idling speed
• Oil temperature ...... 40 to 60 °C 104 to 140 °F

(Reference)
• Turn to clockwise direction → Pressure is increased
• Turn to counterclockwise direction → Pressure is decreased

<table>

W1012774
(2) Disassembling and Assembling

(A) Clutch Housing

Draining the Transmission Fluid
1. Place oil pans underneath the transmission case.
2. Remove the drain plugs (1).
3. Drain the transmission fluid.
4. Reinstall the drain plugs (1).

(When refilling)
- Fill up from filling port after removing the filling plug (2) until reaching the upper notch on the dipstick (3).
- After running the engine for few minutes, stop it and check the oil level again, add the fluid to prescribed level if it is not correct level.

| Transmission fluid capacity | L3130 | 42 L  |
|                            | L3430 | 11.1 U.S.gals | 9.2 Imp.gals |
|                            | L3830 | 43 L  |
|                            | L4630 | 11.4 U.S.gals | 9.5 Imp.gals |
|                            | L5030 | 45 L  |
|                            |      | 11.9 U.S.gals | 9.9 Imp.gals |

■ IMPORTANT
- Use only KUBOTA SUPER UDT fluid. Use of other oils may damage the transmission or hydraulic system. Refer to “LUBRICANTS, FUEL AND COOLANT”. (See page G-7, 8.)
- Do not mix different brands of fluid together.

(1) Drain Plugs  (2) Filling Plug  (3) Dipstick

(A) Oil level is acceptable within this range.

W1012748

ROPS (Center ROPS Type)
1. Remove the upper frame (1) from ROPS lower frame (2).
2. Disconnect the light connectors.
3. Remove the shields (3).
4. Remove the lower frames (2).

(When reassembling)
■ NOTE
- Do not firmly tighten all screws until most components are attached.

(1) Upper Frame  (2) Lower Frame  (3) Shield

W1049334
Battery, Front Grill, Skirt and Bonnet
1. Open the bonnet (1) and disconnect the battery negative cable.
2. Disconnect the head light connector and remove the front grill (3).
3. Remove the left and right side skirts (2).
4. Remove the bonnet (1).

**NOTE**
- When disconnecting the battery cords, disconnect the negative cord first, when connecting, positive cord first.

(1) Bonnet (3) Front Grill
(2) Skirt

ROPS
1. Remove the lower connector (2).
2. Remove the plate mounting screws (4), (8).
3. Remove the upper frame (1) from ROPS lower frame (5).

(When reassembling)

**NOTE**
- Do not firmly tighten all screws until most components are attached.

W1051168
Steering Joint, Brake Pedal Rod and Electric Wiring
1. Remove the tank frame support (1).
2. Remove the universal joint bolt (7) and steering joint support (3), and then remove the steering joint (2).
3. Disconnect the hand accelerator wire and foot accelerator wire (4).
4. Disconnect the wiring connectors for engine stop solenoid (5), engine tachometer sensor (6) and glow plug.
5. Disconnect the brake pedal rod.

(When reassembling)
- When accelerator wire is installed, adjust the wire length as hit both the idling speed adjusting bolt and the maximum speed adjusting bolt by lever within the stroke of the accelerator lever.
- Set the steering joint (2) by the joint support (3) so that the steering wheel is turned lightly.
- Be sure to check and adjust the brake pedal free travel. (See page G-18.)

Clutch Rod, Brake Pedal Rod and Electric Wiring
1. Disconnect the brake pedal rod (5) and clutch pedal rod (4).
2. Disconnect the wiring connectors for alternator (1), coolant temperature sensor (7), oil pressure switch (2), fuel unit (3), starter motor (6) and battery.
3. Remove the clamps and ground earth of wiring harness and collect wiring harness to the step.

(When reassembling)
- Be sure to check and adjust the clutch and brake pedal free travel. (See page G-18, 24.)
Shuttle Switch Connector
1. Remove the panel cover and steering post cover.
2. Disconnect the shuttle switch connector (1).
(1) Shuttle Switch Connector
**Seat and Lever Grips**

1. Remove the seat (1) with seat bracket.
2. Remove the lever grip for main shift lever (3), range gear shift lever (2), front wheel drive lever (4), auxiliary control lever (7), position control lever (6), draft control lever (5) (if equipped), ground PTO lever (8) (if equipped) and PTO gear shift lever (9) (if equipped).
3. Disconnect the differential lock rod (10).
4. Remove the lowering speed adjusting knob (11).
5. Disconnect the PTO speed change connector (12).

KiSC issued 02, 2007 A
**Step and Floor Seat**

1. Disconnect the ground cable which is attached on left side of transmission case.
2. Disconnect the panel frame connector (1) from fuel tank frame.
3. Remove the step and floor seat mounting bolt and nut.
4. Dismount the step, fender, floor seat and panel frame as a unit after checking whether there is forgetting to disconnect wiring.

*(When reassembling)*

- Be sure to set the washers and rubber plates of the floor seat and step mounting bolt at an original positions as shown in figure.
- Before mounting the floor seat and step, be sure to set both the shuttle lever rod and the shuttle arm to the neutral position, and then connect the shuttle lever rod securely.

**Hydraulic Pipes**

1. Remove the main delivery pipe 1 (8).
2. Disconnect the main delivery pipe 2 (2) at the rear hydraulic block (1) and return pipe (6) at the mid case, and then remove the front hydraulic block (7) with pipes and bracket as a unit.
3. Remove the suction pipe (4) with oil filter (3).
4. Remove the PTO delivery pipe (5).

*(When reassembling)*

- Be sure to set the washers and rubber plates of the floor seat and step mounting bolt at an original positions as shown in figure.
- Before mounting the floor seat and step, be sure to set both the shuttle lever rod and the shuttle arm to the neutral position, and then connect the shuttle lever rod securely.

**Separating Engine and Clutch Housing**
1. Place the disassembling stand under the engine and clutch housing case.
2. Remove the fuel tank support mounting bolts.
3. Remove the engine and clutch housing mounting screws and nuts.
4. Separate the engine and clutch housing while lifting up the tank frame.

*When reassembling*
- Apply grease to the spline of clutch shaft.
- Apply liquid gasket (Three Bond 1211 or equivalent) to joint face of the flywheel housing and clutch housing.

Shift Levers
1. Disconnect the brake rods (6).
2. Tap out the spring pins (2) of main shift rod 1 (3).
3. Remove the shuttle shift arm stopper mounting screw, and then pull the shuttle shift shaft (1) with arm (4) up.

(When reassembling)
- Tap in the spring pins (2) so that their split portion may face forward.
- When reassembling the shuttle shift arm (4) to the shuttle fork rod (5), be sure to install it to the groove A.

Separating Clutch Housing and Mid Case
1. Remove the clutch housing and mid case mounting screws and nuts.
2. Separate the clutch housing and mid case.

(When reassembling)
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the clutch housing and mid case.

**Shaft Case**

1. Remove the shaft case mounting screws.
2. Screw down the two M6 screws (1) into the shaft case (2) and pull it out.
3. Take out the shaft case (2).

**When reassembling**
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the shaft case and clutch housing case.

**When replacing oil seal in shaft case**
- Install the oil seal (3) as shown in the figure, noting its direction.
- Apply grease to the oil seal (3).

(1) M6 Screw
(2) Shaft Case
(3) Oil Seal
23T (24T) Gear Shaft, 27T (26T) Gear and Front Axle Drive Shaft
1. Remove the 23T gear shaft (3).
2. Remove the external snap ring (1) and 27T gear (2).
3. Pull out the front axle drive shaft (4) to the rear side.

(When reassembling)
- Install the oil seal (7) on the 18T gear shaft (5), noting the direction of the oil seal (7) as shown in the figure.
- Direct the boss side of the gear (2) to the bearing side.
- Apply small amount of the grease to the oil seal (6), (7).
- Install the front axle drive shaft (4) from front side after assembling the clutch housing case and mid case. Then install the bearing (10), sleeve (11), collar (12), oil seal (9), internal snap ring (8), O-ring (14) and spacer (13) in order.

Clutch Housing Bearing Holder
1. Remove the three interlock balls (2) after removing the stopper screw (1).
2. Pull out the clutch housing bearing holder (5) with using two jack bolts (6).

■ NOTE
- Take care not to fly out the balls (3) and springs (4) when pull out the bearing holder (1).

(When reassembling)
- Tap in the clutch housing bearing holder (5) with plastic hummer until contact to clutch housing case, and then tighten the screws to specified torque.
- Install the three interlock balls (2) with a small amount of grease to the clutch housing bearing holder (5) after setting the shift forks and shift rods to the neutral position.

(5) Clutch Housing Bearing Holder
(6) Jack Bolt
### Shaft Assemblies

1. Remove the external snap ring (1) and collar (2).
2. Draw out the shaft assemblies (3), (5), (6), (7), (8).

### Counter Shaft

1. Remove the internal snap ring (1) and remove both side of the bearings (2), (16).
2. Remove the gears on the counter shaft (12) and external snap rings (5).

#### (When reassembling)
- Reinstall the synchronizer keys (9) in the key grooves of the synchronizer rings (6) firmly.
(B) Mid Case

NOTE
- For the disassembling procedure from “Draining the Transmission Fluid” to “Propeller Shaft”, refer to page 3-S18 to 3-S24.

Main Shift Lever and Brake Rods
1. Tap out the spring pins (2) of main shift rod (1).
2. Remove the main gear shift lever (4) with the support (3).
   (When reassembling)
   • Tap in the spring pins (2) so that their split portion may face forward.

Separating Mid Case and Transmission Case
1. Separate the mid case and transmission case after removing their mounting screws.
   (When reassembling)
   • Confirm to insert the PTO shaft to PTO clutch firmly, turning the PTO shaft.
   • Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the mid case and transmission case.

| Tightening torque | Mid case and transmission case mounting screw | 77.5 to 90.2 N·m  
|                   |                                             | 7.9 to 9.2 kgf·m  
|                   |                                             | 57.1 to 66.5 ft-lbs  |
|                   | Mid case and transmission case mounting nut  | 102.9 to 117.6 N·m  
|                   |                                             | 10.5 to 12.0 kgf·m  
|                   |                                             | 75.9 to 86.8 ft-lbs  |
|                   | Mid case and transmission case mounting stud bolt | 39.2 to 49.0 N·m  
|                   |                                             | 4.0 to 5.0 kgf·m  
|                   |                                             | 28.9 to 36.2 ft-lbs  |

Separating Mid Case
1. Lift up the shuttle shift arm (1).
2. Separate the mid case from the clutch housing after removing their mounting screws.
   (When reassembling)
   • Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of clutch housing and mid case.
   • When reassembling the shuttle shift arm (1) to the shuttle fork rod (2), be sure to install it to the groove A.

| Tightening torque | Clutch housing and mid case mounting screw | 77.5 to 90.2 N·m  
|                   |                                             | 7.9 to 9.2 kgf·m  
|                   |                                             | 57.1 to 66.5 ft-lbs  |

|                   |                                             | 10.5 to 12.0 kgf·m  
|                   |                                             | 75.9 to 86.8 ft-lbs  |
|                   | Clutch housing and mid case mounting stud bolt | 38.2 to 45.1 N·m  
|                   |                                             | 3.9 to 4.6 kgf·m  
|                   |                                             | 28.2 to 33.3 ft-lbs  |

(1) Shuttle Shift Arm
(2) Shuttle Fork Rod

A : Fork Rod Groove
PTO Clutch Valve
1. Remove the PTO clutch valve (2) as a unit.
2. Pull out the pipe (1).

(When reassembling)
- Apply small amount of grease for the O-ring (3).
- Install the pipe (1) to the hole (4) of the PTO clutch valve (2) firmly.
- Replace the pipe (1) with new one.

Shuttle Shaft
1. Remove the external snap ring (17) and collar (16).
2. Draw out the bearing (15) by the bearing puller.
3. Remove the gears, collars and etc.
4. Remove the external snap ring (12), and then remove the hub (10) and other parts.

(When reassembling)
- Apply enough transmission fluid to the synchronizer portion, needle bearings (3) and thrust collar (14).
- Direct the grooved side of the thrust collar (14) to the needle bearing (3) side.
- Install the protrusion portions (B) of the center rings (6) to the holes (A) of the gears (4), (13) firmly.
- Install the protrusion portions (D) of the outer synchronizer rings (7) to the grooves (C) of the inner synchronizer rings (5).
- Install the external snap ring (12) to the groove of the shuttle shaft (2) firmly.
- Install the synchronizer keys (8) in the key grooves of the outer synchronizer rings (7) firmly.

A : Holes of the Gear
B : Protrusion Portion of the Center Ring
C : Groove of the Inner Synchronizer Ring
D : Protrusion Portion of the Outer Synchronizer Ring
Clutch Hub and Clutch Discs of PTO Clutch

1. Remove the internal snap ring (8), and then take out the clutch discs (5), the back plate (7), the steel plates (4) and (6), the hub (3) and the bearing (2).

(When reassembling)
- Install the clutch discs (5) and steel plates (4) and (6) mutually. (Refer to figure below.)
- Do not confuse the two types steel plates. The steel plates with the plug rubbers (10) are (6) and without plug rubbers are (4).
- Do not confuse the back plate (7) and steel plates. The back plate (7) is thicker than the steel plates.
- Assemble the plug rubbers portion of the three steel plates (6) are same positions while assembling them. (Refer to figure below.)
- Apply enough transmission fluid to the discs (5).
- Confirm the moving of the piston (11) smoothly when pressure air at 0.29 to 0.39 MPa (3 to 4 kgf/cm², 42 to 57 psi) is sent to clutch pack. (Refer to the figure left.)

Accumulator Valve of PTO Clutch

1. Remove the internal snap ring (1).
2. Remove the spring seat (2).
3. Draw out the spring (4) and piston (3).

Transmission Bearing Holder

1. Remove the transmission bearing holder mounting screws.
2. Tap out the spring pin (8) on the shift fork rod (3).
3. Jack up the bearing holder (1) by using the two jack screws (5) until the taper roller bearing (7) can be removed.

**NOTE**
- Jack up the bearing holder while hitting the two shafts (2) (4) by copper hummer or soft hummer.

4. Jack up more and remove the transmission bearing holder (1).

*(When reassembling)*
- Tap in the transmission bearing holder with soft hummer until contact to transmission case, and then tighten the screws to specified torque.
- Tap in the spring pin (8) so that its split portion may face forward.

(Refer to figure.)

| Tightening torque | Transmission bearing holder mounting screw | 48.1 to 55.9 N·m
| 4.9 to 5.7 kgf·m | 35.5 to 41.2 ft-lbs |

Differential Lock Shift Fork
1. Tap out the left side spring pin (4).
2. Remove the cotter pin and take out the clevis pin (3).
3. Draw out the differential lock fork shaft (1) and take out the differential lock shift fork (2).

(When reassembling)
- Apply grease to the left and right oil seals on the transmission case.
- Insert the clevis pin (3) from the top and install the washer and cotter pin.
- Tap in the spring pin (4) so that its split portion a may face outward as shown in the figure.

PTO Shaft
1. Remove the PTO shaft cover.
2. Remove the bearing case mounting screws, and draw out the PTO shaft (1) with bearing case (2).
3. Remove the internal snap ring (3).
4. Top out the PTO shaft (1) to the front.

(When reassembling)
- If the lock nut (6) was removed, replace it with a new one. After replacing, be sure to stake it firmly.
- Install the slinger (7) firmly.
- Apply grease to the oil seal (4) and install it, noting its direction.

(1) Differential Side Gear  (2) Differential Side Gear Washer  (3) Differential Case Cover
Differential Pinion Shaft and Differential Pinion
1. Draw out the differential pinion shaft 2 (5), and take out the differential pinion (3) and differential pinion washer (4).
2. Draw out the differential pinion shaft (1), and take out the differential pinion (2) and differential pinion washer.

■ NOTE
- Arrange the parts to know their original position.

(When reassembling)
- Check the differential pinions (2) and (3), and pinion shaft (1) and (5) for excessive wear. If these parts are damaged or excessively worn, replace their parts they are in mesh with, or they sliding on.
- Apply molybdenum disulfide (Three Bond 1901 or equivalent) to the inner circumferential surface of the differential pinions.
- Install the parts to their original position.
- Install the differential pinion washer (4), noting its groove position.

Differential Side Gear
1. Take out the differential side gear (2) and differential side gear washer (1).

(When reassembling)
- Check the thrust and bearing surface of both differential side gears (2). If they are worn or damaged, bores in the differential case may also be damaged. Be sure to replace their parts.
(3) Servicing

(A) Bearing, Gear and Shaft

Checking Bearing
1. Hold the inner race, and push and pull the outer race in all directions to check for wear and roughness.
2. Apply transmission fluid to the bearing, and hold the inner race. Then turn the outer race to check rotation.
3. If there is any defect, replace it.

Clearance between Gear and Spline
1. Secure the gear with a vise.
2. Set a dial indicator (lever type) with its finger on the spline.
3. Move the shaft to measure the clearance.
4. If the clearance exceeds the allowable limit, replace them.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Clearance between Gear and Shaft
1. Measure the shaft O.D. (rubbing surface).
2. Measure the gear I.D. (rubbing surface).
3. Measure the O.D. of the two needles installed diagonally in the needle bearing.
4. Calculate the clearance
   (Clearance = Gear I.D. – (2 \times needle O.D.) + shaft O.D.)
5. If the clearance exceeds the allowable limit, replace them.

<table>
<thead>
<tr>

</tbody>
</table>

**Checking Contact between Coupling and Shifter**

1. Check to see if there is flaw or wear on the spline of the coupling and shifter, and the key groove on the coupling.
2. Engage the shifter with the coupling, and check that they slide smoothly.
3. Similarly, check that there is any flaw or wear on the gear splines.
4. If there is any defect, replace them.

**Flaw on Synchronizer Key and Spring**

1. Check the projection in the center of the synchronizer key for wear.
2. Check the spring for fatigue or wear on the area where the spring contacts with the keys.
3. If there is any defect, replace them.

**Side Clearance between Synchronizer Ring and Gear (In Contact)**

1. Press the synchronizer ring against the tapered portion of the gear, and measure the side clearance.
2. Apply thin film of red lead to the tapered portion, press the ring against it by hand, rub them together a few times, and check the contact.
3. Check the tooth surface and key grooves of the ring for wear.
4. If the side clearance exceeds the allowable limit or if there is any defect, replace the synchronizer ring.

---

**Spiral Bevel Gear Turning Torque**

**NOTE**
- It is necessary to adjust the spiral bevel gear turning torque, when replacing the differential gears, transmission case or other relative parts.

1. Assemble the differential gears to transmission case. At this time, install the some shims (3) to the spiral bevel gear side.
2. Check the turning torque by using turning torque tool (1).
   - Turning Torque Tool: Weld socket on the brake shaft
     (Brake shaft Part No. TA040-26710)
3. Add or reduce the thickness of shims (3) to make the specified turning torque.
4. After getting the specified turning torque, divide the thickness of shims to left and right side.
5. Assemble the transmission case and adjust the backlash and tooth contact with spiral bevel pinion. (See next page.)

<table>
<thead>
<tr>
<th>Turning torque of 37T spiral bevel gear</th>

(3) Adjusting Shim  
(4) Differential Support
**Backlash and Tooth Contact between Spiral Bevel Gear and Spiral Bevel Pinion Shaft**

1. Set the dial indicator (lever type) with its finger on the tooth surface.
2. Measure the backlash by fixing the spiral bevel pinion shaft (3) and moving the spiral bevel gear (4) by hand.
3. When the backlash is too large, decrease the number of shims (6) in the side of the spiral bevel gear, and insert the shims (5) of the same thickness as the removed ones to the opposite side. When the backlash is too small, do the opposite way to increase backlash.
4. Adjust the backlash properly by repeating the above procedure.
5. Apply red lead lightly over several teeth at three positions equally spaced on the spiral bevel gear.
6. Turn the spiral bevel pinion shaft, while pressing a wooden piece against the periphery on the spiral bevel gear.
7. Check the tooth contact. If not proper, adjust according to the instructions below.

<table>
<thead>
<tr>

[2] GLIDE SHIFT TRANSMISSION (GST) MODEL

(1) Checking and Adjusting

(A) Electrical Adjusting [GST Fine-adjustment with Electronic Instrument Panel (IntelliPanel)]

NOTES
- Before executing the following fine-adjustment, refer to “Testing, Setting and Adjusting by Electronic Instrument Panel” of an Electrical System. (Refer to page 9-S12.) The fine-adjustment function is a function to update the data of the memory device in the ECU when a sensor, a valve, and an electronic instrument panel which relates to the GST system are repaired or are re-installed. There are three kinds of fine-adjustment functions in the GST system.

GST Lever Sensor Fine-adjustment
(Setting the GST lever’s neutral position with its sensor)

IMPORTANT
- As for this fine-adjustment, be sure to set it correctly because the set state becomes the standard of the control thereafter.

NOTE
- When the GST lever sensor, the ECU or the electronic instrument panel is replaced, this adjustment is required.

1. Set the GST shift lever to Neutral position.
2. Push down both the display mode switch (2) and the travel speed switch (3) at once, continue holding switches, and then turn the main switch to ON position.
3. The “Mode Selection Display” (a) is indicated on the LCD (1). And release the switches.
4. Press the display mode switch (2) to move the flashing part, and flash the “E”.
5. Hold down the display mode switch (2) for more then 2 seconds at this condition, and the buzzer rings and Mode E is selected.
6. “LEVER” is displayed (b) and “PUSH SW” is displayed (c) for five seconds.
7. Hold down the display mode switch for more than 2 seconds. (This preserve the adjusted value to the ECU.)
8. “OK” is displayed (d) on LCD screen to tell that preserving to ECU has been made correctly. Turn off the main switch to end the mode.
9. If “NG” is displayed (f), it means the preserving has not been made correctly (4). Turn off the main switch and repeat the procedure.
10. If “LEVER” is displayed (b) first and then “ERROR-70” shows up (e), it means the lever sensor voltage is out of specification. In this case;
   - Check to see that GST lever is at the Neutral position.
   - Check the lever sensor voltage in the Test Mode (Mode “A”) (see page 9-S13). If out of specification, replace the sensor itself.

Liquid Crystal Display (LCD)
Display Mode Switch
Travel Speed Switch

KiSC issued 02, 2007 A
**GST Valve Fine-adjustment**  
(Setting the function of proportional reducing valve)

**NOTE**
- When the ECU or GST valve is replaced, this adjustment is required.

1. Push down both the display mode switch and the travel speed switch at once, continue holding switches, and then start the engine.
2. Select Mode F by the procedure from 3 to 5 which has been described to previous page.
3. “P-VALVE” is displayed and STEP-01 is displayed the three seconds after.

**NOTE**
- To make this adjustment, follow these steps in the exact order described. (Otherwise the switch does not work to go to next step. At “STEP-01” and “STEP-03”, however, the next step can be moved without their settings.)
- Push the display mode switch to move to the next step.

4. **STEP-01 (c):** Release parking brake.
5. **STEP-02 (d):** Set the engine speed at 1000 to 1400 min⁻¹ (rpm).
6. **STEP-03 (e):** Set front tires straight ahead.
7. **STEP-04 (f):** Operate the speed selection lever (GST lever) as follows; disengaged the clutch, select “forward” with the shuttle lever, and shift the GST lever from 1 thru 12 several times.
   Set the GST lever at the positions other than neutral.
8. **STEP-05 (g):** Set the GST lever to **Neutral** position.
9. **STEP-06 (h):** Set shuttle lever to forward and engage clutch.
10. **PUSH SW (i):** Push the display mode switch for more than three seconds.
11. **STEP-07 (j):** To preform this function the operator must be seated on the tractor.
    After a short delay the tractor will begin to move slowly. And then, after it moves a little, the tractor stops automatically. (Fine-adjustment is being executed.)
12. **OK** is displayed: The setting has been preserved correctly to the ECU.
13. **NG** is displayed: The setting has not been correctly saved in the ECU. Repeat the entire procedure.

KiSC issued 02, 2007 A
GST Shift Shock Fine-adjustment Mode  
(Adjusting the clutch engaging interval)

■ NOTE  
- When the sense of shifting shock is not suitable, shifting shock can be changed by this adjustment.

1. Push down both the display mode switch and the travel speed switch at once, continue holding switches, and then start the engine.

2. Select Mode G by the procedure from 3 to 5 which has been described to page 3-S49.

3. “SHOCK” is displayed (b) first and then the numerical code setting is displayed (c).  
   The number “−9” through “+9” can be displayed. This has been factory-adjusted to “0”.

4. Setting;  
   - For lighter shifting shock;  
     Press the travel speed switch to reduce the number.
   - For higher shifting shock;  
     Press the display mode switch to increase the number.

5. Move the tractor to confirm the shifting shock.

6. Turn off the key. Then setting will be put in memory.

■ NOTE  
- If the shift shock has been adjusted but no remarkable effect can be felt, keep the setting at “0”.

(B) Hydraulic Checking

Checking GST System Pressure
1. Start the engine and warm up the transmission fluid, and then stop the engine.
2. Remove the GST system pressure checking port (1) plug (PT 1/8) on the GST valve (2).
3. Install the GST valve adaptor (see page G-53) to checking port (1), and then install the threaded joint, cable and pressure gauge.
4. Start the engine and set the idling speed. Set the shift levers to “Neutral”.
5. Measure the pressure.
6. If the measurement is not within factory specifications, adjust the pressure reducing valve adjustor (4) on the regulating valve assembly (5).

Condition
- Engine speed: Idling speed
- Oil temperature: 40 to 60 °C (104 to 140 °F)

(Reference)
- Turn to clockwise direction → Pressure is increased
- Turn to counterclockwise direction → Pressure is decreased

Checking Regulating Valve Setting Pressure
1. Start the engine and warm up the transmission fluid, and then stop the engine.
2. Remove the pressure checking port (5) plug (PT 1/8).
3. Install the adaptor “7” to checking port (5) and then install the adaptor “D”, the threaded joint, cable and pressure gauge.
4. Start the engine and set the maximum engine speed. Set the shift levers to “Neutral”.
5. Measure the pressure. (Do not turn the steering wheel.)
6. If the measurement is not within factory specifications, adjust the regulating valve adjustor (4) on the regulating valve assembly (1).

</table>

Condition
- Engine speed : Maximum
- Oil temperature : 40 to 60 °C
  104 to 140 °F

(Reference)
- Turn to clockwise direction → Pressure is increased
- Turn to counterclockwise direction → Pressure is decreased

Checking Pilot Pressure
1. Start the engine and warm up the transmission fluid, and then stop the engine.
2. Remove the pilot pressure checking port plug (PT 1/8) on the GST valve (2).
3. Install the adaptor “D” or GST valve adaptor (3) to the checking port (1), and then install the threaded joint, cable and pressure gauge.
4. Start the engine and set the maximum speed.
5. Disengage the main clutch and shift the GST lever to “1st” position, shuttle shift lever to “Forward” or “Reverse” position.
6. Measure the pressure.
7. When the pilot pressure is not within factory specifications:
   Check the pilot orifice is clogged, movement of the shift forks, shift pistons and shift check valves.

**IMPORTANT**
- Do not engage the main clutch while checking.

<table>

Condition
- Engine speed : Maximum
- Oil temperature : 40 to 60 °C
  104 to 140 °F
- Shifting : GST lever to be “1st”
  Shuttle shift lever to be “Forward” or “Reverse”
Checking Clutch Pack Pressure

1. Start the engine and warm up the transmission fluid, and then stop the engine.
2. Remove the clutch pack pressure checking port plug (PT 1/8) on the GST valve (2).
3. Install the adaptor “D” or GST valve adaptor to the checking port (1), and then install the threaded joint, cable and pressure gauge.
4. Start the engine and set the idling speed.
5. Disengage the main clutch and shift the GST lever to “1st” position, shuttle shift lever to “Forward” position.
6. Measure the pressure.
7. When the clutch pack pressure is not within factory specifications:
   - Check the clutch valve and clutch pack.
8. Check the pressure changes while shifting the shuttle shift lever “Reverse” to “Forward” and shifting the GST lever from “Neutral” to “12th” or “8th”.
9. If the pressure does not change correctly, check the low-pass valve and proportional reducing valve.

**IMPORTANT**
- Do not engage the main clutch while checking.

(C) Others

Operating Pressure of PTO Clutch Valve

1. See page 3-S17.

W1032841
(2) Disassembling and Assembling

(A) Clutch Housing

Draining the Transmission Fluid
1. Place oil pans underneath the transmission case.
2. Remove the drain plugs (1).
3. Drain the transmission fluid.
4. Reinstall the drain plugs (1).

(When refilling)
- Fill up from filling port after removing the filling plug (2) until reaching the upper notch on the dipstick (3).
- After running the engine for few minutes, stop it and check the oil level again, add the fluid to prescribed level if it is not correct level.

| Transmission fluid capacity | L4630   | 43 L  |
|                           |         | 11.4 U.S.gals |
|                           |         | 9.5 Imp.gals  |
|                           | L5030   | 45 L  |
|                           |         | 11.9 U.S.gals |
|                           |         | 9.9 Imp.gals  |

IMPORTANT
- Use only KUBOTA SUPER UDT fluid. Use of other oils may damage the transmission or hydraulic system. Refer to “LUBRICANTS, FUEL AND COOLANT”. (See page G-7, 8.)
- Do not mix different brands of fluid together.

Battery, Front Grill, Skirt and Bonnet
1. Open the bonnet and disconnect the battery negative cable.
2. Disconnect the head light connector and remove the front grill (4).
3. Remove the left and right side skirts (3).
4. Disconnect window washer hoses (2). (Cabin model only.)
5. Remove the bonnet (1).

NOTE
- When disconnecting the battery cords, disconnect the negative cord first, when connecting, positive cord first.

| (1)    | Bonnet |
| (2)    | Window Washer Hose |
| (3)    | Skirt |
| (4)    | Front Grill |
Steering Joint, Brake Pedal Rod and Electric Wiring
1. Remove the tank frame support (2).
2. Remove the universal joint bolt (10) and steering joint support (6), and then remove the steering joint (1).
3. Disconnect the hand accelerator wire and foot accelerator wire (7).
4. Disconnect the wiring connectors for engine stop solenoid (8), engine tachometer sensor (9) and glow plug.
5. Disconnect the heater hoses (3), and then reconnect their hoses to make loop.

**NOTE**
* Put a mark to each heater hose before disconnecting.*
6. Disconnect the wiring connector for window washer tank (4) and compressor 1P connector (5).
7. Disconnect the brake pedal rod.

*(When reassembling)*
* When accelerator wire is installed, adjust the wiring length as hit both the idling speed adjusting bolt and the maximum speed adjusting bolt by lever within the stroke of the accelerator lever.
* Set the steering joint (1) by the joint support (6) so that the steering wheel is turned lightly.
* Be sure to check and adjust the brake pedal free travel. *(See page G-18.)*

---

Clutch Rod, Brake Pedal Rod and Electric Wiring
1. Disconnect the brake pedal rod (6) and clutch rod (4).
2. Disconnect the wiring connectors for alternator (1), coolant temperature sensor (9), oil pressure switch (2), fuel unit (3), starter motor (7) and battery.
3. Remove the clamps and ground earth of wiring harness and collect wiring harness to the step or cabin.
4. Remove the clamps (8) of A/C hoses (5). *(A/C model only.)*

*(When reassembling)*
* Be sure to check and adjust the clutch and brake pedal free travel. *(See page G-18, 24.)*
Air Conditioner Parts (A/C Model)
1. Remove the muffler (2).
2. Remove the air conditioner belt (4) and remove the compressor (1) mounting screw.
3. Remove the recovery tank (6) and window washer tank (7).
4. Disconnect the air cleaner hose (8).
5. Disconnect the recovery tank hose (5).
6. Disconnect the radiator upper hose (3).
7. Remove the battery (10).
8. Remove the battery stay mounting bolt.
9. Take out the compressor (1), condenser (11), receiver (12), hoses (13), battery stay (9) and etc. as a unit.

(When reassembling)
- After reassembling the compressor, be sure to adjust the air conditioner belt tension. (See page G-29.)

Shuttle Switch Connector
1. Remove the panel cover and steering post cover.
2. Disconnect the shuttle switch connector (1).

(1) Shuttle Switch Connector
**Seat, Seat Bracket and Lever Grips**

1. Remove the seat.
2. Remove the seat bracket (1) with seat suspension (6).
3. Remove the lever grips for position control lever (2), front wheel drive lever (5), GST lever (4) and creep shift lever (3).
4. Disconnect the differential lock rod (8).
5. Remove the lowering speed adjusting knob (7).

**Electric Connector for GST**

1. Disconnect the ECU connector (1).
2. Disconnect the GST lever sensor connector (2).
3. Remove the GST valve cover.
4. Disconnect the pressure switch connector (4), proportional reducing valve connector (5), solenoid valve connector (6), oil temperature sensor connector (8) and ground cables (7).

**PTO Shift Wire and Electric Connector**

1. Disconnect the PTO shift wire (2) at the PTO clutch valve (4).
2. Disconnect the traveling speed sensor connector (1).

**When reassembling**

- When connecting the PTO shift wire (2) to the clutch valve (4), be sure to adjust the length of wire as follows.
1. Set the PTO shift lever to **OFF (Neutral)** position.
2. Loosen the lock nut (3) of wire, and connect wire to the clutch valve lever, and then place the wire to the hook.
3. Tighten the lock nut (3) clockwise (pull the wire), and lock the nut just before the lever moves.

---
Cabin Assembly
1. Remove the outer roof of cabin.
2. Support the cabin with nylon straps (1) and hoists.
3. Loosen and remove the cabin mounting bolts (2) and nuts (9).
4. Dismounting the cabin from tractor body.

■ NOTE
- Lift the cabin while making sure it does not catch on anything.

(When reassembling)
- Be sure to install the washers and mount rubbers, etc. in their original positions.
- Before mounting the cabin, be sure to set both the shuttle lever rod and the shuttle arm to the neutral position, and then connect the shuttle lever rod securely.

KiSC issued 02, 2007 A
Propeller Shaft
1. Slide the propeller shaft cover (4) and (8) after removing the screws (7).
2. Tap out the spring pins (2), (6) and slide the couplings (1), (5) and then remove the propeller shaft with covers (4), (8).

(When reassembling)
- Apply grease to the splines of propeller shaft 1 (3).

Separating Engine and Clutch Housing
1. Place the disassembling stand under the engine and clutch housing case.
2. Remove the fuel tank support mounting screws.
3. Remove the engine and clutch housing mounting screws and nuts.
4. Separate the engine and clutch housing while lifting up the tank frame.

(When reassembling)
- Apply grease to the spline of clutch shaft.
- Apply liquid gasket (Three Bond 1211 or equivalent) to joint face of the flywheel housing and clutch housing.

| Engine and clutch housing mounting screw and nut | 77.5 to 90.2 N·m | 7.9 to 9.2 kgf·m | 57.1 to 66.5 ft-lbs |
| Engine and clutch housing mounting stud bolt | 39.2 to 49.0 N·m | 4.0 to 5.0 kgf·m | 28.9 to 36.2 ft-lbs |

Clutch Lever, Release Fork and Release Bearing
1. Remove the release fork mounting screws (2).
2. Draw out the clutch lever (3) to remove the release fork (1).
3. Remove the release bearing and release hub (4) together.

(When reassembling)
- Apply grease to the sliding surface of the clutch release hub.
- Apply grease to the clutch lever.

| Release fork mounting screw | 23.5 to 27.5 N·m | 2.4 to 2.8 kgf·m | 17.4 to 20.3 ft-lbs |

Shuttle Shift Arm and GST Valve Assembly

1. Disconnect the brake rod (3).
2. Remove the shuttle shift arm stopper screw, and then pull the shuttle shift shaft (1) with arm up.
3. Remove the GST valve (2) with using two jack bolts.
4. Remove the shift pins (6), (7).

**NOTE**
- Do not fall down the shuttle check pin (9) while disassembling.

*(When reassembling)*
- When reassembling the shuttle shift arm (4) to the shuttle fork rod (5), be sure to install it to the groove A.
- Place the 1-2 shift pin (6) and the 3-4 shift pin (7) at neutral position, main range shift pin (9) at L position (forward) and sub-range shift pin (10) at Hi position (rearward), and then assemble the GST valve.
- Be sure to match the each shift pin and shift piston.
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the GST valve assembly.
- Install the GST valve (2) by hand, and then tighten the screws. Do not use the hummer.
- Replace the pipe (8) with new one, if damaged.

Shaft Case
1. Remove the shaft case mounting screws.
2. Screw down the two M6 screws (1) into the shaft case (2) and pull it out.
3. Take out the shaft case (2).

(When reassembling)
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the shaft case and clutch housing case.

(When replacing oil seal in shaft case)
- Install the oil seal (3) as shown in the figure, noting its direction.
- Apply grease to the oil seal (3).

23T (24T) Gear Shaft and 27T (26T) Gear
1. Remove the 23T (24T) gear shaft (1).
2. Remove the external snap ring (3) and 27T (26T) gear (2).

(When reassembling)
- Install the oil seal (4) on the 18T gear shaft (6), noting the direction of the oil seal (4) as shown in the figure.
- Direct the boss side of the gear (2) to the bearing side.
- Apply small amount of the grease to the oil seal (4), (5).

**F : Front Side**

W1050076
1. Remove the internal snap ring (1) and remove both side of the bearings (2), (16).
2. Remove the gears on the counter shaft (12) and external snap rings (5).

**When reassembling**
- Reinstall the synchronizer keys (9) in the key grooves of the synchronizer rings (6) or (20) firmly.
- Be sure to install the synchronizer rings (18), (19), (20) with referring to page 3-S31.
(B) Mid Case

■ NOTE
- For the disassembling procedure from “Draining the Transmission Fluid” to “Propeller Shaft”, refer to page 3-S55 to 3-S60.

GST Valve Assembly
1. Disconnect the brake rods (2).
2. Remove the GST valve (1) with using two jack bolts.
3. Remove the shift pin (3), (4) and (6).

■ NOTE
- Do not fall down the shuttle check pin while disassembling.
(When reassembling)
- Place the 1-2 (3) and 3-4 shift pins (4) at neutral position, sub-range shift pin (7) at Hi position (rearward) and main range shift pin (6) at L position (forward), and then assemble the GST valve.
- Be sure to match the each shift pin and shift piston.
- Install the GST valve (1) by hand, and then tighten the screws. Do not use the hummer.
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the GST valve assembly.
- Replace the pipe (5) with new one, if damaged.

Separating Mid Case and Transmission Case
1. Separate the mid case and transmission case after removing their mounting screws.
(When reassembling)
- Confirm to insert the PTO shaft to PTO clutch firmly, turning the PTO shaft.
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the mid case and transmission case.

**Separating Mid Case**

1. Lift up the shuttle shift arm (1).
2. Separate the mid case from the clutch housing after removing their mounting screws.

**(When reassembling)**
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of clutch housing and mid case.
- When reassembling the shuttle shift arm (1) to the shuttle fork rod (2), be sure to install it to the groove (A).

Mid Case Bearing Holder

1. Remove the internal snap ring (9) and remove the disc spring (8) and clutch input hub (7).
2. Remove the external snap ring (6) and remove the GST clutch case (5).
3. Remove the mid case bearing holder mounting screws, and then take out the bearing holder (2) with PTO clutch (10) by using two jack bolts.

**NOTE**
- Take care not to fly out the ball (4) and spring (3) when pull out the bearing holder (2).

*When reassembling*
- Tap in bearing holder (2) with plastic hummer until contact to case, and then tighten the screws to specified torque.
- Assemble the disc spring (8) as shown in the figure.
- Install the internal snap ring (9) to the clutch case (5) as shown in the figure.
- Confirm the moving of the piston smoothly when pressure air at 0.29 to 0.39 MPa (3 to 4 kgf/cm², 42 to 57 psi) is sent to clutch pack. (Air must be sent from hole A.)

Shaft Assemblies

1. Pull out the sub-range shift rod (4) and remove the shift fork (3).
2. Remove the external snap ring (2) which is located at rear side of the mid case.
3. Draw out the shaft assemblies (1), (5), (6) and shuttle fork rod (7).

| (1) Reverse Gear Shaft | (5) Shuttle Gear Shaft |
| (2) External Snap Ring  | (6) Shuttle Shaft      |
| (3) Shift Fork         | (7) Shuttle Fork Rod   |
| (4) Sub-range Shift Fork Rod |               |

Disassembling PTO Clutch

1. See page 3-S32, S33.
GST Clutch Discs

1. Take out the clutch hub (2), clutch disc (3) and steel plate (5), (6) from clutch case (1).

(When reassembling)
- Assemble the three steel plates (6) with plug rubbers (4) to the front side, one steel plate (5) without plug rubber to the piston side. (Steel plate (5), (6) are used same part.)
- Do not pile up the plug rubber (4) portion on steel plates (6) while reassembling as shown in the figure.

Clutch Case and GST Clutch Piston

1. Remove the external snap ring (1) while pushing the spring retainer (2) by hand press.
2. Take out the spring retainer (2), springs (3) and piston (4).

(When reassembling)
- Apply small amount of the grease to the seal rings (8) when assemble the clutch case (7).
- Apply enough transmission fluid to the O-ring (6) and D-ring (5).
Shuttle Shift Gears

1. Remove the external snap ring (1) and thrust collar (2).
2. Remove the bearing (3) and remove the thrust collar (4), 21T gear (10) and synchronizer ring.
3. Remove the external snap ring (7) and remove the hub (8) with shifter, synchronizer ring and 24T gear (11).
4. Remove the external snap rings (5) and remove the needle bearings, thrust collars (6), (13) and shuttle forward shaft (14).
5. Remove the external snap ring (24) and collar (23) and remove the bearing (22), thrust collar (21), 18T gear (19) and synchronizer rings.
6. Remove the external snap ring (25) and remove the needle bearing (20).
7. Remove the external snap ring (18) and remove the hub (17) with shifter and synchronizer rings.

(When reassembling)
- Direct the groove side of the thrust collars (4), (21) to the gear side.
- Reinstall the synchronizer keys in the key grooves of the synchronizer rings.
- Install the synchronizer rings (26) securely, referring to page 3-S44.
- Direct the groove side of the hub (8) and shuttle forward shaft (14) as shown in figure.
(C) Transmission Case

NOTE
- For the disassembling procedure from “Draining the Transmission Fluid” to “Cabin Assembly”, refer to page 3-S55 to 3-S60.

Rear Wheel
1. Place disassembling stand under the transmission case, and support it with a jack.
2. Remove the rear wheels.
3. After removing the rear wheels, support it at both sides of rear axle by stands.

(When reassembling)

ROPS, 3 Point Linkages, Hydraulic Cylinders and Others
1. Remove the top link.
2. Remove the lift rods (2), lower links (6) and check chain (1) as a unit.
3. Remove the PTO shaft cover (5).
4. Remove the drawbar frame (7).
5. Disconnect the hydraulic cylinder hoses (8) and return hoses (10) at the rear hydraulic block (9).
6. Remove the two pins and remove the hydraulic cylinders (4).
7. Disconnect the brake rods.

(When reassembling)
- Apply grease to the lower link pins and hydraulic cylinder pins.

Rear Hydraulic Block and Lift Arm Support
1. Remove the GST delivery pipe. (Refer to 3-S59.)
2. Loosen the main delivery pipe support screw and disconnect the main delivery pipe at the rear hydraulic block (1). (Refer to 3-S59.)
3. Remove the rear hydraulic block (1), cover (2) and lift arm support (3) as a unit.

(When reassembling)
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the differential case and cover (2).

**Brake Case**

1. Remove the creep gear shift lever and its fulcrum screw. (If equipped.)
2. Remove the brake case mounting screws and nuts.
3. Separate the brake case, tapping the brake case lever lightly.

*When reassembling*

- Apply grease to the steel ball seats. (Do not grease excessively.)
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the brake cae and transmission case.
- Be sure to apply liquid gasket to A position.
- Be sure to fix the brake cam and cam plate.
- Before installing the brake case to the transmission case, install the cam plate to the transmission case.

**GST Valve Assembly**

1. Remove the GST valve assembly with using two jack bolts.
2. Remove the shift pin (4).

**NOTE**

- Do not fall down the shuttle check pin while disassembling.

*When reassembling*

- Place the 1-2 (1) and 3-4 (2) shift pins at neutral position, sub-range shift pin (5) at Hi position (rearward) and main range shift pin (4) at L position (forward), and then assemble the GST valve.
- Be sure to match the each shift pin and shift piston.
- Install the GST valve by hand, and then tighten the screws. Do not use the hummer.
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the GST valve assembly.
- Replace the pipe (3) with new one, if damaged.

Differential Lock Shift Fork

1. Tap out the left side spring pin (4).
2. Remove the cotter pin and take out the clevis pin (3).
3. Draw out the differential lock fork shaft (1) and take out the differential lock shift fork (2).

(When reassembling)

- Apply grease to the left and right oil seals on the transmission case.
- Insert the clevis pin (3) from the top and install the washer and cotter pin.
- Tap in the spring pin (4) so that its split portion a may face outward as shown in the figure.

(1) Differential Lock Fork Shaft
(2) Differential Lock Shift Fork
(3) Clevis Pin
(4) Spring Pin

a : Split Portion
PTO Shaft
1. Remove the PTO shaft cover.
2. Remove the bearing case mounting screws, and draw out the PTO shaft (1) with bearing case (2).
3. Remove the internal snap ring (3).
4. Top out the PTO shaft (1) to the front.

(When reassembling)
- If the lock nut (6) was removed, replace it with a new one. After replacing, be sure to stake it firmly.
- Install the slinger (7) firmly.
- Apply grease to the oil seal (4) and install it, noting its direction.

Disassembling Regulating Valve

■ NOTE
- The regulating valve has been precisely machined and assembled. It is advisable not to disassemble it as long as there is no necessary.

1. Remove the plate (8) and take out reducing spool (11), spring retainer (5) and spring (10).
2. Separate the regulating valve case (12) and support (4).
3. Take out the bush (6) and poppet (7).
4. Remove the joint bolt (14), and then take out the spring (13) and the poppet (9).
5. Take out the spring retainer (5) and spring (10).

(When reassembling)
- Take care not to damage the O-rings.

(E) GST Valve Assembly

■ NOTE
- The GST valve has been precisely machined and assembled. It is advisable not to disassemble it. If unavoidably necessary to do it, take the following precautions.

1. Tighten up the screws and nuts to their specified torques.
2. Be sure to clean the disassembled parts and dry them up with compressed air.
3. Do not wear any gloves other than rubber ones not use waste cloth. This is important for keeping the parts clean and free from rust.
4. Be careful not to drop the parts on the floor or workbench. Check any part, if dropped, for hit mark, scratch and burr.
5. Be sure to use a rubber or plastic hammer for reassembling.
6. Do not use a wire brush nor polish any part with sandpaper.
7. Apply super UDT oil to the O-rings and oil seals before reassembling. Do not use any metal-cleaning liquid.

Draining Transmission Fluid
1. See page 3-S55.
GST Valve Assembly
1. Remove the GST valve cover.
2. Disconnect the pressure switch connector (1), proportional reducing valve connector (2) solenoid connector (4) and oil temperature sensor connector (5).
3. Disconnect the GST delivery pipe (3).
4. Remove the GST valve assembly (6) using two jack bolts.

**NOTE**
- Do not fall down the shuttle check pin while assembling.
- Place the 1-2 shift pin (7) and the 3-4 shift pin (8) at neutral position, main range shift pin (10) at L position (forward) and sub-range pin (11) at Hi position (rearward), and then assemble the GST valve.
- Be sure to match each shift pin and shift piston.
- Install the GST valve assembly (6) by hand, and then tighten the screws. Do not use the hummer.
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the GST valve assembly.

**Low-pass Valve**

**IMPORTANT**
- Do not adjust or remove the adjustor (2), otherwise the GST clutch engagement feeling will be changed. If this valve is disassembled, be sure to check and adjust the low-pass pressure.

1. Separate the upper body and lower body. (See page 3-S80.)
2. Remove the plug (5).
3. Remove the stopper plate (6) and remove the low-pass poppet (4) and spring (3).

See page 3-S45.

(D) Differential Gears
See page 3-S46 to 3-S48.

(E) GST Clutch

**Clutch Disc Wear**
1. Measure the thickness of GST clutch disc with vernier calipers.
2. If the thickness is less than the allowable limit, replace it.

<table>
<thead>
<tr>
<th>Thickness of GST clutch disc</th>
<th>Factory spec.</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2.55 to 2.65 mm</td>
<td>2.50 mm</td>
</tr>
<tr>
<td></td>
<td>0.100 to 0.104 in.</td>
<td>0.098 in.</td>
</tr>
</tbody>
</table>

**Steel Plate Wear**
1. Measure the thickness of GST steel plate with vernier calipers.
2. If the thickness is less than the allowable limit, replace it.

<table>
<thead>
<tr>
<th>Thickness of GST steel plate</th>
<th>Factory spec.</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>

KiSC issued 02, 2007 A
[3] HYDROSTATIC TRANSMISSION (HST) MODEL

(1) Checking and Adjusting

(A) Electrical Adjusting [Adjustment with Electronic Instrument Panel (IntelliPanel)]

■ NOTE
- Before executing the following fine-adjustment, refer to “Testing, Setting and Adjusting by Electronic Instrument Panel” of an Electrical System. (Refer to page 9-S12.)

Adjustment of HST Range Gear Shift Lever Sensor

■ NOTE
- When the electronic instrument panel or range gear shift sensor was replaced, this adjustment is required.

1. Set the range gear shift lever to the M position.

2. Push down both the display mode switch (2) and the travel speed switch (3) at once, continue holding switches, and then turn the main switch to ON position.

3. The “Mode Selection Display” (a) is indicated on the LCD (1). And release the switches.

4. Press the display mode switch (2) to move the flashing part, and flash the “I”.

5. Hold down the display mode switch (2) for more than 2 seconds at this condition, and the buzzer rings and Mode I is selected.

6. “MHG” is displayed (b), and the existing symbol setting is flashing.

7. Press the display mode switch (2) to move the flashing part, and flash the “H” of the HST model.

8. Hold down the display mode switch (2) for more than 2 seconds at this condition, and the buzzer rings.

9. “OK” is displayed (c) : Lever sensor voltage is as specified.

10. “ERROR 71” is displayed (d) : Lever sensor voltage is not specified.

   In this case;
   - Check to see that the range gear shift lever is at M position.
   - Check the lever sensor voltage in the Test Mode (Mode “A”) (see page 9-S13). If out of specification, replace the sensor.

(1) Liquid Crystal Display (LCD)          (a) Mode Selection Display

[B] Hydraulic Checking and Adjusting

Checking High Pressure Relief Valve Pressure

**CAUTION**
- When checking, park the machine on flat ground, apply the parking brake.

1. Remove the hex. socket head plug from P1 or P2 port. (P2 is for forward and P1 is for reverse.)
2. Assemble adaptor C (07916-50371) and threaded joint (07916-50341) with the gasket between them.
3. Install the assemble adaptor C and threaded joint to P2 (forward) or P1 (reverse) port.
4. Install the cable, threaded joint in relief valve set pressure tester and high pressure gauge to threaded joint in order.
5. Check to see that parking brake is applied.
6. Run the engine at maximum speed.
7. Place the range gear shift lever in H position.
8. Depress the HST pedal, and measure the check and high pressure relief valve pressure.
9. If the measurement is not within the factory specification, check the check and high relief valve assembly. (See page 3-S103.)

### Important
- Measure quickly so that the relief valve may not be in operation more than 10 seconds.

### NOTE
- High pressure gauge is 40 MPa (400 kgf/cm², 5800 psi) full scale.

**(When reassembling)**
- Install the hex. socket head plug to the port with O-ring.

<table>
<thead>
<tr>
<th>Check and high relief pressure (Oil temperature at 40 to 60 °C (104 to 140 °F))</th>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>340 to 370 kgf/cm²</td>
<td>4836 to 5262 psi</td>
</tr>
</tbody>
</table>

W1012199
Checking Charge Relief Pressure

⚠️ CAUTION
- When checking, park the machine on flat ground, apply the parking brake.

■ NOTE
- Use a new transmission oil filter.
1. Remove the hex. socket head plug from P2 (or P1) port.
2. Assemble adaptor 58 (07916-52391) and thread joint (07916-50341) with the gasket between them.
3. Install the assembled adaptor 58 and thread joint to P2 port.
4. Install the cable, thread joint in relief valve set pressure tester and low pressure gauge to threaded joint in order.
5. Place the range gear shift lever in neutral.
6. Run the engine at maximum speed.
7. Release the HST pedal to set in neutral, and measure the charge pressure.
8. If the measurement is not within the factory specifications, check charge relief valve (3) (See page 3-S103) or adjust with adjusting shim.

■ NOTE
- Adjusting shim is located on between spring guide (6) and plug (7).
   (Reference)
   - Thickness of adjusting shim : 0.5 mm (0.02 in.)
   - Pressure change per 0.5 mm (0.02 in.) of shim :
     Approx. 61.8 kPa
     0.68 kgf/cm²
     8.97 psi

| Charge pressure (oil temperature at 50 to 60 °C (122 to 140 °F)) | Factory spec. | 2.26 to 2.45 MPa

W1012608
Operating Pressure of PTO Clutch Valve

1. Start the engine and warm up the transmission fluid, and then stop the engine.
2. Remove the plug (1) (PT 1/8) on the PTO valve spool (2).
3. Set the pressure gauge.
4. Start the engine and measure the pressure.
5. For adjustment use the adjusting shim (4) of HST charge relief valve (3).

**IMPORTANT**
- Do not connect the universal joint of the implement to the tractor PTO shaft while testing.

<table>
<thead>
<tr>

Checking Neutral

1. Disengage the front wheel drive lever. (Drive only rear wheels.)
2. Lift the rear of the tractor so that the rear wheels are off the ground and run the engine at low idling and drive only rear wheels.
3. Depress the one end of speed control pedal and release, and do the same at the other end.
4. If the rear wheels do not stop turning, adjust as following procedure of next page.
### Adjusting Neutral

**NOTE**
- **Stop the engine when adjusting the HST neutral.**
1. Set the cruise control lever to “OFF” position. (HST pedal is in **Neutral** position.)
2. Check to see that the length $a$ of HST control rod (2) and the length $b$ of neutral rod (6) are specified length.
   - If not, adjust as follows.
   - **Length $a$ (196.5 to 197.5 mm (7.74 to 7.78 in.))**
   - **Length $b$ (139.5 to 140.5 mm (5.49 to 5.53 in.))**
3. Loosen the hex. head screw (3) to make situation that HST control lever (4) moves freely. Run the engine for 5 seconds to make sure that the HST is in neutral position.
4. Tighten the hex. head screw (3) so that the HST control lever (4) does not turn.

**NOTE**
- **Be sure to tighten the hex. head screw with specified torque.**

<table>

### Cruise Lever Operating Force
1. Push the cruise control lever (1) into maximum tied position. After that pull it 50 mm (2 in.) back.
2. Measure the force needed to move the cruise control lever back into the maximum position at the top of the lever grip (2).
3. If the force is not within the factory specifications, loosen the lock nut (4) and adjust the tension of cruise spring (3).
4. Retighten the lock nut securely.

<table>
<thead>
<tr>

- **(4) Lock Nut**
Cruise Control Linkage and Maximum Travel Speed

**NOTE**

- Stop the engine when adjusting the cruise control linkage and pedal stroke.
- Be sure to adjust the HST neutral position (see page 3-S90).
- Be sure to check whether the “traveling speed coefficient” is suitable for tire size. If not, input the appropriate code number. (Refer to page 9-S14.)

1. Loosen the HST pedal mounting screws (4) and tighten the screws (4) while pulling up the front of HST pedal (1).
2. Adjust the height \( a \) of the pedal stopper bolt F (3) to 35 to 40 mm (1.38 to 1.57 in.).
3. Run the tractor actually and confirm whether traveling speed is a factory specification. (See table below.) If not, adjust by height of stopper bolt F (3).

### Condition

- Engine Speed: Rated speed
- Range Gear Shift Lever: H position
- HST Pedal: Fully depressed forward
4. Set the cruise control lever to fully forward (Maximum position). HST pedal also tilts.
5. Measure the clearance \( b \) of between bottom of HST pedal and tip of pedal stopper bolt F (3).

<table>
<thead>
<tr>
<th>Traveling speed at rated engine speed</th>
<th>Factory spec.</th>
<th>28.6 km/h 17.8 mph</th>

</thead>
</table>

<table>
<thead>
<tr>
<th>Length ( b ) of between HST pedal and stopper bolt F</th>
<th>Factory spec.</th>
<th>3 to 7 mm 0.12 to 0.28 in.</th>
</tr>
</thead>
</table>

6. If the measurement is not within factory specification, adjust by the cruise adjusting rod (5). (Cruise Linkage Adjustment)
7. Shorten the pedal stopper bolt R (2) to the position where the length of the bolt is not touched to the HST pedal (1) even if the HST pedal is fully depressed rearward.
8. Lengthen the length of the pedal stopper bolt R (2) gradually with the HST pedal fully depressed rearward and lengthen the three turn from the position where the head of the stopper bolt touches the HST pedal further.

(1) HST Pedal
(2) Pedal Stopper Bolt R
(3) Pedal Stopper Bolt F
(4) HST Pedal Mounting Screw
(5) Cruise Adjusting Rod

KiSC issued 02, 2007 A
**Adjusting Cruise Control Release Linkage**

1. Adjust the brake pedals play first.
2. Depress one of the brake pedals to make sure the cruise control is not released. Also depress both the brake pedals coupled together to make sure that the cruise control is released.
3. If the cruise control does not work as above adjust with release wire (1) as follows.
   - Check to see that the threaded portion of the wire (1) rear side is set at the end position. If not, set by lock nuts (2).
   - Adjust by lock nuts (4) for the center of the threaded portion of the release wire front side to come to the hook position.
   - Confirm whether to move as above-mentioned 2.
   - If not, adjust by lock nut (4).

**Draining the Transmission Fluid**

1. Place oil pans underneath the transmission case.
2. Remove the drain plugs (1).
3. Drain the transmission fluid.
4. Reinstall the drain plugs (1).

(When refilling)
- Fill up from filling port after removing the filling plug (2) until reaching the upper notch on the dipstick (3).
- After running the engine for few minutes, stop it and check the oil level again, add the fluid to prescribed level if it is not correct level.

<table>
<thead>
<tr>
<th>Transmission fluid</th>
<th>Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>45 L</td>
</tr>
<tr>
<td></td>
<td>11.9 U.S.gals</td>
</tr>
<tr>
<td></td>
<td>9.9 Imp.gals</td>
</tr>
</tbody>
</table>

**IMPORTANT**

- Use only KUBOTA SUPER UDT fluid. Use of other oils may damage the transmission or hydraulic system. Refer to “LUBRICANTS, FUEL AND COOLANT”. (See page G-7, 8.)
- Do not mix different brands of fluid together.

(A) Oil level is acceptable within this range.
Battery, Front Grill, Skirt and Bonnet
1. Open the bonnet and disconnect the battery negative cable.
2. Disconnect the head light connector and remove the front grill (4).
3. Remove the left and right side skirts (3).
4. Disconnect window washer hoses (2).
5. Remove the bonnet (1).

**NOTE**
- When disconnecting the battery cords, disconnect the negative cord first, when connecting, positive cord first.

Steering Joint, Brake Pedal Rod and Electric Wiring
1. Remove the tank frame support (2).
2. Remove the universal joint bolt (10) and steering joint support (3), and then remove the steering joint (1).
3. Disconnect the hand accelerator wire (7).
4. Disconnect the wiring connectors for engine stop solenoid (8), engine tachometer sensor (9) and glow plug.
5. Disconnect the heater hoses (4), and then reconnect their hoses to make loop.

**NOTE**
- Put a mark to each heater hose before disconnecting.
6. Disconnect the wiring connector for window washer tank (5) and compressor **1P** connector (6).
7. Disconnect the brake pedal rod.

**(When reassembling)**
- When accelerator wire is installed, adjust the wiring length as hit both the idling speed adjusting bolt and the maximum speed adjusting bolt by lever within the stroke of the accelerator lever.
- Set the steering joint (1) by the joint support (3) so that the steering wheel is turned lightly.
- Be sure to check and adjust the brake pedal free travel. (See page G-18.)

---

**Parts List**

- (1) Bonnet
- (2) Window Washer Hose
- (3) Skirt
- (4) Front Grill
- (5) Window Washer Tank
- (6) **1P** Connector
- (7) Accelerator Wire
- (8) Engine Stop Solenoid
- (9) Engine Tachometer Sensor
- (10) Universal Joint Bolt
**Clutch Rod, Brake Pedal Rod and Electric Wiring**

1. Disconnect the brake pedal rod (5) and clutch rod (4).
2. Disconnect the wiring connectors for alternator (1), coolant temperature sensor (9), oil pressure switch (2), fuel unit (3), starter motor (6) and battery.
3. Remove the clamps and ground earth of wiring harness and collect wiring harness to the step or cabin.
4. Remove the clamps (7) of A/C hoses (8). (A/C model only.)

*(When reassembling)*
- Be sure to check and adjust the clutch and brake pedal free travel. (See page G-18, 24.)

(1) Alternator  (6) Starter Motor  
(2) Oil Pressure Switch (7) Clamps  
(3) Fuel Unit (8) A/C Hoses  
(4) Clutch Rod (9) Coolant Temperature Sensor  
(5) Brake Pedal Rod

---

**Air Conditioner Parts**

1. Remove the muffler (2).
2. Remove the air conditioner belt (4) and remove the compressor (1) mounting screw.
3. Remove the recovery tank (6) and window washer tank (7).
4. Disconnect the air cleaner hose (8).
5. Disconnect the recovery tank hose (5).
6. Disconnect the radiator upper hose (3).
7. Remove the oil cooler mounting screw.
8. Remove the battery (10).
9. Remove the battery stay mounting bolt.
10. Take out the compressor (1), condenser (11), receiver (12), hoses (13), battery stay (9) and etc. as a unit.

*(When reassembling)*
- After reassembling the compressor, be sure to adjust the air conditioner belt tension. (See page G-29.)

KiSC issued 02, 2007 A
**Cruise Control Release Wire**
1. Disconnect the cruise control release wire (1).

*(When reassembling)*
- Be sure to adjust the cruise control release wire (1). (See page 3-S92.)

(1) Cruise Control Release Wire

**Seat, Seat Bracket and Lever Grips**
1. Remove the seat.
2. Disconnect the seat switch connector (3) and remove the seat bracket (1) with seat suspension (7).
3. Remove the lever grips for position control lever (2), front wheel drive lever (6), range gear shift lever (5) and cruise control lever (4).

(1) Seat Bracket  
(2) Position Control Lever  
(3) Seat Switch Connector  
(4) Cruise Control Lever  
(5) Range Gear Shift Lever  
(6) Front Wheel Drive Lever  
(7) Seat Suspension

**Electric Connector for HST**
1. Remove the lowering speed adjusting knob (4).
2. Disconnect the differential lock rod (2).
3. Disconnect the range gear shift lever sensor connector (3).
4. Disconnect the cruise switch connector (1).
5. Disconnect the HST pedal neutral switch connector (5).
6. Disconnect the ground earth (a).

(1) Cruise Switch Connector  
(2) Differential Lock Pedal  
(3) Range Gear Shift Lever Sensor Connector  
(4) Lowering Speed Adjusting Knob  
(5) HST Pedal Neutral Switch Connector  
(a) Ground earth is connected here
PTO Shift Wire and Electric Connector
1. Disconnect the PTO shift wire (2) at the PTO clutch valve lever (4).
2. Disconnect the traveling speed sensor connector (1).

(When reassembling)
- When connecting the PTO shift wire (2) to the lever (4), be sure to adjust the length of wire as follows.
1. Set the PTO shift lever to **OFF (Neutral)** position.
2. Loosen the lock nut (3) of wire, and connect wire to the clutch valve lever (4), and then place the wire to the hook.
3. Tighten the lock nut (3) clockwise (pull the wire), and lock the nut just before the lever moves.

<table>

Cabin Assembly
1. Remove the outer roof of cabin.
2. Support the cabin with nylon straps (1) and hoists.
3. Loosen and remove the cabin mounting bolts (2) and nuts (9).
4. Dismounting the cabin from tractor body.

**NOTE**
- Lift the cabin while making sure it does not catch on anything.

(When reassembling)
- Be sure to install the washers and mount rubbers, etc. in their original positions.

Hydraulic Pipes
1. Remove the main delivery pipe 1 (5).
2. Disconnect the main delivery pipe 2 (1) at the rear hydraulic block (6) and return pipe (2) at the mid case, and then remove the front hydraulic block (4) with pipes and bracket as a unit.
3. Remove the suction pipe (3) with oil filter (7).
4. Disconnect the oil cooler pipe (8) at the clutch housing.
5. Remove the brake rods (9).

(When reassembling)

Propeller Shaft
1. Slide the propeller shaft cover (4) and (8) after removing the screws (7).
2. Tap out the spring pins (2), (6) and slide the couplings (1), (5) and then remove the propeller shaft with covers (4), (8).

(When reassembling)
- Apply grease to the splines of propeller shaft 1 (3).
Separating Engine and Clutch Housing
1. Place the disassembling stand under the engine and clutch housing case.
2. Remove the fuel tank support mounting screws.
3. Remove the engine and clutch housing mounting screws and nuts.
4. Separate the engine and clutch housing while lifting up the tank frame.

(When reassembling)
• Apply grease to the spline of clutch shaft.
• Apply liquid gasket (Three Bond 1211 or equivalent) to joint face of the flywheel housing and clutch housing.

HST Linkage and Hydraulic Pipes
1. Disconnect the HST control rod (1) with the control lever (2).
2. Remove the charge delivery pipe 1 (3).
3. Remove the joint bolt (4) and disconnect the charge delivery pipe 2 (5) at the HST side.

(When reassembling)
• Be sure to adjust the HST neutral position. (See page 3-S90.)
• Install the copper washer securely.
Separating Clutch Housing and Mid Case
1. Remove the clutch housing and mid case mounting screws and nuts.
2. Separate the clutch housing and mid case.
   (When reassembling)
   • Be sure to install the gasket.
   • Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the clutch housing and mid case.

| Tightening torque | Clutch housing and mid case mounting nut | 102.9 to 117.6 N·m  |
|                  |                                           | 10.5 to 12.0 kgf-m   |
|                  |                                           | 75.9 to 86.8 ft-lbs  |
|                  | Clutch housing and mid case mounting screw | 77.5 to 90.2 N·m    |
|                  |                                           | 7.9 to 9.2 kgf-m     |
|                  |                                           | 57.1 to 66.5 ft-lbs  |
|                  | Clutch housing and mid case mounting stud bolt | 38.2 to 45.1 N·m   |
|                  |                                           | 3.9 to 4.6 kgf-m     |
|                  |                                           | 28.2 to 33.3 ft-lbs  |

Clutch Lever, Release Fork and Release Bearing
1. Remove the release fork mounting screws (2).
2. Draw out the clutch lever (3) to remove the release fork (1).
3. Remove the release bearing and release hub (4) together.
   (When reassembling)
   • Apply grease to the sliding surface of the clutch release hub.
   • Apply grease to the clutch lever.

| Tightening torque | Release fork mounting screw | 23.5 to 27.5 N·m |
|                  |                              | 2.4 to 2.8 kgf-m  |
|                  |                              | 17.4 to 20.3 ft-lbs |

(1) Release Fork   (3) Clutch Lever
(2) Release Fork Mounting Screw (4) Release Hub
Shaft Case, Input Shaft, Gear and Front Axle Drive Shaft

1. Remove the shaft case mounting screws.
2. Screw down the two M6 screws into the shaft case (4) and pull it out.
3. Take out the shaft case (4).
4. Take out the 24T gear shaft (3).
5. Take out the 26T gear (2).
6. Pull out the front axle drive shaft (1) to the rear side.

(When reassembling)
- Be sure to install the gasket.

(When replacing oil seal in shaft case)
- Install the oil seal (5) as shown in the figure, noting its direction.
- Apply grease to the oil seal (5).
- Install the front axle drive, shaft (1) from front side after assembling the clutch housing case (HST unit) and mid case. Then install the bearing (8), sleeve (9), collar (10), oil seal (7), internal snap ring (6), O-ring (11) and spacer (12) in order.

HST Servo Pipe (Bypass Pipe)

1. Remove the servo pipe (1).

(1) Servo Pipe
(2) HST Unit (Clutch Housing)
(3) HST Servo Regulator

KiSC issued 02, 2007 A
Port Block
1. Remove the port block mounting hex. head screws.
2. Pull and remove the port block (1) from the HST housing.
(When reassembling)
   • Install port block with O-ring (5), valve plates and gasket in place.
   
   IMPORTANT
   • Valve plates (2), (3) may stick to the port block but they are not fixed. Take care not to drop them.
   And these valve plates are not interchangeable

Cylinder Block Assemblies
1. Remove both motor and pump cylinders (1), (2) with pistons.
(When reassembling)
   • Apply clean hydrostatic transmission oil to cylinder blocks.

   NOTE
   • Take care not to damage the surface of cylinder blocks and pistons.
   • Do not interchange pistons between pump and motor cylinder block.

| (1) Motor Cylinder Block | (2) Pump Cylinder Block |

Motor Shaft
1. Remove the motor swashplate setting hex. head screw (1).
2. Remove the motor swashplate (3) and motor shaft (4).
(When reassembling)
   • Be sure to install the thrust plate to swashplate (3).
   • When installing the swashplate to clutch housing (HST body), be sure to align the hole (2) of swashplate and straight pin (5).
   • Apply clean transmission oil to the thrust plate.

Swashplate and Pump Shaft
1. Remove the swashplate (1).
2. Remove the cradle bearing bracket mounting hex. head screws (6).
3. Tap the pump shaft (3) with a plastic hammer slightly to slide out it with cradle bearing bracket (5) to the rear side.

(When reassembling)
- Place the swashplate (1) into the housing, align the slot guide (4) of swashplate and groove (2) of servo piston.
- Apply clean transmission oil to the surface of swashplate and cradle bearing.

<table>

W1017976
Charge Relief Valve
1. Remove the hex. head plug (1).
2. Remove the spring guide (3), shim (2), spring (4) and valve poppet (5).

(When reassembling)

■ NOTE
- Install valve component, noting the number of shims (2) in the charge relief valve.
- Take care not to damage the O-ring.
- When replacing the valves, check and adjust the setting pressure. (Refer to page 3-S88.)

<table>

(1) Servo Piston Under Cover   (2) Servo Piston Assembly

W1019685

1) Checking and Adjusting HST Neutral Position

CAUTION
- Park the tractor on a flat place and keep all the levers at neutral position.
- Jack up the engine tractor and bring it in the 2WD mode.

1. Fit the HST mechanism first and then exterior components until the engine can get started.
2. Remove the hex. socket head plug from F and R ports.
3. Assemble adaptor 58 (07916-52391) and thread joint (07916-50341) with the gasket between them.
4. Install the assembled adaptor 58 and thread joint F and R ports.
5. Measure the low and high HST charge pressures. Place 5 MPa (50 kgf/cm², 725 psi) gauges on the two spots in the photo.
6. Lift the entire steps, as shown below, so that the piston can be adjusted.
7. If any of the servo piston parts has been replaced, readjust the HST neutral position, referring to the dimension A of the servo piston adjusting screw (1).
8. Start the engine and measure the low and high charge pressures. Now adjust the piston neutral position so that the low-side pressure and the high-side one be the same. (Take the measurement with the engine rpm at MAX.) Move the servo valve lever (2) and watch the tires’ movement to ensure the neutral positioning.
9. Finally lock the piston adjusting nut and fit the exterior components.

Charge pressure (Oil temperature 50 to 60 °C (122 to 140 °F))

**NOTE**
- For the disassembling procedure from “Draining the Transmission Fluid” to “Step and Floor Seat” or “Cabin Assembly”, refer to page 3-S92 to 3-S96.

**Hydraulic Pipes**

1. Remove the HST control rod (4).
2. Remove the brake rods (2), (13).
3. Remove the main delivery pipe 1 (6).
4. Disconnect the main delivery pipe 2 (1) at the rear hydraulic block (9) and return pipe (3) at the mid case, and then remove the front hydraulic block (8) with pipes and bracket as a unit.
5. Remove the suction pipes (7) with oil filter (11).
6. Remove the charge delivery pipe 1 (12).
7. Remove the charge delivery pipe 2 (10).

**(When reassembling)**
- Install the copper washer securely.

HST Linkages
1. Remove the cruise adjusting rod (3).
2. Disconnect the neutral rod (5) from connecting shaft (2).
3. Disconnect the damper (6) from neutral holder arm (9).
4. Remove the neutral rod (5), neutral holder (9) and neutral holder arm (10) as a unit.
5. Disconnect the cruise spring (8), and remove the damper stay (7) with damper (6).
6. Remove the cruise release wire (1).

(When reassembling)
- When installing the cruise wire (1) to the damper bracket (7) set the lock nuts (4) so that the threaded position of wire (1) becomes end.
- Be sure to check the cruise wire releasing. (See page 3-S92.)
- Be sure to adjust the HST neutral position. (See page 3-S90.)

Separating Mid Case and Transmission Case
1. Separate the mid case and transmission case after removing their mounting screws.

(When reassembling)
- Confirm to insert the PTO shaft to PTO clutch firmly, turning the PTO shaft.
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the mid case and transmission case.

| Tightening torque | Mid case and transmission case mounting screw | 77.5 to 90.2 N·m
|                  |                                             | 7.9 to 9.2 kgf·m
|                  |                                             | 57.1 to 66.5 ft-lbs
|                  | Mid case and transmission case mounting nut | 102.9 to 117.6 N·m
|                  |                                             | 10.5 to 12.0 kgf·m
|                  |                                             | 75.9 to 86.8 ft-lbs
|                  | Mid case and transmission case mounting stud bolt | 39.2 to 49.0 N·m
|                  |                                             | 4.0 to 5.0 kgf·m
|                  |                                             | 28.9 to 36.2 ft-lbs

Separating Mid Case
1. Separate the mid case from the clutch housing after removing their mounting screws.

(When reassembling)
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of clutch housing and mid case.
- Be sure to install the gasket.

| Tightening torque | Clutch housing and mid case mounting screw | 77.5 to 90.2 N·m
|                  |                                             | 7.9 to 9.2 kgf·m
|                  |                                             | 57.1 to 66.5 ft-lbs
|                  | Clutch housing and mid case mounting nut | 102.9 to 117.6 N·m
|                  |                                             | 10.5 to 12.0 kgf·m
|                  |                                             | 75.9 to 86.8 ft-lbs
|                  | Clutch housing and mid case mounting stud bolt | 38.2 to 45.1 N·m
|                  |                                             | 3.9 to 4.6 kgf·m
|                  |                                             | 28.2 to 33.3 ft-lbs
PTO Clutch Valve

1. Remove the PTO clutch valve (2) as a unit.
2. Pull out the pipe (1).

(When reassembling)
- Apply small amount of grease for the O-ring (3).
- Install the pipe (1) to the hole (4) of the PTO clutch valve (2) firmly.
- Replace the pipe (1) with new one.

Pipe (1)  PTO Clutch Valve (2)  O-ring (3)  Hole (4)

Mid Case Bearing Holder with Gears

1. Remove the mid case bearing holder 1 (5).
2. Take out the gear shafts (4), (8), (7), (6).
3. Remove the PTO drive shaft (1).
4. Remove the mid case bearing holder 2 (2) with PTO clutch (10).

(When reassembling)
- Tap in the mid case bearing holder (2), (5) with plastic hummer until contact to mid case, and then tighten the screws to specified torque.

Disassembling PTO Clutch

1. See page 3-S32, S33.

(C) Transmission Case

■ NOTE
- For the disassembling procedure from “Draining the Transmission Fluid” to “Step and Floor Seat” or “Cabin Assembly”, refer to page 3-S92 to 3-S96.

Rear Wheel

1. Place disassembling stand under the transmission case, and support it with a jack.
2. Remove the rear wheels.
3. After removing the rear wheels, support it at both sides of rear axle by stands.

(When reassembling)

**ROPS, 3 Point Linkages, Hydraulic Cylinders and Others**

1. Remove the top link.
2. Remove the lift rods (2), lower links (5) and check chains (1) as a unit.
3. Remove the PTO shaft cover (4).
4. Remove the drawbar frame (6).
5. Disconnect the hydraulic cylinder hoses (7) and return hoses (9) at the rear hydraulic block (8).
6. Remove the two pins and remove the hydraulic cylinders (3).
7. Disconnect the brake rods.

*(When reassembling)*
- Apply grease to the lower link pins and hydraulic cylinder pins.

**Hydraulic Pipes**

1. Remove the brake rods (1).
2. Remove the charge delivery pipe 2 (2).
3. Remove the joint bolt (3) for main delivery pipe 2.

*(When reassembling)*
- Install the copper washer securely.

<table>

*(1) Brake Rod                     (3) Joint Bolt for Main Delivery Pipe 2*
*(2) Charge Delivery Pipe 2*
HST Linkages
1. Remove the cruise adjusting rod (3).
2. Disconnect the neutral rod (5) from connecting shaft (2).
3. Disconnect the damper (6) from neutral holder arm (9).
4. Remove the neutral rod (5), neutral holder (9) and neutral holder arm (10) as a unit.
5. Disconnect the cruise spring (8), and remove the damper stay (7) with damper (6).
6. Remove the cruise release wire (1).

(When reassembling)
- When installing the cruise wire (1) to the damper bracket (7) set the lock nuts (4) so that the threaded position of wire (1) becomes end.
- Be sure to check the cruise wire releasing. (See page 3-S92.)
- Be sure to adjust the HST neutral position. (See page 3-S90.)

Cruise Linkage, Rear Hydraulic Block and Lift Arm Bracket
1. Remove the cruise lever rod (7) and release spring (8).
2. Remove the cruise assembly mounting screws (Three screws) and remove the cruise assembly (1).
3. Remove the range gear shift lever rod and remove the range gear shift lever sensor (2) with stay.
4. Remove the external snap ring and remove the range gear shift lever (5) and cruise control lever (4).
5. Remove the rear hydraulic block (3), cover and lift arm support (6) as a unit.

(When reassembling)
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the differential case and cover.
- Be sure to check cruise lever operation force and cruise control linkage. (See page 3-S90.)
**Rear Axle**

1. Separate the rear axle case from brake case.

*(When reassembling)*

- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the rear axle and brake case.

**Brake Case**

1. Remove the range gear shift lever and its fulcrum screw.
2. Remove the brake case mounting screws and nuts.
3. Separate the brake case, tapping the brake case lever lightly.

*(When reassembling)*

- Apply grease to the steel ball seats. (Do not grease excessively.)
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the brake case and transmission case.
- Be sure to apply liquid gasket to A position.
- Be sure to fix the brake cam and cam plate.
- Before installing the brake case to the transmission case, install the cam plate to the transmission case.

Separating Mid Case and Transmission Case

1. Separate the mid case and transmission case after removing their mounting screws and nut.

**When reassembling**
- Confirm to insert the PTO shaft to PTO clutch firmly, turning the PTO shaft.
- Confirm to insert the front wheel drive shaft to coupling firmly.
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the mid case and transmission case.

Pinion Bearing Cover

1. Remove the stake of lock nut (5).
2. Lock the turning of spiral bevel pinion and remove the lock nut (5).
3. Remove the pinion bearing case mounting screws.
4. Take out the pinion bearing cover (4) and shims (1).

**When reassembling**
- Make sure of the number of shims in the pinion bearing case.
- Replace the lock nut (5) with a new one, and stake the lock nut firmly after installing the parts on the shaft.

Transmission Bearing Holder

1. Remove the transmission bearing holder mounting screws.
2. Tap out the spring pin (8) on the shift fork rod (3).
3. Jack up the bearing holder (1) by using the two jack screws (5) until the taper roller bearing (7) can be removed.

■ NOTE
- Jack up the bearing holder while hitting the two shafts (2) (4) by copper hummer or soft hummer.
4. Jack up more and remove the transmission bearing holder (1).

(When reassembling)
- Tap in the transmission bearing holder with soft hummer until contact to transmission case, and then tighten the screws to specified torque.
- Tap in the spring pin (8) so that its split portion may face forward. (Refer to figure.)

KiSC issued 02, 2007 A
Shaft Assemblies
1. Remove the traveling speed sensor (1).
2. Take out the spiral bevel pinion shaft assembly (4) with shift fork (6), range gear shaft assembly (5) and PTO drive shaft assembly (3).
3. Take out the front wheel drive shaft (2).
(When reassembling)
- Apply transmission fluid to needle bearings (12).
**Differential Lock Shift Fork**
1. Tap out the left side spring pin (4).
2. Remove the cotter pin and take out the clevis pin (3).
3. Draw out the differential lock fork shaft (1) and take out the differential lock shift fork (2).

*(When reassembling)*
- Apply grease to the left and right oil seals on the transmission case.
- Insert the clevis pin (3) from the top and install the washer and cotter pin.
- Tap in the spring pin (4) so that its split portion a may face outward as shown in the figure.

![Diagram](image1)

(1) Differential Lock Fork Shaft  
(2) Differential Lock Shift Fork  
(3) Clevis Pin  
(4) Spring Pin  

**PTO Shaft**
1. Remove the PTO shaft cover.
2. Remove the bearing case mounting screws, and draw out the PTO shaft (1) with bearing case (2).
3. Remove the internal snap ring (3).
4. Top out the PTO shaft (1) to the front.

*(When reassembling)*
- If the lock nut (6) was removed, replace it with a new one. After replacing, be sure to stake it firmly.
- Install the slinger (7) firmly.
- Apply grease to the oil seal (4) and install it, noting its direction.

![Diagram](image2)

| Tightening torque          | Lock nut             | 147 to 196 N·m

(7) Slinger  

**Differential Gear Assembly**
1. Remove the differential support, noting the number of left shims.
2. Take out the differential gear assembly, noting the number of right shims.

*(When reassembling)*
- Check the spiral bevel gear for wear or damage. If it is no longer serviceable, replace it. Then, also replace the spiral bevel pinion.
- Use same number of shims as before disassembling.

(3) Servicing

(A) Bearing, Gear and Shaft

See page 3-S43.

(B) PTO Clutch

See page 3-S45.

(C) Differential Gears

See page 3-S46 to 3-S48.

(D) HST

Charge Pump

1. Check the charge pump housing and the rotor (1), (2) for scratches and wear.
2. If scratch or worn, replace the charge pump complete assembly.

(1) Inner Rotor
(2) Outer Rotor

W1025956

Pump Shaft and Motor Shaft

1. Check the seal surface (4) and the bearing surface (3).
2. If the shaft is rough or groove, replace it.

(1) Motor Shaft
(2) Pump Shaft
(3) Bearing Surface
(4) Seal Surface

W1026037

Cylinder Block Bore and Pistons

1. Lift the pistons gently with the retainer plate (1).
2. Check the pistons for their free movement in the cylinder block bores.
3. If the piston or the cylinder block bore is scored, replace cylinder block assembly.

■ IMPORTANT

• Do not interchange pistons between pump and motor cylinder block.

(1) Retainer Plate
(2) Piston
(3) Cylinder Block

W1026142

Piston Slipper

1. Check the slipper (1) for flatness.
2. If rounded, replace.
3. Measure the thickness of piston slipper.
4. If the measurement is less than the allowable limit, replace.
5. Check the lubricant hole (2) for clogging.

■ IMPORTANT

• Do not interchange pistons between pump and motor cylinder block.

(1) Piston Slipper
(2) Lubricant Hole

W1026561
**Cylinder Block Face**

1. Check the polished face (1) of cylinder block for scoring.
2. If scored, replace cylinder block assembly.
3. Check the spring (2) for breakage.
4. If broken, replace cylinder block assembly.

(1) Polished Face  (2) Spring

**Valve Plate**

1. Check the engagement of the valve plate (2), (3) and the anchor pin (1).
2. Pushing the valve plate against the anchor pin, lift it to remove.
3. Check the valve plate for foreign particles.
4. Clean the valve plate and dry with compressed air.
5. Check the valve plate for scratches, wear and erosion. (Run a finger nail across the valve plate surface. If worn, it will be felt.)
6. If worn or scored, replace.

**NOTE**
- After checking, coat them with transmission oil.
- Valve plates are not interchangeable.

(1) Anchor Pin  (2) Valve Plate (Pump)  (3) Valve Plate (Motor)

**Thrust Plate, Swashplate and Cradle Bearing**

1. Check the thrust plate (1) for scratches and excessive wear.
2. If worn or scored, replace
3. Check the piston contact face of swashplate (2) for scratched and excessive wear and check the holes (3) of swashplate (2) for clogged.
4. If worn or scored, replace and if holes are clogged, clean them.
5. Check the surface of cradle bearings (4) for scratches and excessive wear.
6. If worn or scored, replace.

(1) Thrust Plate  (2) Swashplate  (3) Hole  (4) Cradle Bearing  (5) Cradle Bearing Bracket

**Oil Seals and Bearing for Shaft**

1. Remove the internal snap ring and check the oil seals (2) for damage.
2. Check the bearings (1) for wear.
3. If the bearings are worn, replace.

**NOTE**
- After checking, coat the bearing with transmission oil and the oil seal lip with grease.

(1) Needle Bearing  (2) Oil Seal
Check and High Pressure Relief Valve
1. Check the valve plug (1) and valve (3), (4) for scratches and damage.
2. Check the valve seat in the port block for damage.
3. Check the spring (2) for breakage and wear.
4. If anything unusual, replace the check and high pressure relief valve assembly.

(1) Valve Plug  (4) Check and High Pressure Relief Valve Assembly (Reverse)
(2) Spring  (3) Check and High Pressure Relief Valve Assembly (Forward)

Charge Relief Valve
1. Check the spring guide (3), spring (2) and valve poppet (1) for scratches, breakage and damage.
2. If anything unusual, replace.

**NOTE**
- When re-installing the charge relief valve, never change the number of shims.
- If replace with new one, be sure to check and adjust the setting pressure. (See page 3-S88.)

(1) Valve Poppet  (3) Spring Guide
(2) Spring  (4) Plug for Charge Relief Valve

Servo Piston
1. Check the surface of servo piston for scratches and excessive wear.
2. If worn or scored, replace the servo piston assembly.

(1) Servo Piston Assembly
4 REAR AXLE
CONTENTS

1. STRUCTURE ........................................................................................................... 4-M1
1. STRUCTURE

[L3130, L3430, L3830, L4630]

The final gear (9) are final reduction mechanism which further reduces the speed of rotation. The direction of power transmitted is changed by the differential gear.

The rear axles (2) are the final transmission mechanism which transmit the power from the transmission to the rear wheels. The rotation speed is reduced by the final gears (9).

The rear axles are the semi-floating type with the ball bearing (1) between the rear axle (2) and rear axle case (3), which support the rear wheel load besides transmitting power to the rear wheel. The rear axles also support the weight of the tractor.

3. CHECKING, DISASSEMBLING AND SERVICING

[1] DISASSEMBLING AND ASSEMBLING

(1) Separating Rear Axle Case from Brake Case

Draining the Transmission Fluid
1. Place oil pans underneath the transmission case.
2. Remove the drain plugs (1).
3. Drain the transmission fluid.
4. Reinstall the drain plugs (1).

(When refilling)
- Fill up from filling port after removing the filling plug (2) until reaching the upper notch on the dipstick (3).
- After running the engine for few minutes, stop it and check the oil level again, add the fluid to prescribed level if it is not correct level.

<table>

</tbody>
</table>

■ IMPORTANT
- Use only KUBOTA SUPER UDT fluid. Use of other oils may damage the transmission or hydraulic system. Refer to “LUBRICANTS, FUEL AND COOLANT”. (See page G-7, 8.)
- Do not mix different brands of fluid together.

(1) Drain Plugs  (2) Filling Plug  (3) Dipstick  (A) Oil level is acceptable within this range.
Rear Wheel and ROPS (ROPS Model)
1. Place the disassembling stand under the transmission case.
2. Remove the rear wheel mounting screws and nuts.
3. Remove the rear wheels.
4. Remove the top link (2) and lift rod (4).
5. Disconnect the check chain (6) and remove the lower link (5).
6. Remove the ROPS lower frame mounting screws (7), (8).
7. Dismount the ROPS assembly (1), (3).

(When reassembling)
- Be sure to install the washers, plate and mount rubbers, etc. in their original positions.

Rear Wheel and Cabin Mount Screw (Cabin Model)
1. Place the disassembling stand under the transmission case.
2. Remove the rear wheel mounting screws and nuts.
3. Remove the rear wheels.
4. Remove the top link (1) and lift rod (2).
5. Disconnect the check chain (4) and remove the lower link (3).
6. Place a block of wood (5) between cabin and lift arm (6) to support the cabin.
7. Remove the cabin mount bracket mounting bolt (8) and nut.

(When reassembling)
- Be sure to install the washers, plate and mount rubbers, etc. in their original positions.

(2) Disassembling Rear Axle

Rear Axle

1. Remove the ball bearing (9) with a puller.
2. Remove the stake of lock nut (8).
3. Secure the rear axle (1) in a vise and remove the lock nut.
4. Take out the gear (7) and spacer (5).
5. Tap out the rear axle (1).
6. Remove the rear axle cover (11). (L5030 only)

**When reassembling**

- Apply grease to the oil seal (2) and install it.
- Replace the lock nut with new one, and after tightening it to specified torque, stake it firmly.
- Assemble the oil seal (2) with correct direction. (See figure.)

1. LINKAGE

(1) Brake Pedal Turnbuckle Rod  (4) Brake Cam Lever  (7) Brake Plate  (9) Parking Brake Cable
(2) Brake Pedal  (5) Parking Brake Turnbuckle Rod  (8) Cam Plate  (10) Parking Brake Lever
(3) Brake Rod  (6) Brake Disc
2. OPERATION

The brakes are provided on the power transmitting shafts (brake shafts (8)) through which power is transmitted to the final reduction system. The brakes are incorporated in the brake case (1) filled with transmission oil. They are designed to brake when the brake discs (2), spline-coupled and rotating with the brake shaft, are pressed against the brake case by cam plate (3) with the cam mechanism incorporating steel balls (4). For greater braking force, two brake discs are provided respectively, and the plate (6) fixed to the brake case are arranged between the brake discs.

**During Braking**

When the brake pedal is pressed, the force causes the brake cam lever (5) to move in the direction of allow through the brake rod. At the same time, the brake cam (7) spline-couples with the brake cam lever also moves. Due to this force, cam plate (3) moves in the direction of arrow. Since the steel balls (4) are set in the grooves of differential case, cam plate (3) is pushed out against the brake discs (2), causing braking with the friction force created.

4. CHECKING, DISASSEMBLING AND SERVICING

[1] BRAKE PEDAL

(1) Checking and Adjusting

Checking Brake Pedal Free Travel

⚠️ CAUTION

- Stop the engine and chock the wheels before checking brake pedal.

1. Release the parking brake.
2. Slightly depress the brake pedals and measure free travel \( L \) at top of pedal stroke.
3. If the measurement is not within the factory specifications, loosen the lock nut (1) and turn the turnbuckle (2) to adjust the rod length within acceptable limits.
4. Retighten the lock nut (1) securely.

<table>
<thead>
<tr>
<th>Brake pedal free travel “L”</th>

</tr>
</thead>
<tbody>
<tr>
<td>(1) Lock Nut</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(2) Turnbuckle</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Parking Brake Lever Free Play

⚠️ CAUTION

- Stop the engine and chock the wheels before checking parking lever.

1. Release the parking brake lever (1).
2. Measure the length of \( L \).
3. Confirm there is free play in a right and left parking brake rod (3).
4. Adjust the parking brake rod (3) length to become the same when right and left free play is different at that time.
5. Pull the parking lever (1) by one notch. At that time confirm there is no free play in the parking brake rods.
6. Adjust the parking brake cable (2) if there is free play in the parking brake rod (3).

(Reference)

Brake Pedal and Brake Rod

1. Remove the brake rods (12), (14).
2. Remove the brake pedal rods (11), (13).
3. Disconnect the clutch pedal rod.
4. Remove the external snap ring (2).
5. Tap out the spring pin (7) and pull out the brake pedal shaft (10) with clutch pedal (9).
6. Remove the brake pedals (5), (8) and springs (6).
7. Remove the parking brake lever (1).
(3) Servicing

Clearance between Brake Lever Link Shaft and Bushing
1. Measure the brake lever link shaft O.D. with an outside micrometer.
2. Measure the brake lever link bushing I.D. with a cylinder gauge.
3. Calculate the clearance.
4. If the clearance exceeds the allowable limit, replace the bushing.

<table>
<thead>
<tr>

[2] BRAKE CASE

(1) Disassembling and Assembling

Draining the Transmission Fluid
1. Place oil pans underneath the transmission case.
2. Remove the drain plugs (1).
3. Drain the transmission fluid.
4. Reinstall the drain plugs (1).

(When refilling)
- Fill up from filling port after removing the filling plug (2) until reaching the upper notch on the dipstick (3).
- After running the engine for few minutes, stop it and check the oil level again, add the fluid to prescribed level if it is not correct level.

<table>

</tbody>
</table>

■ IMPORTANT
- Use only KUBOTA SUPER UDT fluid. Use of other oils may damage the transmission or hydraulic system. Refer to “LUBRICANTS, FUEL AND COOLANT”. (See page G-7, 8.)
- Do not mix different brands of fluid together.

(1) Drain Plugs  (2) Filling Plug  (3) Dipstick  (A) Oil level is acceptable within this range.
Rear Wheel and ROPS (ROPS Model)
1. Place the disassembling stand under the transmission case.
2. Remove the rear wheel mounting screws and nuts.
3. Remove the rear wheels.
4. Remove the top link (2) and lift rod (4).
5. Disconnect the check chain (6) and remove the lower link (5).
6. Remove the ROPS lower frame mounting screws (7), (8).
7. Dismount the ROPS assembly (1), (3).

(When reassembling)
- Be sure to install the washers, plate and mount rubbers, etc. in their original positions.

Rear Wheel and Cabin Mount Screw (Cabin Model)
1. Place the disassembling stand under the transmission case.
2. Remove the rear wheel mounting screws and nuts.
3. Remove the rear wheels.
4. Remove the top link (1) and lift rod (2).
5. Disconnect the check chain (4) and remove the lower link (3).
6. Place a block of wood (5) between cabin and lift arm (6) to support the cabin.
7. Remove the cabin mount bracket mounting bolt (8) and nut.

(When reassembling)
- Be sure to install the washers, plate and mount rubbers, etc. in their original positions.

Rear Axle Case
1. Disconnect the brake rod.
2. Disconnect the parking brake rod and parking brake cable (left side only).
3. Place the disassembling stand under the rear axle case.
4. Remove the rear axle mounting screws and nuts.
5. Separate the rear axle case from brake case.

(When reassembling)
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the rear axle case and brake case.
- Be sure to check and adjust the parking brake lever free play (see page 5-S4).

**Brake Case**

1. Disconnect the brake rod (1).
2. Place a block of wood (5) between floor seat (4) and lift arm (6) to support the floor seat. (ROPS model)
3. Place the floor seat mounting bolts and nuts. (ROPS model)
4. Remove the floor seat support (3). (ROPS model)
5. Remove the fulcrum shaft (2) and disconnect the levers. (Left side only)
6. Remove the brake case mounting screws and nuts.
7. Remove the brake case (7).

**(When reassembling)**

- Place the brake discs (10) so that the hole “A” of brake discs should be overlapped 50% or more.
- Apply liquid gasket (Three Bond 1208D or equivalent) to joint face of the brake case and differential gear case.
- Be sure to apply the liquid gasket to a position.
- Apply grease to the steel ball seats. (Do not grease excessively.)
- Be sure to fix the brake cam (13) and cam plate (9).
- Before installing the brake case to the transmission case, install the cam plate (9) to the transmission case.

(2) Servicing

Brake Cam Lever Movement
1. Assemble the brake cam (1) and brake cam lever (2).
2. Move the brake cam lever by hand to check the movement.
3. If the movement is heavy, refine the brake cam lever or brake case with sandpaper.

Cam Plate Flatness
1. Place the cam plate on the surface plate.
2. Measure the flatness of cam plate with a feeler gauge at four points on a diagonal line.
3. If the measurement exceeds the allowable limit, replace it.

Height of Cam Plate and Ball
1. Measure the dimension of the cam plate with the ball installed.
2. If the measurement is less than the allowable limit, replace the cam plate and balls.
3. Inspect the ball holes of cam plate for uneven wear. If uneven wear is found, replace it.

Brake Disc Wear
1. Measure the brake disc thickness with vernier calipers.
2. If the measurement is less than the allowable limit, replace it.

Plate Wear
1. Measure the plate thickness with vernier calipers.
2. If the measurement is less than the allowable limit, replace it.

6 FRONT AXLE
CONTENTS

1. STRUCTURE ................................................................................................. 6-M1
1. STRUCTURE
(for L3130, L3430, L3830 and L4630)

The front axle of the 4WD is constructed as shown above. Power is transmitted from the transmission through the propeller shaft (23) and to the bevel pinion shaft (14), then to the spiral bevel gear (13) after that to the differential gear.

The power through the differential is transmitted to the differential yoke shaft (19), and to the bevel gear shaft (17) in the bevel gear case (6).

The revolution is greatly reduced by the bevel gears (15), (4), then the power is transmitted to the axle (1).

The differential system allows each wheel to rotate at a different speed to make turning easier.

</tbody>
</table>
4. CHECKING, DISASSEMBLING AND SERVICING

[1] CHECKING AND ADJUSTING

Toe-in
1. Park the tractor on the flat place.
2. Inflate the tires to the specified pressure.
3. Turn steering wheel so front wheels are in the straight ahead position.
4. Lower the implement, lock the parking brake and stop the engine.
5. Measure distance between tire beads at front of tire, hub height.
6. Measure distance between tire beads at rear of tire, hub height.
7. Front distance should be 2 to 8 mm (0.08 to 0.32 in.) less than rear distance.
8. If the measurement is not within the factory specifications, adjust by changing the tie-rod length.

| Toe-in (B - A) | Factory spec. | 2 to 8 mm | 0.08 to 0.32 in. |

Adjusting
1. Detach the snap ring (3).
2. Loosen the tie-rod lock nut (1).
3. Turn the tie-rod joint (2) to adjust the rod length until the proper toe-in measurement is obtained.
4. Retighten the tie-rod lock nut (1).
5. Attach the snap ring (3).

Important
- A right and left tie-rod joint is adjusted to the same length.

<table>

<td></td>
</tr>
</tbody>
</table>

Axial Sway of Front Wheel
1. Jack up the front side of tractor.
2. Set a dial gauge on the outside of rim.
3. Turn the wheel slowly and read the runout of rim.
4. If the measurement exceeds the factory specifications, check the bearing, rim and front wheel hub.

| Axial sway of front wheel | Factory spec. | Less than 5.0 mm | 0.197 in. |

W10120920

KiSC issued 02, 2007 A
Adjusting Front Axle Pivot
1. Jack up the tractor body, then loosen the lock nut (2).
2. Measure the adjusting screw tightening torque.
3. If tightening torque is not within the factory specifications, adjust the adjusting screw (1).
4. After adjustment, tighten the lock nut firmly.

(When reassembling)

Front Wheel Steering Angle (for L5030)
1. Inflate the tires to the specified pressure.
2. Steer the wheels to the extreme right until the front gear case (1) contacts with the bevel gear case (2) at right hand side of the front axle.
3. If the front gear case (1) can not be contacted with the bevel gear case (2), shorten the length of stopper (3).
4. Keeping the front gear case (1) contact with the bevel gear case (2), make a specified clearance (A) as shown in the lower table.
5. After adjustment, secure the stopper with the lock nut (4).
6. For adjusting the left steering angle, perform the same procedure as mentioned in right steering angle.

Front Wheel and Front Axle Assembly
1. Check the front axle and engine are securely mounted on the disassembly stand.
2. Loosen the front wheel mounting nuts.
3. Lift the front axle and remove the front wheels.
4. Remove the bracket (front) mounting screws and nuts.
5. Remove the bracket (rear) mounting screws and nuts.
6. Separate the front axle from front axle bracket.

(When reassembling)

■ IMPORTANT
   • Be sure to adjust the front axle rocking force.  
   (See page 6-S6.)

| Tightening torque          | Front wheel mounting nut | 137 N·m |
|                           |                         | 14.0 kgf·m |
|                           |                         | 100 ft-lbs |

|                           |                         | 7.9 to 9.2 kgf·m |
|                           |                         | 57.2 to 66.5 ft-lbs |

Draining Front Axle Case Oil
1. Place oil pans underneath the front axle case.
2. Remove the drain plug (3) both sides and filling port plug (2) to drain the oil.
3. After draining, reinstall the drain plugs (3) and filling port plug (2).

(When reassembling)
   • Remove the filling port plug (2) and right and left check plugs (1).
   • Fill with the new oil.
   • After filling, reinstall the filling port plug (2).

■ IMPORTANT
   • Use KUBOTA SUPER UDT fluid or SAE80, 90 gear oil.  
   Refer to “LUBRICANTS, FUEL AND COOLANT”.  (See page G-7, 8.)

(1) Check Plug      (2) Filling Port Plug      (3) Drain Plug
Propeller Shaft
1. Slide the propeller shaft cover (4) and (8) after removing the screws (7).
2. Tap out the spring pins (2), (6) and slide the couplings (1), (5) and then remove the propeller shaft with covers (4), (8).

(When reassembling)
- Apply grease to the splines of propeller shaft 1 (3).

Tie-rods
1. Pull out the cotter pin and remove the tie-rod end slotted nuts.
2. Remove the tie-rod with a tie-rod end lifter (Code No. 07909-39051).

(When reassembling)
- After tightening the tie-rod end nut to the specified torques, install a cotter pin as shown in the figure left.

Spiral Bevel Pinion Shaft and Differential Gear Assembly
1. Take out the differential yoke shaft (9), (10) both sides.
2. Remove the oil seal (6) and internal snap ring (5).
3. Remove the collar (4).
4. Remove the spiral bevel pinion shaft (3) by the pinion shaft remover (14).
5. Take out the differential gear assembly (2), ball bearing (7) and shim (8) from left side of front axle case (1).
6. Remove the stake of lock nut (11), and then remove the lock nut (11).
7. Remove the taper roller bearings (12).

(When reassembling)
- Replace the lock nut (11) and oil seal (6) with new ones.
- Apply grease to the oil seal (6).
- Install the shims and collars to their original position.
- Install the taper roller bearings correctly, noting their direction and apply gear oil to them.
- Tighten up the lock nut (11) until the turning force of the spiral bevel pinion shaft reaches the factory specification. (See page 6-S16.)
- When press-fitting an oil seal (6), observe the dimension “A” described in the figure.

■ IMPORTANT
- After adjusting the turning torque stake the lock nut (11) firmly.

■ NOTE
- After turning torque adjustment, be sure to stake the lock nut.

(1) Collar (2) Lock Nut
Backlash between Spiral Bevel Pinion Shaft and Spiral Bevel Gear
1. Set a dial gauge (lever type) with its finger on the spline of spiral bevel pinion shaft.
2. Measure the backlash by moving the spiral bevel pinion shaft by hand lightly.
3. If the backlash is not within the factory specifications, change the adjusting collar (3), (4).
   For example, when the backlash is too large, change the collar (3) to thinner one and change the collar (4) to thicker one. At this time, if the collar (3) is thinned by 1 mm, the collar (4) must be thickened by 1 mm.

(Reference)
- Standard size of adjusting collar (3), (4) : 6.0 mm (0.236 in.) of thickness (total 12.0 mm)
- Standard size of adjusting shim (5) : 2.0 mm (0.079 in.) of thickness
4. Adjust the backlash properly by repeating the above procedures.

1. STRUCTURE

The full hydrostatic type power steering is used on these tractors. This steering system is composed of steering wheel, steering joint shafts, steering controller, steering cylinder and other components shown in the figure.
2. HYDRAULIC CIRCUIT

When the engine starts, the hydraulic pump (8) pressure-feeds the oil, drawn from the transmission case (7) through the oil filter (6), to the steering controller (3).

The oil which has entered steering controller (3) is directed to control valve (10).

As the steering wheel is turned, control valve (10) operates and the oil passes through gerotor (1) and into steering cylinder (2). The cylinder rod then moves to control the directional movement of the front wheels.

Return oil from steering cylinder (2) passes through control valve (10) is sent to the PTO clutch valve, HST, GST valve, etc.

When the engine is not operating, and the steering wheel is turned, gerotor (1) rotates to supply oil to steering cylinder (2). Thus the machine can be steered manually.

B : To PTO Clutch Valve, HST, GST Valve, etc.

W1012726
3. HYDRAULIC PUMP

The gear type hydraulic pump is adopted for these tractor. This pump is tandem type and it is composed two pair of gears, side plates, bushings and other components as shown in the figure.

The hydraulic pump pressure-fed the oil drawn from the transmission case through oil filter to power steering circuit and main hydraulic circuit.

(5) Bushing
(6) Bushing
(7) Driven Gear 2
(8) Side Plate

A : From Power Steering Controller
B : From Transmission Case
C : To Power Steering Controller
D : To Main Hydraulic Circuit
4. STEERING CONTROLLER

The steering controller mainly consists of a control valve, a metering device and a relief valve with check valve. The metering device comprises a set of special gear called “Gerotor”.

(1) Port Cover  (2) Hex. Drive Assembly  (3) Rotor  (4) Drive Plate  (5) Relief Valve  (6) Valve Plate  (7) Drive Link  (8) Stator  (9) Upper Cover
[1] CONTROL VALVE

The control valve is a rotary plate type valve. When the steering wheel is not turned, the position of the valve plate (5) and the manifolds (1), (3) is kept neutral by the centering springs (2). This causes the forming of a “Neutral” oil circuit.

When the steering wheel is turned either clockwise or counterclockwise, the position of the valve plate (5) and manifolds (1), (3) changes against the centering spring. This allows the forming of a “Right Turning” or “Left Turning” oil circuit. At the same time, the gerotor rotates with the valve plate and sends the oil to the cylinder corresponding to the rotation of the steering wheel.

[2] METERING DEVICE (GEROTOR)

All oil directed from the hydraulic pump to the steering cylinder passes through the metering device (gerotor) on its way. This metering device is a trochoid pump. As the steering wheel is turned, the action is transmitted directly to stator (2) through drive plate (1). Thus, the gerotor sends the amount of oil corresponding to the turn of the steering wheel to the hydraulic cylinder, and the front wheels are moved through the angle corresponding to the turn of the steering wheel.

When the engine is not operating or the hydraulic pump fails. The gerotor serves as a manual pump, and thus the machine can be steered manually.
[3] RELIEF VALVE (WITH CHECK VALVE)

If the pressure in the hydraulic circuit rises above the set pressure of the relief valve, the relief valve will actuate to prevent the pressure from rising further and protect the hydraulic system. Also, if no oil is supplied from the hydraulic pump, the relief valve will act as a check valve and help draw oil from the return oil line to the drain hose, thus making it possible to steer the machine manually.

(1) Outlet Port
(2) Check Valve
(3) Auxiliary Port
(4) Inlet Port
(5) R Port
(6) L Port
(7) Relief Valve

[A] Normal Condition
[B] Relief Valve in Operation
[C] Check Valve in Operation

a : From Hydraulic Pump
b : To Control Valve
c : From Control Valve
d : To Drain Hose
Neutral Position

When the steering wheel (1) is not being turned, valve plate (2) is held in the neutral position by centering spring. Under this condition, an oil passage is formed between P port (from pump) and T port (to transmission case) in the control valve, and all oil from the hydraulic pump flows to T port.

Right Turn

When the steering wheel is turned to the right, the action is transmitted through the drive plate, gerotor, and drive link to the control valve. Valve plate (2) then rotates to the right on manifolds, located on the opposite faces of the valve plate (2). Thus, the P port passage in the control valve is connected with gerotor (3).

The stator of gerotor (3) turns by the amount corresponding to the turn of the steering wheel (1), and the gerotor performs the metering function and lets oil through it, the amount of which corresponds to the turn of the steering wheel (1).

The oil which has passed through gerotor (3) flows back to the control valve, in which it is directed to cylinder port R to operate steering cylinder (4). Consequently, the front wheels are moved to the right through the angle corresponding to the amount of the oil.

When steering cylinder (4) operates, oil returning to cylinder port L flows back to the transmission case through the passage connected to T port in the control valve.
The steering system operates in the same way at a left-turn as well, except that oil flows into and out of steering cylinder in the directions opposite to those at a right-turn.

KiSC issued 02, 2007 A

W1013826
The steering cylinder is single piston both rod double-acting type. This steering cylinder is installed parallel to the front axle and connected to tie-rods. The tie-rods connected to both knuckle arm guarantees equal steering movement to both front wheels. The steering cylinder provides force in both directions. Depending upon direction the steering wheel is turned pressure oil enters at one end of the cylinder to extend, or the other end to retract it, thereby turning front wheel of the tractor.

4. CHECKING, DISASSEMBLING AND SERVICING

[1] HYDRAULIC PUMP

(1) Checking

**Preparation**

1. Open the bonnet (1).
2. Remove the side skirt RH (2).
3. Remove the fuel tank frame support (3), cover (6) and steering joint shaft (4).
4. Remove the regulator delivery pipe (7).

**(When reassembling)**

- Install the copper washers firmly.
- Tighten the steering joint shaft bracket mounting screw after adjusting the position of steering joint shaft bracket (5) for smooth rotation of the steering wheel.

Hydraulic Flow Test

IMPORTANT
- When using a flowmeter other than KUBOTA specified flowmeter, be sure to use the instructions with that flowmeter.
- Do not close the flowmeter loading valve completely, before testing, because it has no relief valve.

1. Loosen the GST/PTO delivery pipe and install the adaptor 52 to the pump discharge port.
2. Connect the hydraulic test hose to the adaptor 52 and flowmeter inlet port.
3. Connect the other hydraulic test hose to the flowmeter outlet port and to transmission fluid filling plug hole.
4. Open the flowmeter loading valve completely. (Turn counterclockwise.)
5. Start the engine and set the engine speed at 2000 to 2200 min⁻¹ (rpm).
6. Slowly close the loading valve to generate pressure approx. 9.8 MPa (100 kgf/cm², 1422 psi). Hold in this condition until oil temperature reaches approx. 40 °C (104 °F).
7. Open the loading valve completely.
8. Set the engine speed. (Refer to Condition.)
9. Read and note the pump delivery at no pressure.
10. Slowly close the loading valve to increase pressure (Rated pressure). As the load is increased, engine speed drops, therefore, reset the engine speed.
11. Read and note the pump delivery at rated pressure.
12. Open the loading valve completely and stop the engine.
13. If the pump delivery does not reach the allowable limit, check the pump suction line, oil filter or hydraulic pump.

Condition
- Engine Speed.....Approx. 2700 min⁻¹ (rpm)
- Rated pressure
  - L3130, L3430, L3830 .... 10.7 to 11.7 MPa
    - 109.1 to 119.3 kgf/cm²
    - 1552 to 1697 psi
  - L4630, L5030 ............... 12.7 to 13.7 MPa
    - 129.5 to 139.7 kgf/cm²
    - 1842 to 1987 psi
- Oil Temperature ............ 40 to 60 °C
  - 104 to 140 °F

(B) Pump Test Using Flow-meter [Hydrostatic Transmission Models]

Preparation
1. Open the bonnet (1).
2. Remove the side skirt RH (2).
3. Remove the fuel tank frame support (3), cover (6) and steering joint shaft (7).
4. Remove the fuel filter bracket (5) and power steering delivery pipe (4).

(When reassembling)
- Install the copper washers firmly.
- Tighten the steering joint shaft bracket mounting screw after adjusting the position of steering joint shaft bracket (8) for smooth rotation of the steering wheel.

Hydraulic Flow Test

**IMPORTANT**
- When using a flowmeter other than KUBOTA specified flowmeter, be sure to use the instructions with that flowmeter.
- Do not close the flowmeter loading valve completely, before testing, because it has no relief valve.

1. Install the adaptor 52 to the pump discharge port.
2. Connect the hydraulic test hose to the adaptor 52 and flowmeter inlet port.
3. Connect the other hydraulic test hose to the flowmeter outlet port and to transmission fluid filling plug hole.
4. Open the flowmeter loading valve completely. (Turn counterclockwise.)
5. Start the engine and set the engine speed at **2000 to 2200 min⁻¹** (rpm).
6. Slowly close the loading valve to generate pressure approx. **9.8 MPa (100 kgf/cm², 1422 psi)**. Hold in this condition until oil temperature reaches approx. 40 °C (104 °F).
7. Open the loading valve completely.
8. Set the engine speed. (Refer to **Condition**.)
9. Read and note the pump delivery at no pressure.
10. Slowly close the loading valve to increase pressure (Rated pressure). As the load is increased, engine speed drops, therefore, reset the engine speed.
11. Read and note the pump delivery at rated pressure.
12. Open the loading valve completely and stop the engine.
13. If the pump delivery does not reach the allowable limit, check the pump suction line, oil filter or hydraulic pump.

**Condition**
- Engine Speed.....Approx. 2700 min⁻¹ (rpm)
- Rated pressure
  - L3130, L3430, L3830 .... 10.7 to 11.7 MPa  
    109.1 to 119.3 kgf/cm²  
    1552 to 1697 psi
  - L4630, L5030 ............. 12.7 to 13.7 MPa  
    129.5 to 139.7 kgf/cm²  
    1842 to 1987 psi
- Oil Temperature ............ 40 to 60 °C  
  104 to 140 °F

4.00 Imp.gals/min. |
| Allowable limit                        |               | 16.2 L/min.  
4.28 U.S.gals/min.  
3.56 Imp.gals/min. |
(2) Disassembling and Assembling

- **IMPORTANT**
  - The hydraulic pump is precision machined and assembled: if disassemble once, it may be unable to maintain its original performance. Therefore, when the hydraulic pump fails, replacement should be carried out with the hydraulic pump assembled except when emergency repair is unavoidable.
  - When repair is required, follow the disassembly and servicing procedures shown below with utmost care.
  - Be sure to test the hydraulic pump with a flowmeter before disassembling.
  - After reassembly, be sure to perform break-in operation and ensure that there is nothing abnormal with the hydraulic pump.

(A) Removing Hydraulic Pump Assembly

**Bonnet and Side Skirt RH**
1. Open the bonnet (1).
2. Remove the side skirt RH (2).

(1) Bonnet (2) Side Skirt RH

**Regulator Valve (Manual and Glide Shift Transmission Models)**
1. Disconnect the power steering delivery pipe (4) and return hose (3).
2. Disconnect the GST/PTO delivery pipe (5) and regulator delivery pipe (1).
3. Remove the regulator valve (2).

(When reassembling)
- Apply grease to the O-ring and take care not to damage it.
- Install the copper washer firmly.

W10135590
Hydraulic Pump Running-In
After reassembly, perform break-in operation in the following manner, and check the pump for abnormality before use. If the pump temperature should rise noticeably during running-in, recheck should be performed.
1. Install the hydraulic pump to the tractor, and mount the suction pipe and delivery pipe securely.
2. Set the engine speed at 1300 to 1500 min$^{-1}$ (rpm), and operate the hydraulic pump at no load for about 10 minutes.
3. Set the engine speed at 2000 to 2200 min$^{-1}$ (rpm), and with the hydraulic pump applied with 2.94 MPa (30 kgf/cm$^2$, 427 psi) to 4.90 MPa (50 kgf/cm$^2$, 711 psi) pressure, operate it for approx. 15 minutes.
4. With the engine set to maximum speed, fully turn the steering wheel to the left or right, then actuate the relief valve five times for 25 seconds (one time 5 seconds).

(3) Servicing

Housing Bore (Depth of Scratch)
1. Check for the scratch on the interior surface of the housing caused by the gear.
2. If the scratch reaches more than half the area of the interior surface of the housing, replace at pump assembly.
3. Measure the housing I.D. where the interior surface is not scratched, and measure the housing I.D. where the interior surface is scratched.
4. If the values obtained in the two determinations differ by more than the allowable limit, replace the hydraulic pump as a unit.

(Reference)
• Use a cylinder gauge to measure the housing I.D.

Clearance between Bushing and Gear Shaft
1. Measure the gear shaft O.D. with an outside micrometer.
2. Measure the bushing I.D. with an inside micrometer or cylinder gauge, and calculate the clearance.
3. If the clearance exceeds the allowable limit, replace the gear shaft and the bushings as a unit.

[2] STEERING CONTROLLER

(1) Checking

Relief Valve Setting Pressure Test
1. Disconnect the power steering hose LT.
2. Install the power steering tee fitting adaptor to the steering controller and connect the power steering hose LT.
3. Install the adaptor D to the power steering tee fitting adaptor and set the cable and pressure gauge.
4. Start the engine and set the engine speed at maximum speed.
5. Fully turn the steering wheel to the left and read the pressure when the relief valve functions.
6. Stop the engine.
7. If the pressure is not within the factory specifications, check the pump delivery line or replace the steering controller assembly.

Condition
- Engine speed..............Maximum
- Oil temperature..............40 to 60 °C
  104 to 140 °F
(2) Disassembling and Assembling

**IMPORTANT**
- Use only the transmission fluid (See page G-7, 8), in no case use mixture of oils of different brands.
- Before disassembling the power steering system hydraulic components, check the performance of hydraulic pump and power steering using a flowmeter.
- After removing or disassembling the power steering hydraulic components, be sure to bleed air.

**[Bleeding]**
1. Start the engine.
2. Turn the steering wheels slowly in both directions all the way alternately several times, and stop the engine.

**Fuel Tank Frame Support, Cover and Steering Joint Shaft 2**
1. Remove the fuel tank frame support (1) and cover (2).
2. Remove the steering joint shaft 2 (3).

**(When reassembling)**
- Tighten the steering joint shaft bracket mounting screw after adjusting the position of steering joint shaft bracket (4) for smooth rotation of the steering wheel.

**Steering Controller Assembly**
1. Disconnect the power steering delivery pipe (4), steering hoses (3), (5) and return hose (2).
2. Remove the steering controller mounting screw (6) and take out the steering controller assembly (1).

**(When reassembling)**
- Reinstall the steering hoses (3), (5) to their original position.

| Tightening torque                  | Power steering delivery pipe retaining nut | 49.0 to 58.8 N·m  
|                                  |                                           | 5.0 to 6.0 kgf·m

[3] STEERING CYLINDER

(1) Disassembling and Assembling

Front Wheel, Cylinder Cover and Tie-rod
1. Place a disassembly stand under the engine and support it with a jack.
2. Remove the front wheel and cylinder cover (2).
3. Pull out the cotter pin and remove the tie-rod end slotted nut.
4. Disconnect the tie-rod (1).

(When reassembling)
• After tightening the tie-rod end slotted nut to the specified torque, install a cotter pin as shown in the figure.

<table>
<thead>
<tr>

Steering Cylinder
1. Disconnect the power steering hoses (1), (3) and remove the elbows.
2. Disconnect the tie-rod joint LH (4).
3. Remove the internal snap ring (2).
4. Take out the steering cylinder to the left.
5. Remove the head cover (7) and draw out the cylinder rod (6).

(When reassembling)
• Apply transmission fluid to the oil seal and O-ring.
• Apply liquid lock (Three Bond 1324B or equivalent) to the thread of tie-rod joint (4).
(2) Servicing

**Steering Cylinder I.D.**
1. Measure the steering cylinder I.D. with a cylinder gauge.
2. If the cylinder I.D. exceed the allowable limit, replace the cylinder tube.

<table>

1. STRUCTURE

[1] MANUAL TRANSMISSION AND GLIDE SHIFT TRANSMISSION

The hydraulic system of manual transmission and glide shift transmission models are composed of two hydraulic pumps, relief valve, position control valve, hydraulic cylinder, oil filter and other components as shown in the figure.

(1) Cylinder Safety Valve  (4) Lowering Speed Adjusting Valve
(2) Check Valve  (5) Oil Filter
(3) Rear Hydraulic Outlet  (6) Front Hydraulic Block
(7) Regulator Valve  (8) Power Steering Controller
(9) Hydraulic Pump 1  (10) Hydraulic Pump 2
(11) Relief Valve  (12) Hydraulic Cylinder

The hydraulic system of manual transmission and glide shift transmission models are composed of two hydraulic pumps, relief valve, position control valve, hydraulic cylinder, oil filter and other components as shown in the figure.
The hydraulic system of hydrostatic transmission model is composed of two hydraulic pumps, relief valve, position control valve, hydraulic cylinder, oil filters, oil cooler and other components as shown in the figure.

3. HYDRAULIC PUMP

The gear type hydraulic pump is adopted for these tractor. This pump is tandem type and it is composed two pair of gears, side plates, bushings and other components as shown in the figure.

The hydraulic pump pressure-fed the oil drawn from the transmission case through oil filter to power steering circuit and main hydraulic circuit.

(1) Drive Gear 1  
(2) Coupling

(8) Side Plate

A : From Power Steering Controller
B : From Transmission Case
C : To Power Steering Controller
D : To Main Hydraulic Circuit

W1013488
4. FRONT HYDRAULIC BLOCK

The front hydraulic block is provided to take power out from the tractor to operate the hydraulic cylinders on the implement, such as front end loader, front blade and so on.

(1) Cap
(2) Front Hydraulic Block
(3) Relief Valve

A : To Implement Control Valve
B : From Implement Control Valve
C : To Position Control Valve
P : From Hydraulic Pump
T1 : To Transmission Case
T2 : From Implement Control Valve
5. REAR HYDRAULIC BLOCK

The rear hydraulic block is equipped with cylinder safety valve, lowering speed adjusting valve and check valve, etc. besides hydraulic outlet port.

The hydraulic outlet port is located top of the rear hydraulic block to take power out from the tractor to operate the hydraulic cylinders on the implement.
6. POSITION CONTROL VALVE

**Neutral**

Pressurized oil flows at the P port, pushes open unload poppet 1 (4) and returns to tank from T1 port.

The oil in the chamber A behind the unload poppet 1 (4) returns to the tank from T4 port. The oil in the hydraulic cylinder does not flow out because the circuit is cut off by the actions of poppet 2 (1) and check valve in the rear hydraulic block.

This allows the implement to be kept at a steady height.

- P: Pump Port
- C1: Cylinder Port 1
- C2: Cylinder Port 2
- T1: Tank Port 1
- T2: Tank Port 2
- T3: Tank Port 3
- T4: Tank Port 4

**Lifting**

When the control lever is moved to “LIFT” position, spool (1) is pushed by the spool operating lever, forming a circuit with the P port and chamber A.

The pressurized oil thus flows into the chamber A and closes unload poppet 1 (2).

The oil from C1 port flows into hydraulic cylinder through check valve in the rear hydraulic block to lift the implement.

- P: Pump Port
- C1: Cylinder Port 1

**Symbols:**

- (1) Poppet 2
- (2) Spool
- (3) Unload Poppet 2
- (4) Unload Poppet 1

**Additional Notes:**

- A: Chamber A

KiSC issued 02, 2007 A
■ Lifting to Neutral (Acting the shockless mechanism)

In returning from Lifting to Neutral, the spool (1) is pushed back to the arrow-mark direction. When the Neutral position comes near, the groove part D of the spool (1) makes the pressure difference at the P port and C1 port. Therefore, the check valve in the rear hydraulic block gradually closes, and absorbs any shock at lifting stop. In that case, since oil is remained in the chamber A of the unload poppet 1 (2) and closes. However, the unload poppet 2 (3) opens because of low pressure in chamber B, and then the oil from the pump returns to the transmission case through T3 port until unload poppet 1 (2) opens.

(1) Spool  (2) Unload Poppet 1  (3) Unload Poppet 2
A : Chamber A  B : Chamber B  D : Groove
P : Pump Port  C1 : Cylinder Port 1  T3 : Tank Port 3

■ Lowering

When the control lever is moved to “DOWN” position, spool (2) moves to arrow-mark direction, and pushes the poppet 2 (1). It forms a circuit with the C2 port and T2 port.

The oil in the hydraulic cylinder is forced out by the weight of the implement, and returns to the tank through the C2 port and T2 port, lowering the implement.

The pressurized oil at the P port pushes open unload poppet 1 (3) and returns to tank from T1 port.

■ Floating

When the control lever is moved all the way to the bottom, spool (2) and poppet 2 (1) remain in the position described for “Lowering”. The oil flows freely between the hydraulic pump, hydraulic cylinder and tank.

(1) Poppet 2  (2) Spool  (3) Unload Poppet 1
A : Chamber A
P : Pump Port  C2 : Cylinder Port 2  T1 : Tank Port 1
T2 : Tank Port 2  T4 : Tank Port 4

KiSC issued 02, 2007 A
7. POSITION CONTROL LINKAGE

Position control is a mechanism to raise or lower the implement attached to the tractor in proportion to the movement of the control lever.

The implement can be positioned at any height by moving the position control lever. Fine position adjustment is also easy.

**Lift**
1. When the position control lever is moved to the LIFT position, the control arm shaft (2) rotates to the arrow. Therefore, the spool drive lever (3) moves around the fulcrum P and push the spool (1) opening the LIFT circuit.
2. When the lift arm moves upward, the feedback lever shaft (4) is rotated to the arrow, since the feedback rod is actuated. Therefore, the spool drive lever (3) moves around the fulcrum Q and pull the spool (1).
3. The lift arm stops when the spool returns to the neutral position.

**Down**
1. When the position control lever is moved to the DOWN position, the control arm shaft (2) rotates to the arrow. Therefore, the spool drive lever (3) moves around the fulcrum P and pull the spool (4) opening the DOWN circuit.
2. When the lift arm moves downward, the feedback lever shaft (4) is rotated to the arrow, since the feedback rod is actuated. Therefore, the spool drive lever (3) moves around the fulcrum Q and pushes the spool (1).
3. The lift arm stops when the spool (1) returns to the neutral position.

KiSC issued 02, 2007 A
Draft control is a system which maintains a constant traction load, and is suited for the work which needs heavy traction load such as plowing.

The implement is automatically raised when its traction load is increased, and lowers when the traction load is decreased. By maintaining a constant load level, it prevents the tractor from slipping and being loaded excessively. The setting traction load can be adjusted by changing the position of the draft control lever.

The draft control system uses the same control valve as the position control system. Therefore it is possible to use the mixed control. The traction load applied to the tractor is sensed and is fed back to the control valve by means of the other linkage mechanism.
■ Position Control Operation

**Lift (a)**
1. When the position control lever (3) is moved to the LIFT side, the position control link (2) is also rotated and pushes the arm 1 (1).
2. At the same time, the arm 2 (5) is moved, the connected position control valve becomes the lift circuit, and the lift arm goes up.

**Down (b)**
1. When the position control lever (3) is moved to the DOWN side, the position control link (2) is also rotated.
2. By this action, the arm 2 (5) and the arm 1 (1) are returned by the return spring (4).
3. The position control valve becomes the down circuit and the lift arm is lowered.

(Reference)
- For the feedback mechanism of the position control, refer to “Position Control”.

---

(W1016226)
Draft Control Operation

When the draft control lever (6) is operated in the draft control operated range, the draft control lever shaft is rotated, causing the draft cam (10) to move toward the roller (9) installed on the draft control link 2 (3).

(Reference)
- The sensitivity of the draft control can be adjusted by changing the gap between the draft cam (10) and the roller (9) by the draft control lever (6).

Movement of the Link Under Increased Load (a)
1. When the traction load is increased, the torsion bar is twisted according to the load, the draft control rod (1) and the draft cam (10) are pushed to come into contact with the roller (9).
2. Using the A portion as the fulcrum, the draft control link 2 (3) and the draft control link 1 (4) move to push the arm 1 (5).
3. At the same time, the arm 2 (11) is moved, the connected position control valve becomes the lift circuit, and the lift arm goes up.

Movement of the Link Under Decreased Load (b)
1. When the lift arm goes up, the traction load is decreased, and the draft control rod (1) is returned.
2. At the same time, the arm 2 (11), arm 1 (5), and draft control link 1 (4) are returned by the return spring (8).
3. The position control valve becomes the down circuit, and the lift arm is lowered.

(Reference)
- The feedback rod (12) of the draft control is provided to maintain the position relation of the draft cam (10) and the roller (9) to certain state regardless of the height of the lift arm.
9. MIXED CONTROL

Mixed control is a system combining position control with draft control.

When traction load increases, the draft control functions to raise the lift arms (implement). When traction load reduces, the lift arms (implement) lower to the height set by the position control only, when traction load increases, slippage or engine stop may occur unless the implement is raised.

With the draft control only, plowing depth cannot be kept constant if soil hardness changes greatly.

The mixed control serves to eliminate such disadvantages.

A : Position Controlled
B : Draft Controlled
C : Not Deep Even in Soft Soil
D : Shallow where Resistance Occurs
10. LOWERING SPEED ADJUSTING VALVE

Turning the rotor shaft (2) clockwise decreases the lowering speed, and counterclockwise increases lowering speed of the three points linkage. When the rotor shaft (2) is completely closed, the three point linkage is held at its position since oil in the hydraulic cylinder is sealed between the hydraulic cylinder and rotor (4).

(1) Holder
(2) Rotor Shaft
(3) Pin
(4) Rotor
(5) Position Control Valve

A : Closed Position
B : Open Position
C : Cylinder Port
T : Tank Port
11. HYDRAULIC CYLINDER

The external type hydraulic cylinders are used for three point linkage system. This hydraulic cylinder is single acting type, and it is installed directly between hydraulic lift arm and lower link.

The main components of the hydraulic cylinder are shown in the figure.

1. Cylinder Tube
2. Rod
3. Wiper
4. Snap Ring
5. O-ring
6. Head
7. Bushing
8. Snap Ring

Control Valve

W1015282
12. AUXILIARY CONTROL VALVE

[1] DOUBLE ACTING TYPE 1

- **Neutral**
  Pressure-fed oil from the hydraulic pump is delivered into the P port, and flows to the position control valve via N port.

  - (1) Check Valve
  - (2) Spool
  - P: Pump Port
  - N: Neutral Port
  - A: A Port (Implement Cylinder)
  - B: B Port (Implement Cylinder)

- **Lift**
  When the spool (2) is moved in the direction of the arrow, the pressure-fed oil in the P port opens the check valve (1) and flows to the implement cylinder via B port.
  Return oil from the implement cylinder flows from the A port to the transmission case through T port.

  - (1) Check Valve
  - (2) Spool
  - P: Pump Port
  - N: Neutral Port
  - A: A Port (Implement Cylinder)
  - B: B Port (Implement Cylinder)
  - T: Tank Port

- **Down**
  When the spool (2) is moved in the direction of the arrow, the pressure-fed oil in the P port opens the check valve (1) and flows to the implement cylinder via A port.
  Return oil from the implement cylinder flows from the B port to the transmission case through T port.

  - (1) Check Valve
  - (2) Spool
  - P: Pump Port
  - N: Neutral Port
  - A: A Port (Implement Cylinder)
  - B: B Port (Implement Cylinder)
  - T: Tank Port
[2] DOUBLE ACTING TYPE 2 (FLOATING WITH DETENT)

■ Neutral

Pressure-fed oil from the hydraulic pump is delivered into the P port, and flows to the position control valve via N port.

■ Lift

When the spool (1) is moved in the direction of the arrow, the pressure-fed oil in the P port opens the check valve (2) and flows to the implement cylinder via B port.

Return oil from the implement cylinder flows from the A port to the transmission case through T port.
## Down

When the spool (1) is moved in the direction of the arrow, the pressure-fed oil in the P port opens the check valve (2) and flows to the implement cylinder via A port.

Return oil from the implement cylinder flows from the B port to the transmission case through T port.

## Floating

When the spool (1) moves to extreme left, the detent ball (3) and detent sleeve (4) hold the spool (1) at the floating position as shown in the figure. The pressure-fed oil from the hydraulic pump flows to position control valve via N port. And, the A port and B port lead to the T port along the notched sections of the spool (1). This result in the attached implement to follow the contour of the terrain.
[3] SINGLE ACTING TYPE

■ Neutral

Pressure-fed oil from the hydraulic pump is delivered into the P port, and flows to the position control valve via N port.

■ Lift

When the spool (2) is moved in the direction of the arrow, the pressure-fed oil in the P port opens the check valve (1) and flows to the implement cylinder via A port.
When the spool (2) is moved in the direction of the arrow, return oil from the implement cylinder flows from the A port.

4. CHECKING, DISASSEMBLING AND SERVICING

[1] HYDRAULIC PUMP

(1) Checking

(A) Pump Test Using Flow-meter

**Preparation**
1. Open the bonnet (1).
2. Remove the side skirt RH (2).
3. Remove the main delivery pipe (3).

**When reassembling**
- Install the copper washers firmly.

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Main delivery pipe joint bolt</th>
</tr>
</thead>
<tbody>
<tr>
<td>49.0 to 68.6 N·m</td>
<td>5.0 to 7.0 kgf·m</td>
</tr>
<tr>
<td>36.2 to 50.6 ft-lbs</td>
<td></td>
</tr>
</tbody>
</table>

(1) Bonnet
(2) Side Skirt RH
(3) Main Delivery Pipe
Hydraulic Flow Test

IMPORTANT
- When using a flowmeter other than KUBOTA specified flowmeter, be sure to use the instructions with that flowmeter.
- Do not close the flowmeter loading valve completely, before testing, because it has no relief valve.

1. Install the pump adaptor (see page G-54) with O-ring to the pump discharge port.
2. Connect the hydraulic test hose to the adaptor and flowmeter inlet port.
3. Connect the other hydraulic test hose to the flowmeter outlet port and to transmission fluid filling plug hole.
4. Open the flowmeter loading valve completely. (Turn counterclockwise.)
5. Start the engine and set the engine speed at 2000 to 2200 min⁻¹ (rpm).
6. Slowly close the loading valve to generate pressure approx. 14.7 MPa (150 kgf/cm², 2133 psi). Hold in this condition until oil temperature reached approx. 40 °C (104 °F).
7. Open the loading valve completely.
8. Set the engine speed. (Refer to Condition.)
9. Read and note the pump delivery at no pressure.
10. Slowly close the loading valve to increase (Rated pressure). As the load is increased, engine speed drops, therefore, reset the engine speed.
11. Read and note the pump delivery at rated pressure.
12. Open the loading valve completely and stop the engine.
13. If the pump delivery does not reach the allowable limit, check the pump suction line, oil filter or hydraulic pump.

Condition
- Engine Speed.....Approx. 2700 min⁻¹ (rpm)
- Rated pressure
  L3130, L3430, L3830 .... 17.1 to 18.1 MPa
  174.4 to 184.6 kgf/cm²
  2480 to 2625 psi
  L4630, L5030 .............. 18.1 to 19.1 MPa
  184.6 to 194.8 kgf/cm²
  2625 to 2770 psi
- Oil Temperature .......... 40 to 60 °C
  104 to 140 °F

A : Manual and Glide Shift Transmission
B : Hydrostatic Transmission

(2) Disassembling and Assembling

**IMPORTANT**
- The hydraulic pump is precision machined and assembled: if disassemble once, it may be unable to maintain its original performance. Therefore, when the hydraulic pump fails, replacement should be carried out with the hydraulic pump assembled except when emergency repair is unavoidable.
- When repair is required, follow the disassembly and servicing procedures shown below with utmost care.
- Be sure to test the hydraulic pump with a flowmeter before disassembling.
- After reassembly, be sure to perform break-in operation and ensure that there is nothing abnormal with the hydraulic pump.

(A) Removing Hydraulic Pump Assembly

**Bonnet and Side Skirt RH**
1. Open the bonnet (1).
2. Remove the side skirt RH (2).

(1) Bonnet  (2) Side Skirt RH
Regulator Valve (Manual and Glide Shift Transmission Models)
1. Disconnect the power steering delivery pipe (4) and return hose (3).
2. Disconnect the GST/PTO delivery pipe (5) and regulator delivery pipe (1).
3. Remove the regulator valve (2).

(When reassembling)
- Apply grease to the O-ring and take care not to damage it.
- Install the copper washers firmly.

<table>

</tbody>
</table>
(B) Disassembling Hydraulic Pump

Hydraulic Pump Assembly
1. Remove the pump cover mounting screws (7).
2. Remove the drive gear (6), driven gear (2) and side plate (3) from the casing.

(When reassembling)
- Take care not to damage the gasket.
- Align the hole of the pump cover (5) and casing 2 (4).
- Install the side plate, noting its location and direction.
- Install the gears, noting its direction.

<table>
<thead>
<tr>

<tr>
<td>28.9 to 32.5 ft-lbs</td>
<td></td>
</tr>
</tbody>
</table>

Hydraulic Pump Running-In
After reassembly, perform break-in operation in the following manner, and check the pump for abnormality before use. If the pump temperature should rise noticeably during running-in, recheck should be performed.
1. Install the hydraulic pump to the tractor, and mount the suction pipe and delivery pipe securely.
2. Set the engine speed at 1300 to 1500 \( \text{min}^{-1} \) (rpm), and operate the hydraulic pump at no load for about 10 minutes.
3. Set the engine speed at 2000 to 2200 \( \text{min}^{-1} \) (rpm), and with the hydraulic pump applied with 2.94 MPa (30 kgf/cm², 427 psi) to 4.90 MPa (50 kgf/cm², 711 psi) pressure, operate it for approx. 15 minutes.
4. With the engine set to maximum speed, fully turn the steering wheel to the left or right, then actuate the relief valve five times for 25 seconds (one time 5 seconds).

(3) Servicing

Housing Bore (Depth of Scratch)
1. Check for the scratch on the interior surface of the housing caused by the gear.
2. If the scratch reaches more than half the area of the interior surface of the housing, replace at pump assembly.
3. Measure the housing I.D. where the interior surface is not scratched, and measure the housing I.D. where the interior surface is scratched.
4. If the values obtained in the two determinations differ by more than the allowable limit, replace the hydraulic pump as a unit.

<table>
<thead>
<tr>
<th>Depth of scratch</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.09 mm</td>
<td>0.0035 in.</td>
</tr>
</tbody>
</table>

(Reference)
- Use a cylinder gauge to measure the housing I.D.
Clearance between Bushing and Gear Shaft
1. Measure the gear shaft O.D. with an outside micrometer.
2. Measure the bushing I.D. with an inside micrometer or cylinder gauge, and calculate the clearance.
3. If the clearance exceeds the allowable limit, replace the gear shaft and the bushings as a unit.

<table>
<thead>
<tr>
<th>Clearance between bushing and gear shaft</th>

[2] RELIEF VALVE

(1) Checking and Adjusting

Relief Valve Setting Pressure Test
1. Remove the delivery pipe joint bolt from front hydraulic block.
2. Install the adaptor E. Then connect the cable and pressure gauge to adaptor E.
3. Start the engine and set at maximum speed.
4. Move the position control lever (1) all way up to operate the relief valve and read the gauge.
5. If the pressure is not within the factory specifications, remove the relief plug (2) of front hydraulic block (3) and adjust with the adjusting shims (4).
6. After the relief valve setting pressure test, reset the position control lever stopper firmly.

<table>
<thead>

[3] REAR HYDRAULIC BLOCK AND VALVES

(1) Checking and Adjusting

Position Control Feedback Rod Adjustment
1. Set the position control lever (1) to the lowest position.
2. Start the engine, and after warming-up, set the engine speed at the idling.
3. Move the position control lever (1) to the uppermost position.
   [The lever is raised until spring finishes shrinking, and the lever position is put into the state to release.]
4. While pulling the feedback rod to the rear, turn the adjusting nut (4) clockwise until the relief valve begins to be operated.
5. From the relief valve operating position, turn back the adjusting nut (4) counterclockwise by 2 turns.
6. Tighten the lock nut (5).
7. Set the engine speed at the maximum.
8. Move the position control lever (1) to the lowest position and uppermost position to check the relief valve does not operate.
9. Set the position control lever (1) to the uppermost position, then move the lift arm to the upper end by hand and measure the free play.
10. If the measurement is not within the factory specifications, adjust the position control feedback rod setting length.
    - To reduce lift arm free play → Shorten the position control feedback rod setting length.
    - To increase lift arm free play → Lengthen the position control feedback rod setting length.

<table>

KiSC issued 02, 2007
Checking Draft Control Sensitivity (If equipped)
1. Attach the test bar (2) to the top link bracket.
2. Start the engine, set at maximum speed.
3. Set the draft control lever (5) to the lowest position. (Refer to figure A.)
4. Set the position control lever (4) between lever guide 4 and 5. (Refer to figure A.)
5. Lift the test bar (2) upward until the top link bracket (1) comes in contact with the stopper.
6. Confirm the lower link does not rise.
7. Set the draft control lever (4) to 7 position of the lever guide. (Refer to figure B.)
8. Lift the test bar (2).
9. Confirm the lower links (3) must rise before the top link bracket (1) contact the stopper.
10. If the specified play is not obtained, readjust the feedback rod. (Refer “Adjusting Draft Control Position Section”.)

(1) Top Link Bracket   (4) Draft Control Lever
(2) Test Bar           (5) Position Control Lever
(3) Lower Link

Seat, Seat Bracket and Cover
1. Remove the seat (1).
2. Remove the seat bracket (2) together with cover (3).

(1) Seat           (3) Cover
(2) Seat Bracket

W1015907
Rear Hydraulic Block
1. Disconnect the position control feedback rod (5) and return hoses (4).
2. Remove the lowering speed adjusting valve joint shaft (8).
3. Disconnect the hydraulic cylinder hose RH (2) and delivery pipe (3).
4. Tap out the spring pin from position control lever (1).
5. Remove the auxiliary control valve (9) and pipes (10).
6. Remove the rear hydraulic block mounting screws.
7. Remove the rear hydraulic block (6) and disconnect the position control lever (1) and hydraulic cylinder hose LH (7).

(When reassembling)
- Install the copper washers firmly.
- Visually inspect the gasket, if damaged replace with new one.
- After reassembling, be sure to adjust the position control feedback rod length. (See page 8-S12.)

(3) Servicing

**Operating Pressure of Cylinder Safety Valve**
1. Attach the cylinder safety valve to a injection nozzle tester with a safety valve setting adaptor.
2. Measure the operating pressure of the cylinder safety valve.
3. If the operating pressure is not within the factory specifications, adjust by turning the adjusting screw (1).
4. After adjustment, tighten the lock nut (2) firmly.

**NOTE**
- Use specified transmission fluid (see page G-7, 8) to test the operating pressure of the cylinder safety valve.

Disassembling Hydraulic Cylinder

1. Remove the cylinder cover (1).
2. Remove the liquid gasket from top of head (5).
3. Slightly tap-in the head (5) to inside, and remove the internal snap ring (4) by using the small screwdriver.
4. If the internal snap ring (4) cannot be removed by above-mentioned method, remove it by the following procedure.
   - Carefully clamp the cylinder tube (3) in a vise.
   - Drill approx. 2.5 mm (0.1 in.) diameter hole on the cylinder tube (position A) just over the internal snap ring (4) as shown in figure.
   - Use a small screwdriver and remove the internal snap ring (4). Simultaneously support this action by pushing from the outside of the cylinder tube with another small screwdriver or similar tool.
5. Draw out the rod (6) and head (5).
6. Inject the compressed air through the oil inlet port of the cylinder tube (3), and remove the piston (2).
7. Remove the external snap ring (7), and remove the head (5).

(When reassembling)
- Apply transmission fluid to the piston (2), head (5) and cylinder tube (3).
- Take care not to damage the O-ring, backup ring and seal.
- Apply liquid gasket (Three Bond 1208D or equivalent) to the top of head (5), while pressing the head (5) against internal snap ring (4).
- After reassembling the cylinder, be sure to close the drilled hole by liquid gasket.

Lift Arm and Lift Arm Shaft
1. Remove the external snap ring (5).
2. Remove the lift arm RH (6).
3. Draw out the lift arm shaft (1) and lift arm LH (7) as a unit.
4. Remove the collar (4) and O-ring (3).

(When reassembling)
- Align the alignment marks (8) of the lift arm shaft and lift arms.
- Apply grease to the right and left bushings of lift arm support and O-rings.
- Take care not to damage the O-rings.

2. ELECTRONIC CONTROL PANEL

[1] SYSTEM OUTLINE AND ELECTRICAL CIRCUIT

(1) System Outline

The Electronic Instrument Panel (IntelliPanel) adopted in the L30 series tractors consists of an 8-bit Central Processing Unit (CPU\(^1\)), sensors and input devices, memory devices such as RAM and ROM, and others. The CPU executes multiplex-communication\(^2\) with ECU (Electronic Control Unit) and various sensors, switches and other related devices in order to give the functions that accurately and timely provide an operator with various information necessary for tractor operation. The contents include corrective procedure in case of an erroneous operation, precautions, and various alerts. If the tractor gets in trouble, a defective location, for example, is displayed with a message (sign) on the liquid crystal display (LCD\(^3\)) or indicated with a monitor lamp.

The messages are displayed with segments, which gives approximately 130 patterns.

In the LCD, characters appear over reflected illumination, and are always back-lit by a small yellow lamp while the main switch is “ON”.

\(^1\) CPU

This CPU is the core part of computers that controls the input/output devices to receive data, processes the data, and sends out the computing results.

The CPU comes in different types: 8 bits, 16 bits, 32 bits, etc., according to the number of bits as the unit of internal data processing. In general, the larger the number is, the higher the performance is.

\(^2\) Multiplex communication

In multiplex communication, just one transmission (signal) line is effectively used to send and receive signals for digital transmission. In data communication, the transmission capacity of the line and the capacity of signal transmission/reception are represented by the number of bits that can be transmitted or received for one second. When the capacity of the transmission line is extremely larger than the ability of the transmission/reception performed by a terminal device, signals from plural terminals can be transmitted by means of time-sharing and multiplexing of one transmission path.

The merits of multiplex communication are as follows:
1. It permits high-performance control that allows three units to share information from sensors and information required for control.
2. It provides the smaller number of wire harnesses.
3. It allows each control unit to independently control the connected devices if communication should fail for some reason and become impossible.

\(^3\) LCD

LCD is a displaying device that utilizes the characteristic of liquid crystal, in which the application of voltage triggers the molecules to change their orientations. The principle of indication is that when a voltage is applied on a liquid crystal sandwiched between two glass plates, the direction of molecules changes, with the resultant variation of the oscillatory direction of light that penetrates the liquid crystal. The set-up of a polarizing plate makes light go through or get blocked according to a change in voltage. Since the use of only the polarizing plate results in peculiar color, the film to counteract colored light is superimposed. However, the liquid crystal itself does not generate light, so it is back-lit by a fluorescent tube, for example, which makes the display easy to read in a dark space.
(2) Control Items

For HST models and manual transmission models, the electronic instrument panel (IntelliPanel) functions to receive data from sensors and switches, and displays them on the meter. For GST models, the IntelliPanel also receives data also from the GST control ECU (Electronic Control Unit) through multiplex communication, and displays them on the panel. Further, the GST control ECU receives model data and sensor data from IntelliPanel to determine the control status.

In addition, the IntelliPanel controls the following items.

1. Various Information Display Function
   - Normal Display
     Receive various data from each sensor, and display the hour meter, the traveling speed, the PTO speed, the fuel level, and the coolant temperature, etc. on the LCD which are basic information necessary for the tractor operation.
   - Attention Display (at engine starting)
     Display the operator’s guidance of levers and pedals at the engine starting on the LCD.
   - Service Interval Display
     Display and alert the service interval periodically on the LCD and panel.
   - Warning Display
     Display the fuel level warning and overheat warning on the LCD and panel.
   - Error Display
     Display the occurrence of trouble with the sign on the LCD by the self-diagnosis function.

2. Lamp Control Function
   Control the lighting and blinking of the warning lamp and the monitor lamp for operation.

3. Self-diagnosis Function

4. Fail-safe Function
   It is a function that the entire system operates safely when the part of system gets in trouble.

5. Glow Control Function

6. Data Input, Fine-adjustment and Test Function
   The function such as an input of various data, fine-adjustment of GST, and a testing of each sensor, etc. can be done by using LCD and switch operation.

(29) Position Switch

[A] For HST Model
[B] For GST Model
[C] For Manual Transmission Model and GST Model
- Electronic Instrument Panel (IntelliPanel)
  An 8 bit CPU is incorporated into the IntelliPanel, and outputs the status of the tractor to the LCD, monitor lamp, tachometer, and buzzer. The built-in buzzer starts sounding, interlocked with alert/failure indications as well as with indication switching, and permits to make sure of the operational status of each part.

  (1) Electronic Instrument Panel (IntelliPanel)  

- Main Switch
  The main switch (1) transmits a main switch “ON” signal and an “ST” signal at the time of engine start to the IntelliPanel. When each lever switch and the associated are in the neutral position, the computer in the IntelliPanel detects the signals and determines whether the engine can be started safely.

  (1) Main Switch

- Combination Switch
  The illumination lamp within the IntelliPanel lights up by the operation of the headlight switch (1), interlocked with the light-up of the headlight. When the high beam headlight is used, the monitor lamp at the panel lights up. The pilot lamp at the panel lights up by the operation of turn signal switch (2), interlocked with the turn signal lamp flashing through the hazard unit.

  (1) Headlight Switch  (2) Turn Signal Switch

- Hazard Switch
  The pilot lamp at the panel lights up by the operation of hazard switch (1), interlocked with the hazard lamp flashing through the flasher unit.

  (1) Hazard Switch
■ Position Switch

Position switch (1) is used to lighting the position lamp. The lamp in this switch is lighted up when this switch is ON.

(1) Position Switch

W1019828

■ Display Mode Switch and Travel Speed Switch

These switches are located at the right of the IntelliPanel and both are of tact type. Usually, the display mode switch (1) is used at the switching of display indication, and the traveling speed switch (2) is used to switching to the traveling speed display as well as at data input and fine adjustment.

(1) Display Mode Switch  (2) Traveling Speed Switch

W1014375

■ Brake Lamp Switch

This switch is mounted on the brake pedal. When the brake pedal is depressed, this switch is turned on and the brake lamp is lighting.

(1) Brake Lamp Switch

W1020505

■ Parking Brake Switch

This switch (1) is turned on and off interlocked with the parking brake lever. It is switched on when the parking brake lever is pulled up, thereby sending a signal to light up the pilot lamp at the IntelliPanel.

(1) Parking Brake Switch

W1014449
**PTO Switch**

This switch (1) is mounted on the PTO shift lever (2), and sends a signal to light up the lamp at the IntelliPanel when PTO is used. It also serves as a safety switch when the engine is started.

(1) PTO Switch  
(2) PTO Shift Lever

W1014516

**PTO Speed Change Switch : for Manual Transmission Model**

This switch (1) is turned on by the PTO speed change lever operation, and sends a signal to the IntelliPanel.

(1) PTO Speed Change Switch

W1014252

**Fuel Sensor**

This sensor (1) is designed to detect the fuel level in the fuel tank. It detects the position of the float that moves according to the quantity of fuel through the variation in resistance of the variable resistor, in order to indicate the fuel level on the LCD. It also sends a signal to light up the monitor lamp at the IntelliPanel when fuel becomes less than 5 L (1.3 U.S.gals, 1.1 Imp.gals).

(1) Fuel Sensor

W1014733

**Coolant Temperature Sensor**

This sensor (1) is designed to detect the temperature of coolant. It employs a thermistor, and detects the variation in resistance due to a change in temperature to indicate the temperature on the LCD. It also sends a signal to light up the alarm lamp in case of overheat, and indicate an alert message.

(1) Coolant Temperature Sensor

W1014804
■ Engine Oil Pressure Switch
This switch (1) is turned on when the main switch is turned on and the engine oil pressure becomes lower than 49 kPa (0.5 kgf/cm², 7.1 psi), and sends a signal to light up the alarm lamp.

(1) Engine Oil Pressure Switch

■ Alternator
The terminal L of this alternator detects a signal from the battery charge. The alternator sends a signal for making the alarm lamp at the IntelliPanel to light up if the electricity charge system becomes abnormal.

(1) Alternator

■ Engine Tachometer Sensor
This sensor (1) is mounted at the right side of the engine gear case, and generates pulses proportional to the rotation of the fuel camshaft and the number of the cam gear teeth. The engine speed is calculated from the frequency of the pulse. The tachometer of the IntelliPanel is of cross coil type, and analogically indicates by and after converting the frequency of the engine tachometer sensor. The PTO speed is calculated by means of using the frequency detected by this sensor and operational coefficient preset from model to model.

(1) Engine Tachometer Sensor

■ Traveling Speed Sensor
This sensor (1) is mounted at the right bottom of the transmission case, and generates pulses proportional to the rotating speed and the number of teeth of the front-wheel drive gear on the PTO drive shaft. The speed of the tractor is calculated by means of using the frequency of the pulse and the operational coefficient preset for the model and tire size in question.

(1) Traveling Speed Sensor
### Glow Relay

This tractor has a system in which glow control is performed through the IntelliPanel, and controls the coil current that starts or stops the preheating circuit through the electronic meter. The time required for preheating is adjusted by means of the water temperature sensor.

(1) Glow Relay

W1015142

### Electronic Control Unit (ECU) : for GST Model

The ECU (1) functions to operate GST in accordance with information coming from various sensors.

It has the role of controlling all the components while sharing sensor information necessary for control and control information with the IntelliPanel, and consists of 16 bit CPU and interface that corresponds to the signal inlet and outlet.

(1) Electric Control Unit (ECU)

W1015355

### GST Valve (Solenoid Valves and Proportional Reducing Valve) : for GST Model

This valve (1) includes the sensors and switches and the associated necessary for GST control, solenoid that actuates GST, shift pin, proportional reducing valve, and others. It sends information from sensors and the associated to ECU, and then a signal from ECU actuates each solenoid valve.

(1) GST Valve Assembly  (2) Proportional Reducing Valve

W1015434

### Shuttle Switch : for Manual Transmission and GST Model

This switch (1) is mounted at the bottom of the shuttle lever shaft (2) and is turned on when the position of F, N, or R is detected through the movement of the sensor lever, thereby outputting a 12 V signal to the IntelliPanel and ECU.

It also serves as a safety switch when the engine is started.

(1) Shuttle Switch  (2) Shuttle Lever Shaft

W1015505
■ GST Lever Sensor : for GST Model

This sensor (1) is designed to detect the position at which the GST lever changes speed, and is mounted at the bottom of the GST lever (2). It has the variable resistor of revolution angle type, the maximum resistance value is 2 kΩ, and the electrically effective angle is 140 degrees. It also outputs the position of the lever from N to 12th speed stage in the range of approximately 0.5 to 3.5 V, and then sends a signal to the IntelliPanel and ECU.

W1015572

■ Oil Pressure Switch : for GST Model

This switch (1) is designed to detect that the gear shift completion of GST and pressurizing of GST clutch pressure, and is mounted at the side of GST valve. It is turned on when the pilot pressure has become higher than 0.49 MPa (5 kgf/cm², 71 psi) and is turned off when the pressure has become lower than 0.34 MPa (3.5 kgf/cm², 50 psi).

W1015635

■ Oil Temperature Sensor : for GST Model

This sensor (1) is designed to detect the temperature of transmission oil and is mounted at the side of GST valve. It is provided in order to compensate the operating time and electric current of the proportional reducing valve within GST valve, according to the transmission oil temperature.

The sensor employs the thermistor in which a rise in oil temperature causes smaller resistance and a fall in the temperature causes larger one.

W1015709

■ HST Range Gear Shift Lever Sensor : for HST Model

This sensor (1) is designed to detect the position at which the HST range gear shift lever changes the speed, and is mounted at the bottom of the lever.

It has the variable resistor of revolution angle type, and the maximum resistance value is 5.4 kΩ. It outputs the lever position of L, M, N or H in the range of approximately 1.0 to 4.0 V.

W1015780
■ HST Pedal Neutral Switch : for HST Model
This switch (1) is mounted on the HST pedal link, and is turned on when the HST pedal is in the neutral position. It serves as a safety switch when the engine is started.

(1) HST Pedal Neutral Switch

W1015847

■ Cruise Control Switch : for HST Model
This switch (1) is mounted at the bottom of the cruise lever assembly, and is turned on when the lever is operated, thereby sending a signal to light up the pilot lamp at the electronic instrument panel.

(1) Cruise Control Switch

W1015910

■ Clutch Pedal Switch : for HST Model
This switch (1) is mounted close to the fulcrum of the clutch pedal, and is turned on when the pedal is depressed (clutch “OFF”). It serves as a safety switch when the engine is started.

(1) Clutch Pedal Switch (2) Clutch Pedal

W1014615
- Emergency Connector: for GST Model
  This is a device which compulsorily operates the shift solenoid when the tractor does not move due to the trouble of the GST system and moves the tractor.

(Situation for necessity of emergency connector)
- The defect in ECU
- The tractor does not move at all even if the shuttle lever and GST lever are operated though the trouble is repaired.

(Use of emergency connector)
1. Stop the engine.
2. Disconnect the ECU connector (3).
3. Remove the each cap from connectors (1), (2).
4. Connect the connector A and B.
5. Start the engine and move the tractor.

NOTE
- When connecting the emergency connectors, the GST valve is set at 1st speed position even if the GST lever is at any position. And the stop and the start of the tractor is operated by shuttle lever.

IMPORTANT
- Be sure to disconnect the ECU connector when using the emergency connector.

(1) Emergency Connector A
(2) Emergency Connector B
(3) ECU Connector

KiSC issued 02, 2007 A
[3] CONTROL SYSTEM

(1) Basic Control System

(A) Normal Display

The normal display is a message indicated in the liquid crystal display (LCD) while the main switch is turned ON or the engine is starting.

The fuel gauge and coolant temperature gauge are always displayed on a right edge of LCD, and the position of gear shifting is displayed on a left edge for GST and HST model.

By pushing the display mode switch (3), it is switched to five kinds of displays shown in the table below.

<table>

**NOTE**

- Trip meter can be reset to 0.0 h by pushing and holding the display mode switch for about two seconds with trip meter displayed.
- *1: Let’s suppose that the PTO gear shift lever is at the neutral position. When you turn ON the PTO clutch control lever, the PTO shaft stays off but the meter displays the rpm at the L position. This is normal, not a machine failure.
(B) Attention Display (At Engine Starting)

If neither of the levers or pedals are in neutral positions when the main switch is turned to the “START” position, the engine cannot be started. The IntelliPanel displays a message for the operator to correct the situation by placing the appropriate lever or pedal in the neutral position.

- Manual Transmission and GST Model
  The safety switch for engine starting is adapted for the shuttle lever and the PTO shift lever in these models.

(Reference)
- As for the manual transmission model, selected speed displayed on left edge is not indicated.

- When the shuttle lever is not set at a Neutral position
  Shift the shuttle lever to Neutral position.
  W1017623

- When the PTO shift lever is not set at a Neutral Position
  Shift the PTO shift lever to Neutral position.
  W1017667

- When both the shuttle lever and the PTO shift lever are not set at a Neutral position
  Shift both shuttle lever and PTO shift lever to Neutral position.
  W1017711
HST Model

The safety switch for engine starting is adapted for HST pedal, PTO shift lever and clutch pedal in this model.

- **When the HST pedal is not set at a Neutral position**
  Release the HST pedal to set the **Neutral** Position.
  W1017819

- **When the PTO shift lever is not set at a Neutral position**
  Shift the PTO shift lever to **Neutral** position.
  W1017869

- **When the clutch pedal is not depressed**
  Depress the clutch pedal.
  W1017913

- **When the HST pedal and PTO shift lever are not set a Neutral position**
  Release the HST pedal and shift the PTO shift lever to set the **Neutral** position.
  W1017957
When the HST pedal is not set at a Neutral position and the clutch pedal is not depressed
Release the HST pedal to set Neutral position and depress the clutch pedal.

When the PTO shift lever is not set at a Neutral position and the clutch pedal is not depressed
Shift the PTO shift lever to Neutral position and depress the clutch pedal.

When the HST pedal and PTO shift lever are not set a Neutral position, and clutch pedal is not depressed
Release the HST pedal and shift the PTO shift lever to set a Neutral position, and depress the clutch pedal.
(C) Service Interval Alert

The IntelliPanel display will alert the operator when the scheduled service is required.

**IMPORTANT**
- This display, SERVICE INSPECT, informs the operator that periodic maintenance service is due. It does not indicate system or product malfunction.

“SERVICE INSPECT” (1), is displayed in the LCD and the service indicator lamp (2) illuminates every 50 hours. This service alert indicator remains illuminated until the clearing operation is completed after the periodic maintenance is performed.

(Reference)
- It is possible to change to other standard display by pushing the display mode switch (3).

**Clearing Operation**:
- Keep pushing both switches (3), (4) for two seconds or more while displaying the hour meter (Normal Display 1).

(1) Periodic Service Required Readout
(2) Service Indicator Lamp
(3) Display Mode Switch
(4) Travel Speed Switch

(a) GST and HST Model
(b) Manual Transmission Model

(D) Warning Display or Warning Information

**Fuel Level Warning**

If the fuel in the tank goes below the prescribed level (less than 5 L, 1.3 U.S.gals, 1.1 Imp.gals), “FUEL” is displayed on the LCD (1) and the warning lamp (2) in the panel will come on. If this should happen during operation, refuel as soon as possible.

It is possible to return to Normal Display by pushing the display mode switch even if “FUEL” is displayed.

(1) Liquid Crystal Display (LCD)  (2) Fuel Level Warning Lamp
■ Overheating Warning

The IntelliPanel perceive the rise of coolant temperature, and has the function to display the overheat warning on the LCD.

When the coolant temperature becomes 125 °C (257 °F) or more, “OVERHEAT” (1) and “Eng SLOW” (2) are alternately displayed. Therefore, when these are displayed, lower the engine speed at once according to the message.

When the coolant temperature becomes 110 °C (230 °F) or less, “Eng STOP” (3) and “Check” (4) are alternately displayed. Therefore, when these are displayed, stop the engine and check the related place.

When the coolant temperature becomes 100 °C (212 °F) or less, Normal Display is displayed.

The warning lamp (6) comes on when the overheat display-1 (1) is displayed, and it keeps being on until water temperature is becoming 100 °C (212 °F) or less.

W1018762

■ Engine Oil Pressure and Electric Charging Warning

If the engine oil pressure goes below the 49 kPa (0.5 kgf/cm², 7.1 psi), the warning lamp (1) will come on. If this should happen during operation, and it does not go off when the engine is accelerated to more than 700 min⁻¹ (rpm), check level of engine oil.

If the alternator is not charging the battery, warning lamp (2) will come on. If this should happen during operation, check the charging system.

At above-mentioned the warning lamp’s lighting, and it informs warning.

W1018641
In this IntelliPanel, the control of various monitor lamps shown in figure are equipped in addition to warning lamps.

1. **Parking Brake Lamp**
   - If the parking brake is applied, parking brake switch is turned on and monitor lamp will come on.

2. **GST Warning Indicator Lamp (GST Model Only)**
   - If there have electrically problem in GST system, the GST warning indicator lamp will come on.

3. **Glow Indicator Lamp**
   - If the main switch is turned to “ON” position, the glow indicator lamp comes on, and goes off automatically when preheating is completed.

4. **Rear PTO Lamp**
   - If the PTO shift lever is “ON” position, PTO switch is turned on, and monitor lamp will come on.

5. **High Beam Indicator Lamp**
   - If the head light switch is turned to High beam position, the indicator lamp comes on.

6. **Shuttle Neutral Lamp**
   - (Manual and GST Model Only)
     - If the shuttle lever is set a Neutral position, this monitor lamp will come on.

7. **Cruise Lamp (HST Model Only)**
   - If the cruise control lever is at speed set position, the cruise lamp will come on.
(2) Assistant Control System

(A) Fail-safe Function

If a sensor or solenoid valve of the system gets in trouble during operation, an error message appears in the LCD screen of the IntelliPanel. The entire system adjusts itself on the safer side and keeps itself from getting into another trouble.

What's more, if the shift solenoid valve of the GST valve gets in trouble, the system adjusts itself to an accessible shift position or the neutral position no matter which position the shift lever stays in.

(B) Self-diagnosis Function

If any of the following troubles occurs, its related error code gets displayed flashing in the panel’s LCD screen as shown in figure. With the repair finished, the error code disappears. The error information will be, however, put in the memory device of the IntelliPanel and can be reviewed in the Error Information Display Mode (see page 9-S18). Such error information can also be deleted out of the error history by operating of Error Information Reset Mode (see page 9-S15).

(Error Messages)

■ For All Models
  ERROR-00: Electronic meter in trouble
  ERROR-20: Communication error (For GST model)

■ GST-specified meter wrongly installed on HST or Manual Transmission Model

■ For GST Model Only
  ERROR-30: ECU in trouble
  ERROR-40: Power supply of sensor from ECU in trouble
  ERROR-50: GST lever sensor in trouble
  ERROR-60: Proportional reducing valve in trouble
  ERROR-61: Shift solenoid 1 in trouble
  ERROR-62: Shift solenoid 2 in trouble
  ERROR-63: Shift solenoid 3 in trouble
  ERROR-64: Shift solenoid 4 in trouble
  ERROR-65: Shift solenoid 6 in trouble
  ERROR-66: Shift solenoid 5 in trouble

■ NOTE
  • See page 9-S4 about a detailed content of the error messages and their action method.

(A) The error message is displayed here.
"(C) Testing, Setting and Adjusting Function

It can do various settings, adjustments and testing by using the electronic instrument panel (IntelliPanel).

When the main switch is turned to **ON** or **START** position while pushing both the display mode switch (2) and the travel speed switch (3), the mode selection display as shown in figure is indicated. And then, a target mode is selected, the data input and the fine adjustment, etc. can be done.

The following table shows the content of each mode display by the alphabet.

W1019768
(D) Glow Control

The electronic meter incorporates the glow control which was external single parts so far, and controls it with CPU. When the main switch is turned ON, the temperature of the coolant is detected with the coolant temperature sensor, and the time to supply current to the glow plug and the glow indicator lamp is controlled by CPU according to the detected temperature. And the supply current to the glow plug is stopped automatically when the preheating time is completed, and monitor lamp on the electronic meter panel is turned off. (Refer to “STARTING SYSTEM”.)

4. CHECKING, DISASSEMBLING AND SERVICING

**CAUTION**
- To avoid accidental short circuit, be sure to attach the positive cable to the positive terminal before the negative cable is attached to the negative terminal.
- Never remove the battery cap while the engine is running.
- Keep electrolyte away from eyes, hands and clothes. If you are spattered with it, wash it away completely with water immediately.
- Keep open sparks and flames away from the battery at all times. Hydrogen gas mixed with oxygen becomes very explosive.

**IMPORTANT**
- If the machine is to be operated for a short time without battery (using a slave battery for starting), use additional current (lights) while engine is running and insulate terminal of battery. If this advice is disregarded, damage to alternator and regulator may result.

[1] BATTERY

(1) Checking

**Battery Voltage**
1. Stop the engine and turn the main switch off.
2. Connect the COM (−) lead of the voltmeter to the battery’s negative terminal post and the (+) lead to the positive terminal post, and measure the battery voltage.
3. If the battery voltage is less than the factory specification, check the battery specific gravity and recharge the battery.

<table>
<thead>
<tr>
<th>Battery voltage</th>
<th>Reference value</th>
<th>More than 12 V</th>
</tr>
</thead>
</table>

**Battery Terminal Connection**
1. Turn the main switch on, and turn on the head light.
2. Measure the voltage across the battery’s positive terminal post and the cable terminal, and the voltage across the battery’s negative terminal post and the chassis.
3. If the measurement exceeds the factory specification, clean the battery terminal posts and cable clamps, and tighten them firmly.

<table>
<thead>
<tr>
<th>Potential difference</th>
<th>Reference value</th>
<th>Less than 0.1 V</th>
</tr>
</thead>
</table>
Battery Specific Gravity

1. Check the specific gravity of the electrolyte in each cell with a hydrometer.
2. When the electrolyte temperature differs from that at which the hydrometer was calibrated, correct the specific gravity reading following the formula mentioned in (Reference).
3. If the specific gravity is less than 1.215 (after it is corrected for temperature), charge or replace the battery.
4. If the specific gravity differs between any two cells by more than 0.05, replace the battery.

**NOTE**
- Hold the hydrometer tube vertical without removing it from the electrolyte.
- Do not suck too much electrolyte into the tube.
- Allow the float to move freely and hold the hydrometer at eye level.
- The hydrometer reading must be taken at the highest electrolyte level.

(Reference)
- Specific gravity slightly varies with temperature. To be exact, the specific gravity decreases by 0.0007 with an increase of 1 °C (0.0004 with an increase of 1 °F) in temperature, and increases by 0.0007 with a decreases of 1 °C (0.0004 with a decrease of 1 °F).

Therefore, using 20 °C (68 °F) as a reference, the specific gravity reading must be corrected by the following formula:
- Specific gravity at 20 °C = Measured value + 0.0007 × (electrolyte temperature : 20 °C)
- Specific gravity at 68 °F = Measured value + 0.0004 × (electrolyte temperature : 68 °C)

[2] ELECTRONIC INSTRUMENT PANEL (INTELLIPANEL)

(1) Testing, Setting and Adjusting by Electronic Instrument Panel (IntelliPanel)

The following settings, adjustments and testing can be done by using the IntelliPanel.
- Testing : Check a voltage of various sensor or rotation of engine.
- Setting or Adjusting : Input the various data to IntelliPanel or ECU.
- Error Information : Confirm or clear the error information.

⚠️ CAUTION

- To perform the testing of the IntelliPanel the operator must be seated on the tractor.

### Mode Selection

Select a corresponded mode by the following procedure, and do the test, the adjustment, the setting, and the confirmation respectively.

1. While holding down both the display mode switch (2) and the travel speed switch (3) at once, turn the main switch to **ON** or **START** position.
2. Mode selection display is indicated on the LCD.
3. Press the display mode switch (2) and the flashing part moves.
4. Hold down the display mode switch (2) for more than 2 seconds, and the buzzer rings and flashing symbol is selected.

### NOTE

- To save entire and review the conditions, usually hold down the Display Mode switch (2) until the buzzer rings.
- When a setting has been saved or an adjustment mode in any mode, be sure to turn off the main switch to end the procedure.

Traveling Speed Coefficient Input Mode (Mode “B”)
(Input the 4 digit tire code for correct travel speed to the IntelliPanel memory panel)

**NOTE**
- When the tire size is changed or IntelliPanel is replaced, this operation is required.

1. Select the mode “B” (See page 9-S12 “Mode Selection”).
2. “0000” or the existing 4-digit numerical setting is displayed (b).
3. To change the code, select the appropriate code, referring to the tractor model and tire size.

**Numeric modification**
- Each time the display mode switch is pressed, the flashing number shifts. Press the travel speed switch to change the number.

4. Hold down the display mode switch for more than 2 seconds to preserve the code in the panel’s memory.
5. “OK” is displayed (c): The code has been input correctly.
   “NG” is displayed (d): Incorrect input. Repeat the procedure.
6. Turn off the main switch to end the mode “B”.

Error Information Reset Mode (Mode “D”)
(Delete the error information from the IntelliPanel)
1. Select the mode “D” (See page 9-S12 “Mode Selection”).
2. “CLEAR” is displayed (b) and “PUSH SW” is displayed (e) for 2 seconds.
3. Hold down the display mode switch for more than 2 seconds, and the error information is deleted.
4. “OK” is displayed (d): The IntelliPanel memory has been reset correctly.
   “NG” is displayed (e): The resetting process has failed. Repeat the procedure.
5. Turn off the main switch to end the mode “D”.

GST Lever Sensor Fine-adjustment (Mode “E”)  
(Setting the GST lever’s neutral position with its sensor)

**IMPORTANT**
- As for this fine-adjustment, be sure to set it correctly because the set state becomes the standard of the control thereafter.

**NOTE**
- When the GST lever sensor, the ECU or the IntelliPanel is replaced, this adjustment is required.

1. Set the GST shift lever to **Neutral** position.
2. Select mode “E” (See page 9-S12 “Mode Selection”).
3. “LEVER” is displayed (b) and “PUSH SW” is displayed (c) for five seconds.
4. Hold down the display mode switch for more than 2 seconds. 
   (This preserve the adjusted value to the ECU.)
5. “OK” is displayed (d) on LCD screen to tell that preserving to ECU has been made correctly. Turn off the main switch to end the mode.
   If “NG” is displayed (f), it means the preserving has not been made correctly (4). Turn off the main switch and repeat the procedure.
6. If “LEVER” is displayed (b) first and then “ERROR-70” shows up (e), it means the lever sensor voltage is out of specification. 
   In this case:
   - Check to see that GST lever is at the **Neutral** position.
   - Check the lever sensor voltage in the Test Mode (Mode “A”) (see page 9-S13). If out of specification, replace the sensor itself.
7. Turn off the main switch to end the mode “E”.

GST Valve Fine-adjustment Mode (Mode “F”)
(Setting the function of proportional reducing valve)

■ NOTE
- When the ECU or GST valve is replaced, this adjustment is required.
1. While holding down the both switches at once, start the engine.
2. Select mode “F” (See page 9-S12 “Mode Selection”).
3. “P-VALVE” is displayed (b) and STEP-01 (c) is displayed the 3 seconds after.

■ NOTE
- To make this adjustment, follow these steps in the exact order described. (Otherwise the switch does not work to go to next step. At “STEP-01” and “STEP-03”, however, the next step can be moved without their settings.)
- Push the display mode switch to move to the next step.
4. STEP-01 (c) : Release parking brake.
5. STEP-02 (d) : Set the engine speed at 1000 to 1400 min⁻¹ (rpm).
6. STEP-03 (e) : Set front tires straight ahead.
7. STEP-04 (f) : Operate the speed selection lever (GST lever) as follows ; disengaged the clutch, select “forward” with the shuttle lever, and shift the GST lever from 1 through 12 several times.
   Set the GST lever at the positions other than neutral.
8. STEP-05 (g) : Set the GST lever to Neutral position.
9. STEP-06 (h) : Set shuttle lever to forward and engage clutch.
10. PUSH SW (i) : Push the display mode switch for more than 3 seconds.
11. STEP-07 (j) : To preform this function the operator must be seated on the tractor.
   After a short delay the tractor will begin to move slowly. And then, after it moves a little, the tractor stops automatically. (Fine-adjustment is being executed.)
12. OK is displayed (k) : The setting has been preserved correctly to the ECU.
   NG is displayed (l) : The setting has not been correctly saved in the ECU. Repeat the entire procedure.

KiSC issued 02, 2007 A
■ GST Shift Shock Fine-adjustment Mode (Mode “G”)  
(Adjusting the clutch engaging interval)

■ NOTE
- When the sense of shifting shock is not suitable, shifting shock can be changed by this adjustment.
1. While holding down the both switches at once, start the engine.
2. Select mode “G” (See page 9-S12 “Mode Selection”).
3. “SHOCK” is displayed (b) first and then the numerical code setting is displayed (c).
   The number “−9” through “+9” can be displayed. This has been factory-adjusted to “0”.
4. Setting:
   - For lighter shifting shock;  
     Press the travel speed switch to reduce the number.
   - For higher shifting shock;  
     Press the display mode switch to increase the number.
5. Move the tractor to confirm the shifting shock.
6. Turn off the key. Then setting will be put in memory.

■ NOTE
- If the shift shock has been adjusted but no remarkable effect can be felt, keep the setting at “0”.

(a) Mode Selection Display  
(b) Information Display  
(c) Setting Number Display

■ Error Information Display Mode (Mode “H”)  
(Confirming or Reviewing the Error Information)
1. Select mode “H” (See page 9-S12 “Mode Selection”).
2. If there is not error information in memory, “NO ERROR” is displayed (b).
   If there is error information in memory, its information is displayed (c).
3. If there are two or more error information readouts, presses the display mode switch and the stored information can be reviewed one by one.
4. Turn off the main switch to end the mode “H”.

■ NOTE
- Even if a problem has been corrected or repaired, the information is displayed until it is deleted.
- Refer to “Error Information Reset Mode (Mode “D”) for deleting the error information.”
■ Transmission Model Input Mode (Mode “I”)  
(Input the transmission model into IntelliPanel)
■ NOTE
- When the IntelliPanel is replaced, this operation is required.
- On the HST models, the range gear shift lever sensor must be adjusted at the same time.
1. Select mode “I” (See page 9-S12 “Mode Selection”).
2. “MHG” is displayed (b), and the existing symbol setting is flashing.

(Reference)
- “M”: Manual Transmission Model
  “H”: HST Model
  “G”: GST Model
3. To change the setting, select either “G” or “M”, and input to the IntelliPanel. Each time display mode switch is pressed, the flashing symbol shifts. And then, hold down switch for more than 2 seconds with the symbol flashing.
4. “OK” is displayed (c): The tractor model has been input correctly.
   If “NG” is displayed (d): The tractor model has not been input correctly. Repeat the procedure.
5. Turn off the main switch to end the mode “I”.  

■ Adjustment of HST range gear shift lever sensor  
(for HST Model)
■ NOTE
- When the IntelliPanel or range gear shift sensor was replaced, this adjustment is required.
1. Set the range gear shift lever to the M position.
2. Select mode “I” and then select “H” of the HST model according to above procedure.
3. “OK” is displayed (c): Lever sensor voltage is as specified.
   “ERROR 71” is displayed (d) with buzzer: Lever sensor voltage is not specified.
   In this case;
   - Check to see that the range gear shift lever is at M position.
   - Check the lever sensor voltage in the Test Mode (Mode “A”) (see page 9-S13). If out of specification, replace the sensor.
4. Turn off the main switch to end the mode “I”.

(2) Checking Electrical Control System

CAUTION
- For checking of electric circuit, use the circuit tester and test function of IntelliPanel (See page 9-S13).
- As for the checking of sensors, switches and solenoid, do the following order; check the battery, fuse and grounding line first, check by the test function of IntelliPanel next, and check the connectors of panel or electronic control unit. If any defect is found there, check individual sensors, switches or solenoids to see whether the defect exists at the sensor, switch and solenoid side or at the wire harness side.
- When the normal function is restored as the result of replacement of the part which is suspected to see that the trouble is regenerated.

IMPORTANT
- When connecting or disconnecting the connector for the purpose of checking, be sure to turn OFF the main switch before hand. Moreover, pay attention not to allow the terminal to come in contact with other terminal or chassis while checking.
- When applying the test pin of the tester to the connector terminals, use care not to damage to the connector terminal.

(A) Check the Fuse and Connector

Checking Fuse
1. Check the fuse.
2. If any of the fuses is blown, replace it with the one having same capacity. (Refer to page G-36.)

IMPORTANT
- If a fuse is blown, check the cause and be sure to replace it with the one having same capacity.
Checking Grounding Wire
1. Check whether the grounding wire (1) is connected securely to the tractor chassis.
2. If the grounding wire is broken or disconnected, replace it.

(1) Grounding Wire
(A) Located at Left Side of Front Axle Frame
(B) Located at Left Side of Transmission Case

Checking Panel Connector
1. Disconnect the connectors (1), (2) and check their terminals for contamination and deformation.
2. Check to see that cable does not broken or terminals are not shelled off.
3. If any defective parts are found, repair or replace them.

■ IMPORTANT
• Connect connectors surely after checked.

(C) Unit Checking

Display Mode Switch and Travel Speed Switch
1. Check the resistance between the terminal a and terminal c while pushing the display made switch (1).
2. It is OK if 0 Ω is indicated.
3. Check the resistance between the terminal b and terminal c while pushing the travel speed switch (2).
4. It is OK if 0 Ω is indicated.
(1) Display Mode Switch (2) Travel Speed Switch

HST Range Gear Shift Lever Sensor Resistance
1. Measure the resistance between the terminal a and terminal b while shifting the range gear shift lever.
2. It is OK if the resistance is smoothly changing.
(Reference)
• The maximum resistance value is 4.32 to 6.48 kΩ.
(1) Range Gear Shift Lever Sensor
(3) Checking GST Electric Control System (GST Model Only)

(A) Checking Fuse and Connector

Checking Fuse
1. Check the fuse.
2. If any of the fuses is blown, replace it with the one having same capacity. (Refer to page G-36.)

- IMPORTANT
  - If a fuse is blown, check the cause and be sure to replace it with the one having same capacity.

Checking Grounding Wire
1. Check the whether the grounding wire (1) is connected securely to the tractor chassis.
2. If the grounding wire is broken or disconnected, replace it.

(1) Grounding Wire

Checking ECU Connector
1. Disconnect the connector (1), and check their terminals for contamination and deformation.
2. Check to see that cable does not broken or terminals are not shelled off.
3. If any defective parts are found, repair or replace them.

- IMPORTANT
  - Connect connectors surely after checked.

(1) ECU Connector (44P)

<td>Terminal 43 of ECU connector</td>
<td></td>
</tr>
</tbody>
</table>

A : Panel Connector B of Wire Harness Side  
B : ECU Connector B of Wire Harness Side  

### GST Lever Sensor Resistance

1. Measure the resistance between terminal a and c when the shaft is fully turned left.
2. Then, check resistance between terminal a and b while slowly turning the sensor shaft.
3. It is OK if the resistance value approximates to the value shown in the table below.

**Reference**
- The change of resistance can be checking easily when an analog tester is employed.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Terminal a - Terminal c</th>
<th>1.6 to 2.4 kΩ</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Terminal a - Terminal b</td>
<td>Resistance is normal if smoothly changing</td>
</tr>
</tbody>
</table>

### Pressure Switch Resistance

1. Disconnect the pressure switch connector (1).
2. Connect the circuit tester pins to each terminal of pressure switch (2).
3. Start the engine and depress the clutch pedal.
4. Check the resistance at time when shuttle lever or GST lever is shifted.
5. It is OK if the resistance comes to have shown in the table below.

**CAUTION**
- Be sure to depress the clutch pedal so that the tractor should not move while shifting each lever.

<table>
<thead>
<tr>
<th>Resistance between terminals</th>
<th>When the shuttle lever or GST lever is shifted</th>
<th>Continuity exists</th>
</tr>
</thead>
<tbody>

[3] STARTING SYSTEM
(1) Checking
(A) Main Switch (ROPS Type)

Remove the Main Switch
1. Remove the combination switch.
2. Remove the panel cover.
3. Disconnect the main switch connector.
4. Perform the following checking.

Connector Voltage
1. Measure the voltage between the terminal B and chassis.
2. If the voltage differs from the battery voltage (11 to 14 V), the wiring harness is faulty.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Terminal B – Chassis</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
</table>

A : Wire Harness Side Connector 4C
Main Switch at ON Position
1. Turn the main switch ON position.
2. Measure the resistance between the terminal B and the terminal AC.
3. If 0 Ω is not indicated, renew the main switch.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Terminal B – Terminal AC</th>
<th>0 Ω</th>
</tr>
</thead>
</table>

A : Main Switch Side Connector 4C

Main Switch at START Position
1. Turn and hold the main switch at the START position.
2. Measure the resistances between the terminal B and the terminal AC, and between the terminal B and the terminal ST.
3. If 0 Ω is not indicated, renew the main switch.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Terminal B – Terminal AC</th>
<th>0 Ω</th>
</tr>
</thead>
<tbody>
<tr>

</table>

(1) HST Neutral Switch (2) Switch Connector

Clutch Pedal Switch (For HST Model)
1. Remove the panel cover.
2. Disconnect the clutch pedal switch connector (2).
3. Measure the resistance between connector terminals while pushing the clutch pedal switch.
4. If 0 Ω is not indicated, switch is faulty.

(1) Clutch Pedal Switch (2) Clutch Pedal Switch Connector

(D) Starter and Starter Relay

Starter Motor B Terminal Voltage
1. Measure the voltage between the B terminal and chassis.
2. If the voltage differs from the battery voltage, check the battery’s cable.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Factory spec.</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
</table>

W1016256
Motor Test

⚠ CAUTION
- Secure the starter to prevent it from jumping up and down while testing the motor.
1. Disconnect the battery negative cable from the battery.
2. Disconnect the battery positive cable and the leads from the starter B terminal.
3. Remove the starter from the engine.
4. Disconnect the connecting lead (2) from the starter C terminal (1).
5. Connect a jumper lead from the connecting lead (2) to the battery positive terminal post.
6. Connect a jumper lead momentarily between the starter motor housing and the battery negative terminal post.
7. If the motor does not run, check the motor.

Magnet Switch Test (Pull-in, Holding Coils)
1. Remove the motor from the starter housing.
2. Prepare a 12 V battery for the test.
3. Connect jumper leads from the battery negative terminal to the housing and the starter C terminal.
4. The plunger should be attached and the pinion gear should pop out when a jumper lead is connected from the battery positive terminal to the S terminal. It’s a correct.
5. Disconnect the jumper lead to the starter C terminal. Then the pinion gear should remain popped out. It’s a correct.

► IMPORTANT
- Testing time must be 3 to 5 sec..

Checking Starter Relay
1. Remove the panel cover and meter panel. (See page 9-S23.)
2. Remove the starter relay.
3. Apply battery voltage between the terminal 3 and the terminal 4, and check the continuity of between the terminal 1 and the terminal 2.
4. If the continuity is not established, renew the starter relay.

A : Connector of Starter Relay
(E) Glow Control System

Glow Plug Lead Terminal Voltage
1. Disconnect the wiring lead (1) from the glow plug (2) after turning the main switch off.
2. Turn the main switch key to the “ON” position, and measure the voltage between the lead terminal and the chassis.
3. Turn the main switch key to the “START” position, and measure the voltage between the lead terminal and the chassis.
4. If the voltage at either position differs from the battery voltage, the wiring harness or main switch is faulty.

Glow Plug Continuity
1. Disconnect the lead from the glow plugs.
2. Measure the resistance between the glow plug terminal and the chassis.
3. If 0 Ω is indicated, the screw at the tip of the glow plug and the housing are short-circuited.
4. If the factory specification is not indicated, the glow plug is faulty.

Glow Relay

1) Connector Voltage
1. Turn the main switch off.
2. Disconnect the 4P connector from glow relay.
3. Measure the voltage across the terminal 3 (Positive) and chassis (Negative).
4. If the voltage differs from the battery voltage, the wiring harness is faulty.
5. Turn the main switch on.
6. Measure the voltage across the terminal 1 (Positive) and chassis (Negative).
7. If the voltage differs from the battery voltage, the wiring harness is faulty.

2) Glow Relay Test
1. Remove the glow relay.
2. Apply battery voltage between the terminal 3 and the terminal 4, and check the continuity of the terminal 1 and the terminal 2.
3. If the continuity is not established between terminal 1 and the terminal 2, replace the glow relay.

A : Connector of Wire Harness Side   B : Connector of Glow Relay
(F) Engine Stop Solenoid

Connector Voltage
1. Disconnect the 2P connector from engine stop solenoid.
2. Turn the main switch key to the “ON” position.
3. Measure the voltage between the terminal 1 (1), terminal 2 (2) and body.
4. If the voltage differs from the battery voltage, the wiring harness or main switch is faulty.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Terminal 1 – Body</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(1) Terminal 1</td>
<td>(2) Terminal 2</td>
</tr>
</tbody>
</table>

Stop Solenoid Coil
1. Disconnect the 2P connector from engine stop solenoid.
2. Measure the resistance between the terminal 1, terminal 2 and body.
3. If the resistance differs from the factory specification, the coil is faulty.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Terminal 1 – Body</th>
<th>Approx. 0.375 Ω</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(1) Terminal 1</td>
<td>(2) Terminal 2</td>
</tr>
</tbody>
</table>

Engine Stop Solenoid Relay
1) Connector Voltage
1. Turn the main switch off.
2. Disconnect the 4P connector from engine stop solenoid relay.
3. Measure the voltage between the terminal 3 (Positive) and chassis (Negative).
4. If the voltage differs from the battery voltage, the wiring harness is faulty.
5. Turn the main switch on.
6. Measure the voltage between the terminal 1 (Positive) and chassis (Negative).
7. If the voltage differs from the battery voltage, the wiring harness is faulty.

2) Engine Stop Solenoid Relay
1. Remove the engine stop solenoid relay.
2. Apply battery voltage between the terminal 3 and the terminal 4, and check the continuity of the terminal 1 and the terminal 2.
3. If the continuity is not established across terminal 1 and 2, replace the engine stop solenoid relay.

A : Connector of Wire Harness Side  B : Connector of Engine Stop Solenoid Relay
(2) Disassembling and Assembling

(A) Starter

Disassembling Motor
1. Disconnect the connecting lead (9) from the magnet switch (8).
2. Remove the screws (6), and then separate the end frame (4), yoke (2) and armature (1).
3. Remove the two screws (5), and then take out the brush holder (3) from the end frame (4).

(When reassembling)
- Apply grease to the spline teeth A of the armature (1).

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Nut (7)</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.9 to 11.8 N·m</td>
<td>0.6 to 1.2 kgf·m</td>
</tr>
<tr>
<td>4.3 to 8.7 ft-lbs</td>
<td></td>
</tr>
</tbody>
</table>

Disassembling Magnet Switch
1. Remove the drive end frame (1) mounting screws.
2. Take out the overrunning clutch (2), ball (3), spring (4), gears (5), rollers (6) and retainer (7).

(When reassembling)
- Apply grease to the gear teeth of the gears (5) and overrunning clutch (2), and ball (3).

<table>
<thead>
<tr>
<th>(1) Drive End Frame</th>
<th>(5) Gear</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2) Overrunning Clutch</td>
<td>(6) Roller</td>
</tr>
<tr>
<td>(3) Ball</td>
<td>(7) Retainer</td>
</tr>
<tr>
<td>(4) Spring</td>
<td></td>
</tr>
</tbody>
</table>

Plunger
1. Remove the end cover (1).
2. Take out the plunger (2).

(3) Servicing

Overrunning Clutch
1. Inspect the pinion for wear or damage.
2. If there is any defect, replace the overrunning clutch assembly.
3. Check that the pinion turns freely and smoothly in the overrunning direction and does not slip in the cranking direction.
4. If the pinion slips or does not rotate in both directions, replace the overrunning clutch assembly.
Commutator and Mica
1. Check the contact face of the commutator for wear, and grind the commutator with emery paper if it is slightly worn.
2. Measure the commutator O.D. with an outside micrometer at several points.
3. If the minimum O.D. is less than the allowable limit, replace the armature.
4. If the difference of the O.D.’s exceeds the allowable limit, correct the commutator on a lathe to the factory specification.
5. Measure the mica undercut.
6. If the undercut is less than the allowable limit, correct it with a saw blade and chamfer the segment edges.

<table>
<thead>
<tr>
<th></th>
<th>Factory spec.</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Commutator O.D.</td>
<td>30.0 mm 1.181 in.</td>
<td>29.0 mm 1.142 in.</td>
</tr>
<tr>
<td>Difference of O.D.’s</td>
<td>Less than 0.02 mm 0.0008 in.</td>
<td>0.05 mm 0.0020 in.</td>
</tr>
<tr>
<td>Mica undercut</td>
<td>0.50 to 0.80 mm 0.0197 to 0.0315 in.</td>
<td>0.20 mm 0.0079 in.</td>
</tr>
</tbody>
</table>

(1) Segment  (a) Correct  (2) Undercut  (b) Incorrect  (3) Mica

Brush Wear
1. If the contact face of the brush is dirty or dusty, clean it with emery paper.
2. Measure the brush length A with vernier calipers.
3. If the length is less than the allowable limit, replace the yoke assembly and brush holder.

<table>
<thead>
<tr>
<th>Brush length A</th>
<th>Factory spec.</th>
<th>Allowable limit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>15.0 mm 0.591 in.</td>
<td>11.0 mm 0.433 in.</td>
</tr>
</tbody>
</table>

Brush Holder
1. Check the continuity across the brush holder and the holder support with an ohmmeter.
2. If there is continuity, replace the brush holder.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Brush holder – Holder support</th>
<th>Infinity</th>
</tr>
</thead>
</table>
**Armature Coil**
1. Check the continuity across the commutator and armature coil core with an ohmmeter.
2. If there is continuity, replace the armature.
3. Check the continuity across the segments of the commutator with an ohmmeter.
4. If there is continuity, replace the armature.

**Field Coil**
1. Check the continuity of the lead (1) and brush (2) with an ohmmeter.
2. If it does not conduct, replace the yoke assembly.
3. Check the continuity of the brush (2) and yoke (3) with an ohmmeter.
4. If it conducts, replace the yoke assembly.

(1) Lead  (2) Brush  (3) Yoke
[4] CHARGING SYSTEM

(1) Checking

Alternator
1. Disconnect the 2P connector (3) from alternator after turning the main switch OFF.
2. Perform the following checkings.
   (1) B Terminal
   (2) Alternator
   (3) 2P Connector

Explanations:
- The checking process includes several steps to ensure the proper functioning of the alternator.
- The first step involves disconnecting the 2P connector to isolate the alternator.
- The subsequent checkings involve measuring voltages and verifying proper connections.

Connector Voltage
1. Turn the main switch OFF. Measure the voltage between the terminal B (1) and the chassis.
2. Turn the main switch ON. Measure the voltage between the terminal IG (3) and the chassis.

Explanations:
- The table shows the voltage measurements under different conditions.
- The measurements are taken with the main switch OFF and ON.
- The readings are compared to the factory specifications to ensure the alternator is functioning correctly.

No-Load Test
1. Connect the 2P connector (6) to previous positions of the alternator after turning the main switch OFF.
2. Connect the jumper lead (3) between terminal IG (4) and terminal B (2).
3. Start the engine and then set at idling speed.
4. Disconnect the negative cable from the battery.
5. Measure the voltage between the terminal B (2) and the chassis.
6. If the measurement is less than the factory specification, disassemble the alternator and check the IC regulator.

Explanations:
- The no-load test involves connecting the alternator to verify its ability to generate voltage under load conditions.
- The test results are compared to the factory specifications to ensure the alternator is functioning within expected parameters.

(Reference)
- Once the engine has started, the alternator temperature rises quickly up to an ambient temperature of 70 to 90 °C (158 to 194 °F). As the temperature goes higher than 50 °C (122 °F), the alternator voltage slowly drops; at higher than 100 °C (212 °F), it drops by about 1 V.
(2) Disassembling and Assembling

**Pulley**
1. Secure the hexagonal end of the pulley shaft with a double-ended ratchet wrench as shown in the figure, loosen the pulley nut with a socket wrench and remove it.

**(When reassembling)**

<table>
<thead>
<tr>
<th>Tightening torque</th>
<th>Pulley nut</th>
</tr>
</thead>
<tbody>
<tr>
<td>58.3 to 78.9 N·m</td>
<td>5.95 to 8.05 kgf·m</td>
</tr>
<tr>
<td>43.0 to 58.2 ft-lbs</td>
<td></td>
</tr>
</tbody>
</table>

**Rear End Cover**
1. Unscrew the three rear end cover screws and the B terminal nut, and remove the rear end cover.

**Brush Holder**
1. Unscrew the two screws holding the brush holder (1), and remove the brush holder (1).

(1) Brush Holder

**IC Regulator**
1. Unscrew the three screws holding the IC regulator (1), and remove the IC regulator (1).

(1) IC Regulator

**Rectifier**
1. Remove the four screws holding the rectifier (1) and the stator lead wires.
2. Remove the rectifier (1).

(1) Rectifier
Rear End Frame
1. Unscrew the two nuts and two screws holding the drive end frame and the rear end frame (1).
2. Remove the rear end frame (1).

Rotor
1. Press out the rotor (1) from drive end frame (3).

**IMPORTANT**
- Take special care not to drop the rotor and damage the slip ring or fan, etc..

Retainer Plate
1. Unscrew the four screws holding the retainer plate (1), and remove the retainer plate (1).

Bearing on Drive End Side
1. Press out the bearing from drive end frame (3) with a press and jig (1).

Bearing at Slip Ring Side
1. Lightly secure the rotor (1) with a vise to prevent damage, and remove the bearing (2) with a puller (3).
(3) Servicing

**Bearing**
1. Check the bearing for smooth rotation.
2. If it does not rotate smoothly, replace it.

**Stator**
1. Measure the resistance across each lead of the stator coil with an ohmmeter.
2. If the measurement is not within factory specification, replace it.
3. Check the continuity of each stator coil lead and core with an ohmmeter.
4. If infinity is not indicated, replace it.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Factory spec.</th>
<th>Less than 1.0 Ω</th>
</tr>
</thead>
</table>

**Rotor**
1. Measure the resistance across the slip rings with an ohmmeter.
2. If the resistance is not the factory specification, replace it.
3. Check the continuity of the slip ring and core with an ohmmeter.
4. If infinity is not indicated, replace it.

<table>
<thead>
<tr>
<th>Resistance</th>
<th>Factory spec.</th>
<th>2.9 Ω</th>
</tr>
</thead>
</table>

**Slip Ring**
1. Check the slip ring for score.
2. If scored, correct with an emery paper or on a lathe.
3. Measure the O.D. of slip ring with vernier calipers.
4. If the measurement is less than the allowable limit, replace it.

<table>
<thead>
<tr>
<th>Slip ring O.D.</th>
<th>Factory spec.</th>
<th>14.4 mm 0.567 in.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowable limit</td>
<td>12.8 mm 0.504 in.</td>
<td></td>
</tr>
</tbody>
</table>

**Brush Wear**
1. Measure the brush length with vernier calipers.
2. If the measurement is less than allowable limit, replace it.
3. Make sure that the brush moves smoothly.
4. If the brush is defective, replace it.

<table>
<thead>
<tr>
<th>Brush length</th>
<th>Factory spec.</th>
<th>10.5 mm 0.413 in.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowable limit</td>
<td>8.4 mm 0.331 in.</td>
<td></td>
</tr>
</tbody>
</table>
Rectifier
1. Check the continuity of each diode of rectifier with an analog ohmmeter. Conduct the test in the (R × 1) setting.
2. The rectifier is normal if the diode in the rectifier conducts in one direction and does not conduct in the reverse direction.

■ IMPORTANT
- Do not use a 500 V megger for measuring because it will destroy the rectifier.

■ NOTE
- Do not use an auto digital multimeter. Because it’s very hard to check the continuity of rectifier by using it.

IC Regulator
1. Check the continuity of the terminal B and the terminal F of IC regulator with an analog ohmmeter. Conduct the test in the (R × 1) setting.
2. The IC regulator is normal if the IC regulator conducts in one direction and does not conduct in the reverse direction.

■ IMPORTANT
- Do not use a 500 V megger for measuring because it will destroy the IC regulator.

■ NOTE
- Do not use an auto digital multimeter. Because it’s very hard to check the continuity of IC regulator by using it.
[5] LIGHTING SYSTEM

(1) Checking

(A) Combination Switch

Remove the Combination Switch
1. Remove the panel cover, and disconnect the combination switch connector (2) after turning the main switch OFF position.
2. Perform the following checkings.

1) Connector Voltage
   1. Disconnect the 8P connector from the combination switch.
   2. Measure the voltage between the terminal B1 and chassis, and between the terminal B2 and chassis when the main switch is “OFF” position.
   3. If the voltage differs from 0 V, the wiring harness is faulty.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Main switch at “OFF” position</th>

(13) Air Conditioner Unit
(14) Compressor
(15) Receiver
(16) Condenser
The machine is equipped with a thin large-capacity air conditioner with outside air intake. Through the inside air filter (7) as well as the outside air filter (5), the inner roof (6) and reaches the air conditioner unit (13). The air is then cooled and defumidified by this unit.

The resulting air is heated to a comfortable level. In this way, the air being blown via the blow port can be kept at comfortable temperature and humidity.

The front air outlet (9) can be opened and closed using the center knob of each port. The side air outlet (8) are opened and closed using the mode lever on the control panel (3). With these ports open or closed, you can feel your head cool and your feet warm.

**NOTE**
- As for the mechanism and function of each component part, refer to Workshop Manual of “MECHANISM”.
- **Compressor Oil**

The compressor oil dissolves in the refrigerant, circulates through the air-conditioning cycle, and functions to lubricate the compressor. But the conventional compressor oil for R12 doesn’t dissolve in R134a, so it doesn’t circulate through the cycle, and the lifespan of the compressor is considerably shortened.

It is still essential to ensure that the correct refrigerant oil is used. R12 systems were lubricated with mineral oil, which is totally unsuitable for R134a systems. The letter require PAG oil, which mixes very well with the refrigerant and provides ideal lubrication throughout the system.

(4) Heater Unit

KiSC issued 02, 2007 A
[2] SYSTEM CONTROL

(1) A/C Model

1) Selection of recirculated air (7) or fresh air (5) is done with door D1.
   - **RECIRC**
     By setting the air selection lever (16) in rear control panel to **RECIRC** position, door D1 (6) shuts the fresh air inlet port. Air inside the cabin is recirculated.
   - **FRESH**
     By moving the air selection lever (16) to **FRESH** position, door D1 opens the fresh air inlet port. Outside air comes into cabin.

2) Temperature control of outlet air is done with door D2.
   - **COOL**
     By setting the temperature control lever (4) in control panel to **COOL** position, door D2 (10) is moved to close water valve. The air flows to door D3 (12) side without passing the heater core.
   - **WARM**
     By moving the temperature lever to **WARM** position door D2 (10) is moved to open water valve. The air flows to door D3 (12) side passing through the heater core.

3) Outlet air flow is controlled by door D3.
   Moving the air mode lever (1) opens and shuts door D3 and establishes the air passage according to the lever position.
   - **DEF + FACE**
     By moving the mode lever to **DEF + FACE** position, the door D3 (12) is moved to establish the air passages to outlets O1 and O2. Air comes out from both outlets.
   - **DEF**
     Moving the mode lever to **DEF** position, door D3 is moved to set up the air passage to outlet O1. Air comes out from outlet O1.
(2) Heater Model

1) Selection of recirculated air (6) or fresh air (4) is done with door D1.
   - RECIRC
     By setting the air selection lever (14) in rear control panel to RECIRC position, door D1 (5) shuts the flesh air inlet port. Air inside the cabin is recirculated.
   - FRESH
     By moving the air selection lever (14) to FRESH position, door D1 opens the flesh air inlet port. Outside air comes into cabin.

2) Temperature control of outlet air is done with door D2.
   - COOL
     By setting the temperature control lever (3) in control panel to COOL position, door D2 (8) is moved to close water valve. The air flows to door D3 (10) side without passing the heater core.
   - WARM
     By moving the temperature lever to WARM position door D2 (8) is moved to open water valve. The air flows to door D3 (10) side passing through the heater core.

3) Outlet air flow is controlled by door D3.
   - Moving the air mode lever (1) opens and shuts door D3 and establishes the air passage according to the lever position.
   - DEF + FACE
     By moving the mode lever to DEF + FACE position, the door D3 (10) is moved to establish the air passages to outlets O1 and O2. Air comes out from both outlets.
   - DEF
     Moving the mode lever to DEF position, door D3 is moved to set up the air passage to outlet O1. Air comes out from outlet O1.
[3] ELECTRICAL SYSTEM

(1) Electrical Circuit

The process of magnetic clutch being engaged is shown below.

Main Switch (3) ON → A/C Switch (10) ON → Blower Switch (10) ON (Low, medium or High) → Compressor Relay Contact (6) → Thermo Switch (7) ON (the thermostat temperature is more than 4 °C (39.2 °F)) → Pressure Switch (8) ON (if refrigerant pressure is between 0.21 MPa (2.1 kgf/cm², 30 psi) and 2.65 MPa (27 kgf/cm², 384 psi) → Magnetic Clutch of Compressor (7) Engaged.
(2) Air Conditioner Relay, Blower Relays and Compressor Relay

Remove the outer roof and the relays are visible at the ceiling center of the cabin: blower relay (1) and compressor relay (2). When the blower fan is adjusted for the air flow rate, the blower relay (1) is activated by a signal from the fan switch on the control panel.

Among the air conditioner components, current flows to the blower motor (7) and magnetic clutch. If all of these current were to be passed through the main switch (5) and supplied, the current would be too large for the main switch (5) so that there will be danger or burning out the main switch contact. If the current were to be passed directly from the battery (3), forgetting to turn off the blower motor (7) could result in a discharged battery (3).

To protect against such trouble, relays have been provided. These relays have been made so that when current flows through its coil, the contact close to supply the power from the battery (3). By employing these relays, the current flowing through the main switch (5) has been decreased as only a small current is required to actuate the relay. Thus there will be no danger of burning out the switch contact, and when the main switch (5) is opened, the relay contact will open at the same time. This action stops the current flow in the air conditioner circuit so that there will also be no chance of the battery discharging.

(1) A/C Blower Relay  (2) Compressor Relay  (3) Battery  (4) Slow Blow Fuse
(5) Main Switch  (6) A/C Blower Switch  (7) A/C Blower Motor  (8) A/C Blower Resistor

W1013825
(3) Air Conditioner Blower Switch

■ When Blower Switch is in · (Low), · (Medium) or ● (High) Position

When the main switch (3) is turned ON, the current flows from battery (1) to A/C blower relay coil and A/C relay is turned ON. As the A/C relay is turned ON, the current from battery (1) flows to A/C blower switch through the A/C blower motor as follows.

“·” (Low) Position
Battery (1) → Slow Blow Fuse (2) → Main Switch (3) → Fuse (7.5 A) → A/C Blower Relay Contact (12) → Blower Motor (13) → Blower Resistor (14) → A/C Blower Switch (10) (LO Position) → Ground.

“·” (Medium) Position
Battery (1) → Slow Blow Fuse (2) → Main Switch (3) → Fuse → A/C Blower Relay Contact (12) → Blower Motor (13) → Blower Resistor (14) → A/C Blower Switch (10) (ME Position) → Ground.

“●” (High) Position
Battery (1) → Slow Blow Fuse (2) → Main Switch (3) → Fuse → A/C Blower Relay Contact (12) → A/C Blower Motor (13) → A/C Blower Switch (10) (HI Position) → Ground.

Symptom

Is cycle pressure as specified?

No

Is high-pressure level as specified?

No
too high

Normal

Yes
too low

Is low-pressure level as specified?

No
too high

Are both high-pressure and low-pressure levels as specified?

No
too low

Is temperature well controlled?

No

normal

Does temperature control lever function?

No

normal

Is water valve openness as specified?

No

normal

Is air mixing door openness as specified?

No

normal

Is heater hose laid as specified?

No

normal

Check water leakage

Abnormal

Check two points (in cabin’s right-hand front and back) for drainage of water resulting from dehumidifying.

Is there water leak in cabin?

No

normal

Probable Cause

Refrigerant overcharged

Condenser clogged with dust and dirt

Air mixed

Refrigerant too short

Compressor discharge valve damaged

Compressor gasket damaged

Low-pressure pipe in trouble (Cracked or clogged)

Refrigerant overcharged

Heat-sensitive tube in poor contact

Expansion valve too open

Refrigerant too short

Gas leak at heat-sensitive tube

Evaporator frosted

Low-pressure pipe in trouble (Cracked or clogged)

Expansion valve clogged

Refrigerant overcharged

Refrigerant too short

Wire poorly fixed

Wire wrongly laid

Valve wrongly open at Max COOL position

Cable wrongly set

Cable disconnected

Damper lever wrongly set

Cable disconnected

Hose caught

Hose twisted or bent

Drain hose disconnected

Drain hose bent

Heater hose in poor connection

4. PRECAUTIONS AT REPAIRING REFRIGERANT CYCLE

When checking or repairing the air conditioning system, the following precautions and rules must be observed. And it is of first importance that no other personnel than a well-trained serviceman should be allow to handle the refrigerant.

⚠️ CAUTION

- Since direct contact of the liquid refrigerant with your skin will cause frostbite, always be careful when handling the refrigerant. Always wear goggles to protect your eyes when working around the system.
- The refrigerant service container has a safe strength. However, if handled incorrectly, it will explode. Therefore, always follow the instructions on the label. In particular, never heat the refrigerant container above 40 °C (104 °F) or drop it from a high height.
- Do not steam clean on the system, especially condenser since excessively high pressure will build up in the system, resulting in explosion of the system.
- If you improperly connect the hose between the service valve of compressor and gauge manifold, or incorrectly handle the valves, the refrigerant service container or charging hose will explode. When connecting the hose or handling the valve, be sure to check the high pressure side or low pressure side.
- In case the refrigerant is charged while the compressor is operated, do not open the high pressure valve of the gauge manifold.
- Beware of the toxicity of the gas. The gas is harmless and nontoxic in its original state, however it produces a toxic substance when it comes in contact with high temperature parts and decomposes.
- Do not heat the service can unless necessary. When it has to be heated, use warm water of 40 °C (104 °F) or lower. Do not heat using boiling water.

■ IMPORTANT

- If the refrigerant, O-rings, etc. for R12 are used in the R134a air conditioner system, problems such as refrigerant leakage or cloudiness in the sight glass may occur. Therefore, in order to prevent charging of refrigerant or erroneous connections, the shapes of the piping joint as well as the shapes of the service valve and the service tools have been changed.
- Always keep the working place clean and dry and free from dirt and dust. Wipe off water from the line fittings with a clean cloth before disconnecting.
- Use only for R134a refrigerant service tool.
- Use for R134a refrigerant recovery and recycling machine when discharging the refrigerant.
- Before attaching the charging hose to the can tap valve of the refrigerant container, check each packing for clogging.
- When disconnecting the charging hose from the charging valve of compressor and receiver, remove it as quick as possible so that gas leakage can be minimized.
- Be sure to charge the specified amount of refrigerant, but not excessively. Over-charging of the refrigerant in particular may cause insufficient cooling, etc..
- Since the charging hose can be connected to can tap valve by hand, do not use a pliers for tightening it.
- Keep refrigerant containers in a cool and dark place avoiding such place which are subject to strong sunlight or high temperature.
- R134a compressor oil absorbs moisture easily, so that be sure to seal after disconnecting the each parts.
- Do not use old-type refrigerant R12a or compressor oil for old-type refrigerant.
- When replacing the condenser, evaporator and receiver, etc., replenish the compressor oil to compressor according to the table below.

*PAG : Polyalkyleneglycol (Synthetic oil)
[1] HANDLING OF SERVICE TOOLS

(1) Manifold Gauge Set

The hand valves on the manifold gauge set are used to open and close the valve. The hand valve inscribed LO is for the low pressure side valve (3) and HI is for the high pressure side valve (4). By opening or closing the high and low pressure hand valves, the following circuits are established.

- **When LO Pressure Side Valve and HI Pressure Side Valve are Closed**
  - Two circuits are established.
  - Port (C) → LO pressure gauge (1)
  - Port (A) → HI pressure gauge (2)

- **NOTE**
  - Schrader valve (D) must be opened.

- **When LO Valve is Opened and HI Valve is Closed**
  - Two circuits are established.
  - Port (C) → LO pressure gauge (1)
  - Port (B) → Port (D)
  - Port (A) → HI pressure gauge (2)

- **NOTE**
  - Schrader valve (D) must be opened.

- **When LO Valve is Closed and HI Valve is Opened**
  - Two circuits are established.
  - Port (C) → HI pressure gauge (2)
  - Port (B) → Port (D) (Schrader valve must be opened)
  - Port (A) → LO pressure gauge (1)

- **NOTE**
  - Schrader valve (D) must be opened.

- **When LO and HI Valve are Opened**
  - Circuits are established.
  - Port (A) → HI pressure gauge (2)
  - Port (B) → LO pressure gauge (1)
  - Port (C) → Port (D) (Schrader valve must be opened)

- **NOTE**
  - Schrader valve (D) must be opened.
(2) Refrigerant Charging Hose

The charging hoses are classified into three colors. Each charging hose must be handled as follows:

- The air conditioner manufacturer recommends that the blue hose (3) is used for the LO pressure side (suction side), the green hose (5) for refrigeration side (center connecting port) and the red hose (4) for HI pressure side (discharged side).

(When connecting)
- Push the quick disconnect adaptor (6) into the charging valve, and push on part A until a click is heard.

**NOTE**
- When connecting, push carefully so the pipe doesn’t bend.
- When connecting the quick disconnect connector, should the sleeve (7) move before the quick link connector can be connected to the charging valve, move the quick sleeve to its original position and try again.
- When some refrigerant remains in the charging hose at the time of connections, it may be difficult to connect the quick link connector. In this case, perform the operation after removing any residual pressure in the hose. (Remove the residual pressure by pushing the pusher (8).)

(When reassembling)
- While holding on to part A of the quick disconnect adaptor, slide part B up.

**NOTE**
- After removing the adaptor, ensure to cap the quick disconnect adaptor service valve.

<table>

</tr>
</tbody>
</table>
Objective of the Vacuum Pump Adaptor

1. After vacuum has been created in the air conditioning cycle, when the vacuum pump is stopped, since there is vacuum in hoses within the gauge manifold, the vacuum pump oil flows back into the charging hose. If the refrigerant is refilled with the system still in this state, the vacuum pump oil left in the charging hose enters the air conditioner cycle together with the refrigerant. Vacuum pump adaptor with a solenoid valve is used to prevent this back-flow of oil from the vacuum pump. The role of the solenoid valve is that when the current passes through the solenoid valve, the valve closes to keep out the outside air and allow the vacuum to build up, but when the current stops, the valve opens to allow in air and end the vacuum.

2. Attaching this adaptor to the R12 vacuum pump currently being used allows the pump to be used with both R134a and R12.

(4) Electric Gas Leak Tester

The current R12 gas leak tester has poor sensitivity for R134a and cannot be used. Therefore, a new electric gas leak tester with greater sensitivity has been designed and can be used with both R134a and R12.

(Reference)
Leak tester with halide torch
- Since the reaction with chlorine within the refrigerant is used to detect gas leaks, R134a, which contains no chlorine, cannot be detected.

(5) Can Tap Valve

The can tap valve that is used to charge the refrigerant into the air conditioning system, should be used as follows:
1. Before putting the can tap valve on the refrigerant container, turn the handle (1) counterclockwise till the valve needle is fully retracted.
2. Turn the plate nut (disc) (4) counterclockwise till it reaches its highest position, then screw down the can tap valve into the sealed tap.
3. Turn the place nut clockwise fully, and fix the center charging hose to the valve.
4. Tighten the place nut firmly by hand.
5. Turn the handle (1) clockwise, thus making a hole in the sealed tap.
6. To charge the refrigerant into the system, turn the handle (1) counterclockwise. To stop charging, turn it clockwise.
(6) **T-joint**

T-joint (2) is used to increase efficiency of gas charging using two refrigerant containers (4) at a time.

1. Install two refrigerant container service valves to T-joint (2) sides and connect the charging hose (1) to it.

   (1) Charging Hose (Green)  
   (2) T-joint  
   (3) Can Tap Valve  
   (4) Refrigerant Container

(7) **R134a Refrigerant Recovery and Recycling Machine**

When there is necessity of discharging the refrigerant on repairing the tractor, it should use recovery and recycling machine. (Don't release the refrigerant into the atmosphere.)

■ **IMPORTANT**
- Use only R134a refrigerant recovery and recycling machine, eliminate mixing R134a equipment, refrigerant and refrigerant oils with R12 systems to prevent compressor damage.
5. CHECKING AND CHARGING REFRIGERANT CYCLE

[1] CHECKING WITH MANIFOLD GAUGE

■ IMPORTANT
- The gauge indications described in the following testing are those taken under the same condition, so it should be noted that the gauge readings will differ somewhat with the ambient conditions.

Condition
- Ambient temperature: 30 to 35 °C (86 to 95 °F)
- Engine speed: Approx. 1500 min⁻¹ (rpm)
- Temperature control lever: Maximum cooling position
- Air-Conditioner switch: ON
- Blower switch: HI position

Manifold Gauge Connecting and Test Preparation
1. Close the manifold gauge HI and LO pressure side valve (7), (6) tightly.
2. Connect the charging hose (1) (red) to the HI pressure side charging valve (2) and connect the charging hose (4) (blue) to the LO pressure side charging valve (3).

■ NOTE
- Be sure to drive out the air in the charging hoses at the manifold gauge connection end by utilizing the refrigerant pressure in the refrigerating cycle.
3. Start the engine and set at approx. 1500 min⁻¹ (rpm).
4. Turn on the A/C switch and set the temperature control lever to maximum cooling position.
5. Set the blower switch to HI position.

Normal Operating
If the refrigerating cycle is operating normally, the reading at the LO pressure side (1) should be generally by around 0.15 to 0.2 MPa (1.5 to 2.0 kgf/cm², 21 to 28 psi) and that at the HI pressure side (2) around 1.27 to 1.66 MPa (13 to 17 kgf/cm², 185 to 242 psi).

W1015662
W1015870
**Insufficient Refrigerant**

1. Symptoms seen in refrigerating cycle
   - Both LO and HI pressure side (1), (2) pressures too low.
     - LO pressure side (1) : 0.05 to 0.1 MPa
       (0.5 to 1.0 kgf/cm², 7.1 to 14.2 psi)
     - HI pressure side (2) : 0.69 to 0.98 MPa
       (7 to 10 kgf/cm², 99.6 to 142.2 psi)
   - Bubbles seen in sight glass.
   - Air discharged from air conditioner slightly cold.

2. Probable cause
   - Gas leaking from some place in refrigerant cycle.

3. Solution
   - Check for leakage with electric gas leak tester (see page 10-S11) and repair.
   - Recharge refrigerant to the proper level. (See page 10-S21.)

---

**Excessive Refrigerant or Insufficient Condenser Cooling**

1. Symptoms seen in refrigerating cycle
   - Both LO and HI pressure side (1), (2) pressures too high.
     - LO pressure side (1) : 0.2 to 0.35 MPa
       (2.0 to 3.5 kgf/cm², 28 to 49.8 psi)
     - HI pressure side (2) : 1.96 to 2.45 MPa
       (20 to 25 kgf/cm², 284.5 to 355.6 psi)
   - LO pressure side (1) piping not cold when touched.

2. Probable cause
   - Overcharging refrigerant into cycle.
   - Condenser cooling faulty.

3. Solution
   - Clean condenser. (See page G-31.)
   - Adjust air conditioner belt to proper tension. (See page G-29.)
   - If the above two items are in normal condition, check refrigerant quantity. (See page 10-S21.)

**NOTE**
- If excessive refrigerant is to be discharged, loosen manifold gauge LO pressure side valve and vent out slowly.

---

**Air Entered in the Cycle**

1. Symptoms seen in refrigerating cycle
   - Both LO and HI pressure side (1), (2) pressures too high.
     - LO pressure side (1) : 0.2 to 0.35 MPa
       (2.0 to 3.5 kgf/cm², 28 to 49.8 psi)
     - HI pressure side (2) : 1.96 to 2.45 MPa
       (20 to 25 kgf/cm², 284.5 to 355.6 psi)
   - LO pressure side (1) piping not cold when touched.

2. Probable cause
   - Air entered in refrigerating cycle.

3. Solution
   - Replace receiver.
   - Check compressor oil contamination and quantity.
   - Evacuate and recharge new refrigerant. (See page 10-S19, S20.)

**NOTE**
- The above cycle can be seen when the cycle is charged without evacuation.
Moisture Entered in the Cycle
1. Symptoms seen in refrigerating cycle
   - The air conditioner operates normally at the beginning, but over time, LO pressure side (1) pressure is vacuum and HI pressure side (2) is low pressure.
   LO pressure side (1) : Vacuum
   HI pressure side (2) : 0.69 to 0.98 MPa
   (7 to 10 kgf/cm², 99.6 to 142.2 psi)
2. Probable cause
   - The moisture in the refrigerating cycle freezes in the expansion valve orifice and causes temporary blocking. After a time, the ice melts and condition returns to normal.
3. Solution
   - Replace receiver.
   - Remove moisture in cycle by means of repeated evacuation. (See page 10-S17.)
   - Recharge new refrigerant to the proper level. (See page 10-S21.)

Refrigerant Fails to Circulate
1. Symptoms seen in refrigerating cycle
   - LO pressure side (1) pressure is vacuum and, HI pressure side (2) is low pressure.
   LO pressure side (1) : Vacuum
   HI pressure side (2) : 0.49 to 0.59 MPa
   (5 to 6 kgf/cm², 71.2 to 85.3 psi)
   - Frost or dew formed on piping at front and rear sides of expansion valve or receiver.
2. Probable cause
   - Refrigerant flow obstructed by moisture or dirt in the refrigerating cycle freezing or sticking on the expansion valve orifice.
3. Solution
   - Allow to stand for same time and then resume operation to decide whether the plugging is due to moisture or dirt.
   - If caused by moisture, correct by referring to instructions in previous.
   - If caused by dirt, remove the expansion valve and blow out the dirt with compressed air.
   - If unable to remove the dirt, replace the expansion valve.
   Replace the receiver. Evacuate and charge in proper amount of new refrigerant. (See page 10-S18 to S20.)
   - If caused by gas leakage in heat sensitizing tube, replace the expansion valve.
Expansion Valve Opens Too Far or Improper Installation of Heat Sensitizing Tube

1. Symptoms seen in refrigerating cycle
   - Both LO and HI pressure side (1), (2) pressures too high.
     - LO pressure side (1) : 0.29 to 0.39 MPa
       (3.0 to 4.0 kgf/cm², 42.71 to 56.9 psi)
     - HI pressure side (2) : 1.96 to 2.45 MPa
       (20 to 25 kgf/cm², 284.5 to 355.6 psi)
   - Frost or heavy dew on low pressure side piping.
2. Probable cause
   - Expansion valve trouble or heat sensitizing tube improperly installed.
   - Flow adjustment not properly done.
3. Solution
   - Check installed condition of heat sensitizing tube.
   - If installation of heat sensitizing tube is correct, replace the expansion valve.

Faulty Compression of Compressor

1. Symptoms seen in refrigerating cycle
   - LO pressure side (1) pressure too high : 0.39 to 0.59 MPa (4 to 6 kgf/cm², 56.9 to 85.3 psi)
   - HI pressure side (2) pressure too low : 0.69 to 0.98 MPa (7 to 10 kgf/cm², 99.6 to 142.2 psi)
2. Probable cause
   - Leak in compressor.
3. Solution
   - Replace compressor. (See page 10-S29.)

NOTE
- Manifold gauge indications (left side figure) at faulty compressing by compressor.

W1017612
W1017960
[2] DISCHARGING, EVACUATING AND CHARGING

■ IMPORTANT
- When discharging, evacuating or charging the refrigerating system, be sure to observe the “PRECAUTION AT REPAIRING REFRIGERANT CYCLE”. (See page 10-S8.)

(1) Discharging the System

Prepare for the R134a refrigerant recovery and recycling machine.
1. Connect low pressure side hose (blue) from the recovery and recycling machine to LO pressure side charging valve (3) on the compressor (1). Connect high pressure side hose (red) to HI pressure side charging valve (2) on the compressor (1).
2. Follow the manufacturers instructions and discharge the system.

■ IMPORTANT
- Use only R134a refrigerant recovery and recycling machine.
- Eliminate mixing R134a equipment, refrigerant, and refrigerant oils with R12 systems to prevent compressor damage.

CAUTION
- Protect fingers with cloth against frostbite by refrigerant when disconnecting the hose to the charging valve.

W1018328

(2) Evacuating the System

![Diagram of evacuation process]

- Begin Creating Vacuum
- Stop Creating Vacuum
- Checking Air Tightness
- Charging Refrigerant
- Gas Leak Testing
- Filling Refrigerant (98 kPa, 1 kgf/cm², 14 psi)

Approx. 15 minutes 750 mmHg (229 in.Hg) or more

Leave for 5 minutes
**Evacuating the System**

1. Discharge refrigerant from the system by R134a refrigerant recovery and recycling machine. (Refer to “Discharging the system”.)

2. Connect the charging hose (7) (red) to the HI pressure side charging valve and connect the charging hose (9) (blue) to the LO pressure side charging valve.

3. Connect the center charging hose (8) (green) to a vacuum pump inlet.

4. Open both valves (6), (10) of manifold gauge fully. Then run the vacuum pump (1) to evacuate the refrigerant cycle. (For approx. 15 minutes.)

5. When LO pressure gauge (10) reading is more than 750 mmHg (299 in.Hg), stop the vacuum pump (8) and close both valves (6), (10) of manifold gauge fully.

6. Wait for over 5 minutes with the HI and LO pressure side valves (6), (10) of gauge manifold closed, and then check that gauge indicator does not return to 0.

7. If the gauge indicator is going to approach to 0, check whether there is a leaking point and repair if it is, and then evacuate it again.

---

(1) Vacuum Pump (Running)  (6) HI Pressure Side Valve (Open)
(2) Vacuum Pump Adaptor  (7) Red Hose
(3) LO Pressure Gauge  (8) Green Hose
(4) HI Pressure Gauge  (9) Blue Hose
(5) Compressor  (10) LO Pressure Side Valve (Close)
(3) Charging the System

Charging an Empty System (Liquid)

This procedure is for charging an empty system through the 
pressure side with the refrigerant in the liquid state.

**CAUTION**

- Never run the engine when charging the system through the 
  HI pressure side.
- Do not open the LO pressure valve when refrigerant R134a 
  is being charged in the liquid state (refrigerant container is 
  placed upside-down).

**IMPORTANT**

- After charging the refrigerant in the liquid state with approx. 
  500 g (1.1 lbs) through the HI pressure side, be sure to 
  recharge the refrigerant in the vapor state to specified 
  amount through the LO pressure side.

1. Close the HI and LO pressure side valves (5), (6) of manifold 
   gauge after the system is evacuated completely.
2. Connect the center charging hose (2) to the can tap valve (7) 
   fitting, and then loosen the center charging hose at the center 
   fitting of manifold gauge until hiss can be heard. 
   Allow the air to escape for few seconds and tighten the nut.
3. Open the HI pressure side valve (5) fully, and keep the container 
   upside-down to charge the refrigerant in the liquid state from the 
   HI pressure side.
4. Charge the refrigerant in the liquid state with approx. 500 g (1.1 
   lbs) from the HI pressure side.

**NOTE**

- If LO pressure gauge does not show a reading, the system 
  is clogged and must be repaired.
5. Close the HI pressure side valve (5) of manifold gauge and can 
   tap valve of refrigerant container.

(1) Refrigerant Container (R134a)   (7) Can Tap Valve (Open)
(2) Green Hose                     (8) Compressor
(3) Red Hose                       A : Air Purge
(4) Blue Hose                      B : Loosen the Nut
(5) HI Pressure Side Valve (Open)   C : Open the Can Tap Valve
(6) LO Pressure Side Valve (Close)  

W1018931
Charging an Empty or Partially Charged System (Vapor)

This procedure is to charge the system through the LO pressure side with refrigerant in the vapor state. When the refrigerant container is placed right side up, refrigerant will enter the system as a vapor.

⚠️ CAUTION
- Never open the HI pressure valve of manifold gauge while the engine is running.

■ NOTE
- Do not turn the refrigerant container upside-down when charging the system by running the engine.
- Put refrigerant container into a pan of warm water (maximum temperature 40 °C (104 °F)) to keep the vapor pressure in the container slightly higher than vapor pressure in the system.

1. Check that the HI pressure valve (5) is closed.
2. Start the engine and set an approx. **1500 min⁻¹** (rpm).
3. Turn on the A/C switch.
   - Set the temperature control lever to **maximum cooling** position and the blower switch to **HI** position.
4. Open the LO pressure valve (6) of manifold gauge and the can tap valve (1) on refrigerant container and charge the refrigerant until air bubbles in the sight glass of the receiver vanish.
5. After charging the specified amount of refrigerant into the system, close the LO pressure valve (6) of manifold gauge and can tap valve (1), then stop the engine.
6. Check for gas leak with an electric gas leak tester (see page 10-S11).

(Reference)
- Specified amount of refrigerant (total) : 900 to 1000 g (2.0 to 2.2 lbs) [Refrigerant R134a]
- Manifold gauge indication at fully charged system (at ambient temperature : 30 °C (86 °F))
  - HI pressure side : 1.27 to 1.66 MPa  
    - 13 to 17 kgf/cm²  
    - 185 to 242 psi
  - LO pressure side : 0.15 to 0.20 MPa  
    - 1.5 to 2.0 kgf/cm²  
    - 21 to 28 psi

(1) Can Tap Valve  
(2) LO Pressure Gauge  
(3) HI Pressure Gauge  
(4) Compressor (Running)  
(5) HI Pressure Valve (Close)  
(6) LO Pressure Valve (Open)
After charging the refrigerant, check for amount of charging refrigerant as follows.

**NOTE**
- The pressure on the following checking are the gauge indications at ambient temperature 30 °C (86 °F), so it should be noted that the pressure will differ some what with the ambient temperature.

1. Disconnect the 2P connector (4) of magnetic clutch.
2. Start the engine and set a approx. 1500 min⁻¹ (rpm).
3. Connect the 2P connector (4) of magnetic clutch to battery directly, and then set the blower switch to HI position.
4. Leave the system for approx. 5 minutes until the refrigerant cycle becomes stable, keeping pressure on the HI pressure side from 1.27 to 1.66 MPa (13 to 17 kgf/cm², 185 to 242 psi).
5. When the refrigerant cycle is stabilizer, turn off the blower switch and let the compressor alone to run. Then pressure on the LO pressure side gradually drops. At this time, if pressure on the HI pressure side is maintained from 1.27 to 1.66 MPa (13 to 17 kgf/cm², 185 to 242 psi), air bubbles which pass through the sight glass becomes as stated below depending on refrigerant charged amount.

**A : Insufficient refrigerant charge**
Air bubbles pass continuously the sight glass when pressure on the LO pressure side is over 99.0 kPa (1.01 kgf/cm², 14.4 psi). In this case, charge the refrigerant from the LO pressure side.

**B : Properly refrigerant charge**
Air bubbles pass through the sight glass continuously when pressure on the LO pressure side is within 59 to 98 kPa (0.6 to 1.0 kgf/cm², 9 to 14 psi).

If the charge refrigerant amount is proper, no air bubble is observed on the sight glass at pressure on the LO pressure side over 99.0 kPa (1.01 kgf/cm², 14.4 psi) when the blower switch is turned on. When the blower switch is turned off, bubbles pass through the sight glass in case pressure on the LO pressure side is within 59 to 98 kPa (0.6 to 1.0 kgf/cm², 9 to 14 psi).

**C : Excessive refrigerant charge**
Air bubbles pass through the sight glass time to time or no air bubble is observed when pressure on the LO pressure side is under 59 kPa (0.6 kgf/cm², 9 psi).

In this case, discharge excessive refrigerant gradually from the LO pressure side.

6. CHECKING, DISASSEMBLING AND SERVICING

[1] SEPARATING CABIN FROM TRACTOR BODY

### Draining Coolant

**CAUTION**
- Never remove the radiator cap until coolant temperature is well below its boiling point. Then loosen cap slightly to the stop to relieve any excess pressure before removing cap completely.

1. Stop the engine and let cool down.
2. Loosen the drain plug (2) to drain the coolant.
3. Remove the radiator cap to completely drain the coolant.
4. After all coolant is drained, retighten the drain plug (2).

**(When refilling)**
- Fill the coolant between the “FULL” and “LOW” marks of recovery tank (1).

Steering Joint, Brake Pedal Rod and Electric Wiring
1. Remove the tank frame support (2).
2. Remove the universal joint bolt (10) and steering joint support (6), and then remove the steering joint (1).
3. Disconnect the hand accelerator wire and foot accelerator wire (7). (A foot accelerator is not equipped in HST model.)
4. Disconnect the wiring connectors for engine stop solenoid (8), engine tachometer sensor (9) and glow plug.
5. Disconnect the heater hoses (3), and then reconnect their hoses to make loop.

**NOTE**
- Put a mark to the each heater hose before disconnecting.

6. Disconnect the wiring connector for window washer tank (4) and compressor 1P connector (5). (A/C model)
7. Disconnect the brake pedal rod.

**(When reassembling)**
- When accelerator wire is installed, adjust the wiring length as hit both the idling speed adjusting bolt and the maximum speed adjusting bolt by lever within the stroke of the accelerator lever.
- Set the steering joint (1) by the joint support (6) so that the steering wheel is turned lightly.
- Be sure to check and adjust the brake pedal free travel. (See page G-18.)

Clutch Rod, Brake Pedal Rod and Electric Wiring
1. Disconnect the brake pedal rod (6) and clutch rod (4).
2. Disconnect the wiring connectors for alternator (1), coolant temperature sensor (9), oil pressure switch (2), fuel unit (3), starter motor (7) and battery.
3. Remove the clamps and ground earth of wiring harness and collect wiring harness to the step or cabin.
4. Remove the clamps (8) of A/C hoses (5). (A/C model)

**(When reassembling)**
- Be sure to check and adjust the clutch and brake pedal free travel. (See page G-18, 24.)
Seat, Seat Bracket and Lever Grips
1. Remove the seat (1) with seat bracket.
2. Remove the front wheel drive lever (4).

(Manual Transmission Model)
3. Remove the lever grip for position control lever (5), range gear shift lever (2), creep shift lever (7), main shift lever (3).

(GST Model)
3. Remove the lever grip for position control lever (5), draft control lever (6), GST lever (8), creep shift lever (7).

(HST Model)
3. Remove the lever grip for position control lever (5), range gear shift lever (2) and cruise control lever (9).

Differential Lock Rod, Lowering Speed Adjusting Knob and PTO Speed Change Lever (if equipped) (Manual and GST Model)
1. Disconnect the differential lock rod (2).
2. Remove the lowering speed adjusting knob (3).
3. Remove the PTO speed change lever (1) (if equipped).
4. Disconnect the PTO speed sensor (4) (if equipped).

(1) PTO Speed Change Lever (2) Differential Lock Rod (3) Lowering Speed Adjusting Knob (4) PTO Speed Sensor
**Electric Connector for GST**

1. Disconnect the ECU connector (1).
2. Disconnect the GST lever sensor connector (2).
3. Remove the GST valve cover.
4. Disconnect the pressure switch connector (4), proportional reducing valve connector (5), solenoid valve connector (6), oil temperature sensor connector (8) and ground cables (7).

(1) ECU Connector  
(2) GST Lever Sensor Connector  
(3) Wiring Harness of GST Lever Sensor

**PTO Shift Wire, Parking Brake Cable and Connector**

1. Disconnect the parking brake cable (1).
2. Disconnect the PTO shift wire (3) at the PTO clutch valve (5).
3. Disconnect the traveling speed sensor connector (2).

**(When reassembling)**
- Be sure to check and adjust the parking brake lever free play (see page G-27).
- When connecting the PTO shift wire (3) to the clutch valve lever, be sure to adjust the length of wire as follows.

1. Set the PTO shift lever to **OFF (Neutral)** position.
2. Loosen the lock nut (4) of wire, and connect wire to the clutch valve lever, and then place the wire to the hook.
3. Tighten the lock nut (4) clockwise (pull the wire), and lock the nut just before the lever moves.

Air Conditioner Parts (A/C Model)
1. Remove the muffler (2).
2. Remove the air conditioner belt (4) and remove the compressor (1) mounting screw.
3. Remove the recovery tank (6) and window washer tank (7).
4. Disconnect the air cleaner hose (8).
5. Disconnect the recovery tank hose (5).
6. Disconnect the radiator upper hose (3).
7. Remove the oil cooler mounting screw. (HST model only)
8. Remove the battery (10).
9. Remove the battery stay mounting bolt.
10. Take out the compressor (1), condenser (11), receiver (12), hoses (13), battery stay (9) and etc. as a unit.

(When reassembling)
- After reassembling the compressor, be sure to adjust the air conditioner belt tension. (See page G-29.)

Cabin Assembly
1. Remove the outer roof of cabin.
2. Support the cabin with nylon straps (1) and hoists.
3. Loosen and remove the cabin mounting bolts (2) and nuts (9).
4. Dismounting the cabin from tractor body.

■ NOTE
- Lift the cabin while making sure it does not catch on anything.

(When reassembling)
- Be sure to install the washers and mount rubbers, etc. in their original positions.
- Before mounting the cabin, be sure to set both the shuttle lever rod and the shuttle arm to the neutral position, and then connect the shuttle lever rod securely. (GST model)

[2] COMPRESSOR

(1) Checking

**Operation of Magnetic Clutch**
1. Start the engine.
2. Check whether abrasion or abnormal noise is heard when only the magnetic clutch pulley is running while the A/C switch is pushed **OFF**.
3. Check that the magnetic clutch (1) does not slip when the A/C switch and blower switch are turned **ON** (when the air conditioner is in operation).
4. If anything abnormal is found, repair or replace.

**Stator Coil**
1. Measure the resistance of the stator coil with an ohmmeter across the 2P connector.
2. If the measurement is not within the factory specifications, replace the stator coil.

<table>
<thead>
<tr>
<th>Stator coil resistance</th>
<th>Factory spec.</th>

Compressor
1. Discharge the refrigerant from the system. (Refer to “Discharging the System” : See page 10-S17.)
2. Disconnect the low pressure pipe (suction) (2) and high pressure pipe (discharge) (1) from the compressor, then cap the open fittings immediately to keep moisture out of the system.
3. Disconnect the 2P connector (3) of magnetic clutch.
4. Remove the air conditioner belt (4) and remove the compressor (5).

(When reassembling)
- After reassembling the compressor, be sure to adjust the air conditioner belt tension (see page G-29) and recharge the refrigerant to the system. (Refer to “Charging the System” : See page 10-S19.)
- Apply compressor oil (DENSO.CO. ND-OIL8 or equivalent) to the O-rings and take care not to damage them.

(When replacing compressor)
- When replacing the compressor with a new one, meet the oil amount with old one.

[3] AIR CONDITIONER SYSTEM AND FRONT WINDSHIELD WIPER

(1) Checking

(A) Air Conditioner Unit

**A/C Blower Relay and Compressor Relay**
1. Remove the outer roof of cabin, and disconnect the relay connectors.
2. Perform the following checkings 1) and 2).

(1) A/C Blower Relay  (2) Compressor Relay

**1) Connector Voltage**

a) A/C Blower Relay
1. The voltage between the terminal 4 and chassis should be approx. battery voltage.
2. When turning the main switch ON and A/C blower switch to LO position, the voltage between the terminal 2 and chassis should be approx. battery voltage.

b) Compressor Relay
1. The voltage between the terminal 4 and chassis should be 0 V.
2. When turning the main switch ON, A/C blower switch to LO and A/C switch ON, the voltage between the terminal 2 and chassis should be approx. battery voltage.

(1) Connector Side
2) Relay Test
1. Remove the relay (1).
2. Connect the battery (2) and bulb (3) with the relay (1) as shown in the left figure.
3. In this condition, the bulb should light on if the relay is proper.
4. If the bulb light off when disconnecting the jumper lead from the relay terminal 2, the relay is proper.

(1) Relay
(2) Battery
(3) Bulb

A/C Blower Switch
1. Remove the outer roof and disconnect the A/C blower switch connector (1).
2. Perform the following checkings 1) and 2).

(1) A/C Blower Switch Connector

1) Connector Voltage
1. Turn the main switch ON.
2. Measure the voltage with a voltmeter between the connector terminal 4 and terminal 3.
3. If the voltage differs from the battery voltage, the wiring harness, A/C relay, fuse or main switch is faulty.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Terminal 4 – Terminal 3</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
</table>

2) A/C Blower Switch
1. Check the continuity through the switch with an ohmmeter.
2. If the continuity specified below are not indicated, the switch is faulty.

<table>
<thead>
<tr>

(1) A/C Blower Switch
(2) A/C Blower Switch Connector
**A/C Blower Motor Test**

1. Remove the outer roof.
2. Turn the blower motor (2) by hand and check whether it turns smoothly.
3. Disconnect the connector (1) of blower motor (2).
4. Connect a jumper lead from battery (3) positive terminal to terminal B.
5. Connect a jumper lead from battery negative terminal to terminal E momentarily.
6. If the blower motor does not run, check the motor.

<table>

*2 : Push again the A/C switch button to OFF position.

(1) A/C Switch (2) A/C Switch Connector

KiSC issued 02, 2007 A
Pressure Switch

1) HI Pressure Side
1. Connect the manifold gauge (6) to compressor as following procedure.
   Close the HI and LO pressure valves (5), (7) of manifold gauge tightly, and connect the charging hoses (red and blue) (1), (4) to the respective compressor service valves. (Refer to HANDLING OF SERVICE TOOLS : See page 10-S9.)

   **NOTE**
   • Be sure to drive out the air in the charging hoses at the manifold gauge connection end by utilizing the refrigerant pressure in the refrigerant cycle.

2. Start the engine and set at approx. 1500 min⁻¹ (rpm). Turn on the A/C switch, then set the blower switch to HI position.
3. Raise pressure on the HI pressure side of the refrigerant cycle by covering the condenser front with a corrugated cardboard, and the pressure switch (9) is activated and the compressor magnetic clutch is turned off. At this time, read the HI pressure gauge of the manifold gauge. If this pressure reading differs largely with the setting pressure, replace the pressure switch with a new one.

2) LO Pressure Side
1. Disconnect 2P connector of pressure switch.
2. Measure the resistance with an ohmmeter across the connector terminals.
3. If 0 ohm is not indicated at normal condition, there is no refrigerant in the refrigerating cycle because gas leaks or pressure switch is defective.

   (Reference)
   • The resistance of pressure switch is 0 ohm in normal running, but becomes infinity if the pressure is abnormal (out of factory spec.). Because the pressure switch starts to work.

   | Setting pressure | Factory spec. | Pressure switch | More than approx. 3.14 MPa |
   |                 |               | OFF            | 32 kgf/cm² 455 psi       |
   | Factory spec.   |               | OFF            | Less than approx. 0.196 MPa |
   |                 |               | OFF            | 2.0 kgf/cm² 28.4 psi      |

Disassembling and Assembling
(A) Removing Air Conditioner Unit

**Draining Coolant**

**CAUTION**
- Never remove the radiator cap until coolant temperature is well below its boiling point. Then loosen cap slightly to the stop to relieve any excess pressure before removing cap completely.
1. Stop the engine and let cool down.
2. Loosen the drain plug (2) to drain the coolant.
3. Remove the radiator cap to completely drain the coolant.
4. After all coolant is drained, retighten the drain plug (2).

(When refilling)
- Fill the coolant between the “FULL” and “LOW” marks of recovery tank (1).

<table>
<thead>
<tr>

Discharging Refrigerant
1. Refer to “Discharging the System”. (See page 10-S17.)

W1031594
W10646580
W1023185
**Blower Motor and Blower Resistor**
1. Remove the outer roof.
2. Disconnect the battery negative cable.
3. Disconnect the A/C blower motor connector (1).
4. Disconnect the A/C blower resistor connector (2) for A/C blower resistor (3).

(1) A/C Blower Motor Connector  
(2) A/C Blower Resistor Connector  
(3) A/C Blower Resistor

---

**Water Valve Control Cable (White Tape)**
1. When disconnecting the water valve cable (1), follow the next reassembly procedure.

(When reassembling)
- Fully close the water valve (3) and reconnect the cable (1).
- Set the control at **MAX COOL** position. Fit the inner cable in position, and press and fix the outer cable by the cable clip (2) in the direction of arrow (A) as shown at left.
- Move the temperature control lever several times to make sure the water valve is fully closed at **MAX COOL** position.
- Do not allow the water valve cable to bend just away from the control, nor to get caught by the outer roof.

(1) Water Valve Control Cable  
(2) Cable Clip  
(3) Water Valve

---

**KiSC issued 02, 2007 A**
Air Mixing Door Control Cable (Blue Tape)
1. Disconnect the air mixing door control cable (3) from the damper lever (1) of air conditioner control panel side.

(When reassembling)
- Set the damper lever (1) of the air conditioner unit at MAX HOT position. Reconnect the cable.
- Move the control to MAX HOT position. Fit the inner cable in position, and press and fix the outer cable by the cable clip (2) in the direction of arrow (A) as shown at left.
- Move the temperature control lever several times and finally set it to MAX HOT position to make sure the damper lever is at HOT position too.

A/C Mode Door Control Cable (Yellow Tape)
1. Disconnect the air conditioner mode door control cable (3) from the defrosting (DEF) position control lever (1) of A/C control panel side.

(When reassembling)
- Set the air conditioner unit to DEF mode position and reconnect the cable (3).
- Set the control at DEF position. Fit the inner cable in position, and press and fix the outer cable by the cable clip (2) in the direction of arrow (A) as shown at left.
- Move the mode lever several times and finally set it to DEF position to make sure the air conditioner unit is at defrosting (DEF) mode position.
- Lay and fix the mode door control cable over the water valve cable.
Air Conditioning Unit

1. Remove the unit cover (1).
2. Disconnect the heater hoses (5).
3. Disconnect the cooler pipe (liquid) (6) and cooler pipe (suction side) (7).
4. Remove the screws and take off the unit.
5. Remove the duct hoses.

(When reassembling)
- When reconnecting the cooler pipes with the unit, apply compressor oil (DENSO.CO. OIL8 or equivalent) to O-rings.
- When remounting the unit, tighten five screws by hand and finally retighten them after aligning the inner roof duct with the unit duct.
- When connecting the heater hose with A/C unit, hose should be put into the A/C unit pipe more than 30 mm (1.2 in.)

Factory spec. 50 to 70 mm  
1.97 to 2.76 in.
(C) Removing Air Conditioner Pipes (A/C Model)

Discharging Refrigerant
1. Refer to “Discharging the System”. (See page 10-S17.)

Battery, Front Grill, Skirt and Bonnet
1. Open the bonnet and disconnect the battery negative cable.
2. Disconnect the head light connector and remove the front grill (4).
3. Remove the left and right side skirts (3).
4. Disconnect window washer hoses (2).
5. Remove the bonnet (1).

■ NOTE
• When disconnecting the battery cords, disconnect the negative cord first, when connecting, positive cord first.

(1) Bonnet (3) Skirt
(2) Window Washer Hose (4) Front Grill

High Pressure Pipe 1
1. Disconnect the high pressure pipe 1 (2) from the compressor (1) and condenser (3), then cap the open fittings immediately to keep moisture out of the system.

(When reassembling)
• Apply compressor oil (DENSO.CO. ND-OIL 8 or equivalent) to the O-rings and take care not to damage them.

<table>

**High Pressure and Low Pressure Pipes**

1. Remove the outer roof.
2. Disconnect the pressure switch (2) connector.
3. Disconnect the high pressure pipe 2 (3), then cap the open fitting immediately to keep moisture out of the system.
4. Remove the rubber (4) and disconnect the low pressure pipe (1), then cap the open fittings immediately to keep moisture out of the system.
5. Remove the inner covers (5).

*(When reassembling)*
- Replace the rubber (4) with a new one.
- Apply compressor oil (DENSO.CO. ND-OIL 8 or equivalent) to the O-rings and take care not to damage them.

B : LOW
**Blower Motor and Blower Resistor**

1. Remove the outer roof.
2. Disconnect the battery negative cable.
3. Disconnect the blower motor connector (1).
4. Disconnect the blower resistor connector (3) for blower resistor (2).

(1) Blower Motor Connector  
(2) Blower Resistor  
(3) Blower Resistor Connector

**Water Valve Control Cable (White Tape)**

1. When disconnecting the water valve cable (1), follow the next reassembly procedure.

(When reassembling)

- Fully close the water valve (3) and reconnect the cable (1).
- Set the control at MAX COOL position. Fit the inner cable in position, and press and fix the outer cable by the cable clip (2) in the direction of arrow (A) as shown at left.
- Move the temperature control lever several times to make sure the water valve is fully closed at MAX COOL position.
- Do not allow the water valve cable to bend just away from the control, nor to get caught by the outer roof.

Air Mixing Door Control Cable (Blue Tape)
1. Disconnect the air mixing door control cable (3) from the damper lever (1) of air conditioner control panel side.

(When reassembling)
- Set the damper lever (1) of the air conditioner unit at MAX HOT position. Reconnect the cable.
- Move the control to MAX HOT position. Fit the inner cable in position, and press and fix the outer cable by the cable clip (2) in the direction of arrow (A) as shown at left.
- Move the temperature control lever several times and finally set it to MAX HOT position to make sure the damper lever is at HOT position too.

![Image of Air Mixing Door Control Cable](image)

Mode Door Control Cable (Yellow Tape)
1. Disconnect the air conditioner mode door control cable (3) from the defrosting (DEF) position control lever (1) of control panel side.

(When reassembling)
- Set the air conditioner unit to DEF mode position and reconnect the cable (3).
- Set the control at DEF position. Fit the inner cable in position, and press and fix the outer cable by the cable clip (2) in the direction of arrow (A) as shown at left.
- Move the mode lever several times and finally set it to DEF position to make sure to air conditioner unit is at defrosting (DEF) mode position.
- Lay and fix the mode door control cable over the water valve cable.

![Image of Mode Door Control Cable](image)
Air Conditioning Unit

1. Remove the unit cover (1).
2. Disconnect the heater hoses (5).
3. Remove the screws and take off the unit.
4. Remove the duct hoses.

(When reassembling)
- When reconnecting the cooler pipes with the unit, apply compressor oil (DENSO.CO. OIL8 or equivalent) to O-rings.
- When remounting the unit, tighten five screws by hand and finally retighten them after aligning the inner roof duct with the unit duct.
- When connecting the heater hose with heater unit, hose should be put into the heater unit pipe more than 30 mm (1.2 in.)

(1) Heater Core (2) Heater Hoses

Draining Coolant

**CAUTION**
- Never remove the radiator cap until coolant temperature is well below its boiling point. Then loosen cap slightly to the stop to relieve any excess pressure before removing cap completely.

1. Stop the engine and let cool down.
2. Loosen the drain plug (2) to drain the coolant.
3. Remove the radiator cap to completely drain the coolant.
4. After all coolant is drained, retighten the drain plug (2).

(When refilling)
- Fill the coolant between the “FULL” and “LOW” marks of recovery tank (1).

Battery, Front Grill, Skirt and Bonnet
1. Open the bonnet and disconnect the battery negative cable.
2. Disconnect the head light connector and remove the front grill (4).
3. Remove the left and right side skirts (3).
4. Disconnect window washer hoses (2).
5. Remove the bonnet (1).

**NOTE**
- When disconnecting the battery cords, disconnect the negative cord first, when connecting, positive cord first.

Hose Clamp
1. Remove the hose bands (1).
2. Remove the hose clamp (2).

**NOTE**
- Before disconnecting the heater hoses (3), put the parting marks on the hoses for marking proper reconnecting.
3. Disconnect the heater hoses (3), then take out them under the cabin.

(When reassembling)
- Connecting the heater hoses at their original position.

Heater Hoses
1. Remove the outer roof.

**NOTE**
- Before disconnecting the heater hoses (2), put the parting marks on the hoses for marking proper reconnecting.
2. Disconnect the heater hoses (2) from the hose pipes (1).
3. Remove the inner covers (3).
4. Pull out the heater hoses (2) from the bottom of the cabin.
5. Take out the heater hoses (2).

(When reassembling)
- Connect the heater hoses at their original positions.
- In assembling the heater hose (2) to the pipe (1), connect the heater hose with identification mark (white paint) to upper side of the hose pipe.
- When connecting the heater hose with A/C unit, hose should be put into the A/C unit pipe more than 30 mm (1.2 in.).
(3) Servicing
(A) Air Conditioner Unit

Evaporator
1. Check whether while powder or dust is attached to the evaporator (1). If they are attached, wash them off with warm water and blow them off with compressed air.

■ NOTE
- In case the evaporator is cleaned with warm water, cap the evaporator pipe ends so that water does not enter it.

[4] LIGHTING SYSTEM
(1) Checking
(A) Working Light

Working Light Switch
1. Remove the outer roof, and disconnect the working light switch connector (2) from the working light switch (1).
2. Perform the following checkings 1) and 2).

1) Connector Voltage
1. Turn the main switch ON.
2. Measure the voltage with a voltmeter between the terminal 5 and chassis.
3. If the voltage differs from the battery voltage, the wiring harness, fuse or main switch is faulty.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Terminal 5 – Chassis</th>
<th>Approx. battery voltage</th>
</tr>
</thead>
</table>

2) Working Light Switch
1. Check the continuity through the switch with an ohmmeter.
2. If continuity specified below is not indicated.

[5] OTHERS

(1) Disassembling and Assembling

(A) Cabin Windshields

Preparation
1. Prepare the followings.
   - Cutter knife 1 piece
   - Scraper 1 piece
   - Gun for coating 1 piece
   - Sika Tack-Ultrafast or equivalent
   - Gummed tape
   - Sika-Activator
   - Sika primer 209
   - Shin Etsu silicon KE45

■ NOTE
- Sika product are made by Sika Corporation.
- Shin Etsu silicon KE45 is made by Shin Etsu Polymer Corporation.
- These materials can’t be provided by Kubota Corporation.
- Therefore, please find the local made equivalent materials in your country and use them when you need.

Before Replacing Windshields (1)
[In case of using piano wire (When glass is clacked)]
1. Thread the piano wire from the inside of cabin. Tie its both ends to a wooden blocks or the like. (See the left figure.)
2. Pull the piano wire inward/outward alternately to cut the adhered part.

■ NOTE
- Do not let the piano wire make sliding contact with the edge of glass plate forcibly.

[In case of using cutter knife (When glass is totally crushed finely)]
1. Insert the knife (3) into the adhered part.
2. Keep the edge of knife blade square to the glass edge at the part (a). Slide the knife blade along the glass surface and the edge. Pull the part (b) in the direction parallel to the glass edge to cut them off.

■ NOTE
- Find a wider gap between the glass and body.
- Take care of handling the cutter knife not to damage your hand.

(1) Piano Wire (2) Wood Peace (3) Cutter Knife (4) Pulling

Before Replacing Windshields (2)
1. When the Sika Tack-Ultrafast or equivalent attached to the cabin frame and the glass are reused, remove the bond clearly.
2. Clean the frame surface with Sika-Activator.

■ NOTE
- Remove the bond completely.
Before Replacing Windshields (3)

1. Check that the glasses are not damaged and cracked.
2. Turn over the glass and clean this surface of the glass by Sika-Activator.
3. The cleaning area of the rear surface is indicated “A” in the figure left.

**NOTE**
- If not cleaning the glass, it may result in adhesive failure.

Rear Windshield

1. Apply a Sika primer 209 on the cabin frame.
2. Apply a Sika-Activator (3) on the rear windshield shown in figure.
3. Apply a Sika Tack-Ultrafast (2) (or equivalent) on the rear windshield (1) as shown in figure.
4. Install the rear windshield (1) to the cabin and fix it with a gummed tape.
5. Leave it for one hour.

**NOTE**
- Apply the Sika Tack-Ultrafast (or equivalent) with the jig having the specified tip shape as shown in the figure left.
- Apply it with a uniform speed to minimize unevenness.
- Follow the instruction manual of Sika Tack-Ultrafast.
- When the gummed tape is removed the rear windshield may be displaced. In this case fix it again.
- Remove the gummed tape (adhesive tape) little by little to confirm the bonding condition.

(1) Upper Windshield $A : 18$ to $22$ mm ($0.71$ to $0.87$ in.)
(2) Lower Windshield (Left)
(3) Lower Windshield (Right)

---

KiSC issued 02, 2007 A
Front Windshield

**NOTE**
- Apply the Sika Tack-Ultrafast (or equivalent) with the jig having the specified tip shape as shown in the figure left.
- Apply it with a uniform speed to minimize unevenness.
- Follow the instruction manual of Sika Tack-Ultrafast.

1. Apply the Sika Primer 209 on the cabin frame A and B in the figure.
2. Apply the Sika-Activator (5) on the windshield A and B in the figure.
3. Apply the Sika Tack-Ultrafast (4) on the windshield A and B in the figure.
4. Install the lower (left or right) windshield to the cabin and fix it with a gummed tape.
5. Set the upper windshield to the cabin and fix it with a gummed tape.

**NOTE**
- Use a jig (8) shown in the figure to create even clearance E [approx. 5 mm (0.2 in.)] between the lower and upper windshield.
- The level unevenness between the upper and lower windshields should be -1 to +1 mm (-0.04 to +0.04 in.) or less at the windshield surface.

6. Leave it for one hour.
7. Remove the jig (8).
8. Install the H rubber (7) between the lower and upper windshield (2), (3).
9. Apply the Shin Etsu silicon KE45 in H rubber (7).
10. Apply the Shin Etsu silicon KE45 on the edge of H rubber (7).

**NOTE**
- When the gummed tape is removed, the glass may be displaced. In this case fix it again.
- Remove the gummed tape (adhesive tape) little by little to confirm the bonding condition.
